THE ABSTRACT BOOK

Oral Abstract Sessions & Symposia	42
Abstract Award Sessions	43
Oral Abstract Sessions	71
Short Orals	187
Symposia	431
Poster Abstracts	540
A. Ageing	541
B. Motivation and Behavior Change	557
C. Cancer Prevention and Management	601
D. E- & mHealth	617
E. Implementation and Scalability	651
F. Early Care and Education	683
G. Children and Families	697
H. Policies and Environments	755
I. Socio-Economic Inequalities	805
J. Young Adult	829
K. Participatory Research in Health Promotion	849
L. Indigenizing Wellbeing Research	867
M. Systems Science	873
N. Mental Health and Wellbeing	879

HOST CITY

Welcome to Cádiz — The Silver Cup

Cádiz — the oldest continuously inhabited city in Western Europe, on the Atlantic seafront.

Discover the oldest continuously inhabited city in Western Europe. Nestled on a narrow peninsula surrounded by the Atlantic, Cádiz offers ISBNPA 2026 delegates a unique blend of ancient history, vibrant culture and breathtaking coastal views.

Let yourself be captivated by the charm of a city founded by the Phoenicians around 1100 BC. As a historical gateway between the Mediterranean and the Atlantic, it features layered architecture — from the ancient Roman Theatre to the medieval quarter of Barrio del Pópulo and the grand 18th-century watchtowers.

Food & Wine

Cádiz is a paradise for food lovers. Visit the Mercado Central de Abastos, one of Spain's oldest covered markets, to sample coastal specialties at the "Rincón Gastronómico": **Tortillitas de Camarones** (crispy shrimp fritters), **Atún de Almadraba** (world-famous local Bluefin tuna caught using historic Phoenician netting techniques), **Pescaíto Frito** (assorted fresh fried fish served in paper cones) and **Jerez (Sherry)** from the neighbouring vineyards of the legendary Sherry Triangle.

Attractions

The Cathedral — known as the "Cathedral of the Americas" — has golden tiles that shimmer over the ocean, with a 360° panorama from the Poniente Tower. **Castillo de Santa Catalina** is a 17th-century star-shaped fortress with beautiful sunset views over La Caleta, while **Castillo de San Sebastián** is an iconic island fortress reachable via a scenic stone causeway. **La Caleta Beach & Parque Genovés** offer the city's most iconic urban beach beside a historical botanical oasis.

The Cathedral of Cádiz, overlooking the Atlantic.

WELCOME

Welcome Message from the Annual Meeting Committee

On behalf of the Annual Meeting Committee, it is an honor to officially welcome you to the ISBNPA 2026 Annual Meeting — the 25th Annual Meeting of our Society, here in Cádiz, Spain.

We are thrilled to see our global community of researchers, practitioners and advocates come together once again. This meeting is the heartbeat of our Society — a dedicated space where we move beyond the data on our screens to engage in the vibrant, face-to-face exchange of ideas that drives the field of behavioral nutrition and physical activity forward.

Our Shared Vision

This year's program reflects the urgency and evolution of our field. From the smallest behavioral "nudges" to large-scale systemic shifts, we are here to explore how our collective evidence can create a healthier, more equitable world. Over the coming days, we invite you to engage with cutting-edge science during our plenary sessions and symposia; to challenge existing paradigms through spirited debate and collaborative workshops; and to connect with colleagues from across the globe, sparking the partnerships that will lead to the breakthroughs of tomorrow.

Let the Journey Begin

Whether you are here to present your latest findings, learn from the pioneers of our field, or mentor the next generation of scientists, your presence is what makes this meeting a success. We encourage you to immerse yourself in the sessions, participate in the social events, and take full advantage of the wealth of knowledge gathered here.

Thank you for being a part of this journey. We look forward to an unforgettable few days of discovery, inspiration and community.

With warm regards,

ACKNOWLEDGEMENTS

Thank You to Our Reviewers

The Program Committee of the 2026 Annual Meeting of ISBNPA extends its sincere appreciation to all abstract and symposia reviewers. We are grateful for your commitment to advancing behavioral nutrition and physical activity research and for your invaluable contribution to the success of the 2026 Meeting.

PRACTICAL DETAILS

General Information (A-Z)

Everything you need to know during your stay in Cádiz, from arrival to closing ceremony.

BANKING FACILITIES

The currency is the Euro (€). Most shops and restaurants in the city centre and near the Palacio de Congresos accept major credit/debit cards. Several ATMs are located within a 5-minute walk along the Av. del Puerto; currency-exchange offices are available in the historic centre.

CATERING AREA

Catering areas for coffee breaks and lunches are located within the Poster Area at the Palacio de Congresos.

CERTIFICATE OF ATTENDANCE

Certificates of attendance will be made available to all registered participants after the meeting.

CLOSING CEREMONY

Saturday, May 30, 2026, in the Auditorium, from 12:35 PM to 1:15 PM.

CLOAKROOM

Available at the venue. Open Wed, May 27 8:00 AM–8:00 PM; Thu, May 28 8:00 AM–6:15 PM; Fri, May 29 8:00 AM–6:45 PM; Sat, May 30 8:00 AM–1:30 PM.

CODE OF CONDUCT

ISBNPA is committed to a safe and respectful environment. Please silence mobile phones in session rooms, treat all participants, staff and exhibitors with respect, and refrain from any form of harassment or disruptive behavior.

DISABILITIES

The Palacio de Congresos de Cádiz is fully accessible, including ramp access and elevators to all session levels.

EMERGENCY NUMBERS

General Emergency Number (Spain): 112 — connects to police, fire and medical services. First-aid services are available on-site at the registration area.

EXHIBITION AREA

Located in the Main Hall. Open Wed, May 27 1:00 PM–8:00 PM; Thu, May 28 8:30 AM–6:00 PM; Fri, May 29 8:30 AM–6:30 PM; Sat, May 30 8:30 AM–12:00 PM.

FILMING & PHOTOGRAPHY

To protect intellectual property and speaker copyright, filming and photography of presentation slides or posters are prohibited unless explicit permission is granted by the author.

GREENING POLICY

ISBNPA 2026 is dedicated to sustainability: a digital-only program (via App), reduction of single-use plastics, encouragement of public transit or walking between hotels and the venue, and vegetarian and locally sourced catering.

PRE-CONFERENCE PROGRAM

Pre-conference activities take place on Tuesday, May 26 and Wednesday, May 27, 2026 — Satellite Meetings (Tue, May 26), focused symposia organized by ISBNPA Special Interest Groups; and Workshops (Wed, May 27), interactive sessions on specialized methodology or professional development.

INSURANCE & LIABILITY

ISBNPA and the Secretariat (K.I.T. Group) do not accept liability for personal injury or loss of property. Participants are advised to arrange their own travel and health insurance.

LANGUAGE

The official language of the conference is English. No simultaneous translation is provided.

LOST AND FOUND

Lost items should be reported to or collected from the Cloakroom.

NAME BADGE

For security reasons, your name badge must be worn and visible at all times to access scientific sessions, the exhibition and social events. Replacement badges may incur a fee.

OPENING CEREMONY & WELCOME RECEPTION

The Opening Plenary takes place on Wednesday, May 27, 2026, followed by the first Keynote Sessions and the Welcome Reception in the Poster Area. Included in the registration fee for all participants.

PROGRAM CHANGES

The organizers reserve the right to make changes to the program. The most up-to-date schedule is always found in the ISBNPA 2026 Mobile App.

PUBLIC TRANSPORTATION

Cádiz is a very walkable city. For longer distances, the Cercanías (train) and local buses provide efficient service. The main train station (Estación de Cádiz) is adjacent to the Palacio de Congresos.

POSTER AREA

Paper posters are displayed on the Ground Floor of the Palacio de Congresos on Thursday, May 28 and Friday, May 29.

REGISTRATION

The registration counters are open Wed, May 27 8:00 AM–7:00 PM; Thu, May 28 8:00 AM–5:00 PM; Fri, May 29 8:00 AM–5:30 PM; Sat, May 30 8:00 AM–12:30 PM.

SMOKING POLICY

The venue is a smoke-free environment. Smoking is only permitted in designated outdoor areas.

SPEAKER SERVICE CENTER

All speakers must upload their slides at least 2 hours before their session. Location: First Floor, next to the Multipurpose Room. Open Wed, May 27 8:00 AM–6:00 PM; Thu, May 28 8:00 AM–6:15 PM; Fri, May 29 8:00 AM–6:45 PM; Sat, May 30 8:00 AM–12:00 PM.

WI-FI ACCESS

Free Wi-Fi is available throughout the Palacio de Congresos. Network: ISBNPA2026 · Password: Cadiz2026.

BEYOND THE SCIENCE

Social & Networking Events

Beyond the scientific program, ISBNPA 2026 offers a variety of activities designed to help you connect with colleagues, explore the beauty of Cádiz, and maintain your well-being.

1 • ISBNPA 2026 Dinner

Friday, May 29, 2026 • 8:30 PM Baluarte de los Mártires, Av. Dr. Gómez Ulla

Perched on the edge of the historic city walls, the Baluarte de los Mártires offers breathtaking views of the Atlantic Ocean and La Caleta beach. This iconic 19th-century fortress is the perfect backdrop for our signature social event — an evening of authentic Andalusian gastronomy and local culture.

Cost: 100€ (food & beverages included for the whole evening) · Registration required

2 • NESI Social

Thursday, May 28, 2026 • 8:30 PM Paseo Almirante Pascual Pery 4 (Calachica)

Are you a student or early-career researcher looking to connect, chat and unwind? Join us for a casual cocktail with peers in the field.

Cost: 45€ (food & beverages included) · Registration required

3 • Yoga Before Science

Thursday & Friday, May 28–29, 2026 • 7:00 AM Palacio de Congresos

Supported by UCA saludable, this guided session combines breath and movement to awaken the body and focus the mind, releasing tension and organizing energy for the day ahead.

Cost: Free (spots limited) · Registration required

4 • Move Before Sunrise — Social Run

Thursday & Friday, May 28–29, 2026 • 7:00 AM Palacio de Congresos (starting point)

Designed for all fitness levels, this social run offers a steady, accessible pace so you can enjoy the fresh sea air and connect with fellow delegates before the day's sessions begin.

Cost: Free (spots limited) • Registration required

5 • Nautical Activities

Wed, May 27 9:00 AM & 6:00 PM • Thu, May 28 6:00 PM Centro Náutico Puerto Elcano

An opportunity to engage in rowing, kayaking and stand-up paddleboarding (SUP) in the beautiful waters of Cádiz.

Cost: 29€ • Registration required

Local Andalusian gastronomy awaits ISBNPA 2026 delegates.

PLENARY PROGRAM

Keynote Speakers

We are honored to host a prestigious lineup of global experts at ISBNPA 2026. Join us as these leaders in physical activity, nutrition and public health share their latest research and insights into the future of health behavior.

MAY 27 • 5:00 PM–6:00 PM

Moving Forward by Looking Back

Dr. Mark Tremblay

University of Ottawa & CHEO Research Institute, Canada

BIOGRAPHY

Dr. Tremblay is a Senior Scientist with the Healthy Active Living and Obesity (HALO) Research Group at the Children's Hospital of Eastern Ontario Research Institute and Professor of Pediatrics at the University of Ottawa. He is a Fellow of the Canadian Society for Exercise Physiology, the American College of Sports Medicine and the Canadian Academy of Health Sciences, President of the Active Healthy Kids Global Alliance, Founder of the Sedentary Behavior Research Network and President of Outdoor Play Canada. He has published more than 700 scientific papers and book chapters on childhood obesity, physical activity measurement, exercise and sedentary physiology, outdoor play and health surveillance. With an h-index of 115 and over 60,000 citations, he is consistently listed among the top 1% of highly cited researchers in the world.

SESSION FOCUS

A growing number of people today have the opportunity — or misfortune — of living a completely sedentary lifestyle with omnipresent access to calorically dense ultra-processed foods. Global megatrends such as the automation, mechanization and digitization of daily routines have reduced all domains of physical activity and disrupted movement behaviors. Strategies to manage these forces have proven elusive and would benefit from a deeper understanding of foundational temporal changes to behavior. This presentation looks back in time — through cross-cultural comparisons, natural experiments, holistic 24-hour movement approaches and historically rooted behaviors such as active outdoor play — to extract lessons on how to confront and counter-balance lifestyle decay.

MAY 28 • 10:00 AM–11:00 AM

A Sustainable Lifestyle for Improving Human and Planetary Health

Dr. Inge Huybrechts

International Agency for Research on Cancer (IARC), France

BIOGRAPHY

Dr. Inge Huybrechts is a nutritional epidemiologist in the Nutrition and Metabolism Branch at the International Agency for Research on Cancer, where she leads the Sustainable Lifestyle and Cancer Team. She holds a PhD in medical sciences from Ghent University and has more than 20 years of experience in nutritional epidemiology. She has investigated lifestyle causes of non-communicable diseases through observational and intervention studies and is author of more than 400 peer-reviewed papers in nutrition, epidemiology and planetary health. She has built extensive expertise in dietary assessment methodologies across settings and population groups, with particular interest in the adverse health effects of the nutrition transition.

SESSION FOCUS

Dr. Huybrechts' ongoing projects investigate associations between dietary patterns, food biodiversity and cancer risk while considering co-benefits for human health and planetary impact — outlining how sustainable lifestyles can advance both human and planetary health.

MAY 29 • 10:00 AM–11:00 AM

Healthier Diets for All: Behavioral Approaches Across Digital, Retail, and Healthcare Settings

Dr. Carmen Piernas

University of Granada, Spain

BIOGRAPHY

Carmen Piernas is a nutrition scientist and Ramón y Cajal Fellow at the University of Granada. She obtained her PhD in Nutrition and Epidemiology from the University of North Carolina at Chapel Hill and held a University Research Lecturer position at the University of Oxford from 2015 to 2021. Her research focuses on the design, implementation and evaluation of behavioral interventions for the prevention of cardiometabolic diseases. Her current work, grounded in Precision Nutrition, integrates dietary and lifestyle data with multi-omics approaches to improve understanding of individual variability in diet–disease relationships.

SESSION FOCUS

Poor diet is a leading driver of non-communicable diseases, yet population-level dietary change requires effective behavioral approaches embedded within the systems that shape everyday food choices. This keynote examines how behavioral science and digital technologies — from experimental studies in simulated digital platforms and real-world supermarket natural experiments to consumer-facing apps and primary-care interventions using supermarket loyalty-card data — can promote healthier and more sustainable diets across food retail and healthcare settings.

MAY 30 • 11:30 AM–12:35 PM

Joint Actions at National Level to Make Healthy Eating and Physical Activity the Easiest Choices

Dr. Ester Samper & Dr. Santiago Gómez

Spanish Ministry of Health & Gasol Foundation, Spain

BIOGRAPHY

Dr. Ester Samper is a senior technician in the General Sub-Directorate of Health Promotion, Prevention and Equity at the Spanish Ministry of Health, working on national policies on physical activity, nutrition and equity. She holds a degree in Medicine, a Master's in Biomedical Biotechnology and a PhD in Cardiovascular Tissue Engineering. Dr. Santi F. Gómez is Global Director of Research and Programs at the Gasol Foundation. A psychologist with master's degrees in health and community welfare and in public health, and a PhD on childhood obesity, he is PI of the nationally representative PASOS study and Associate Professor at the University of Lleida.

SESSION FOCUS

This joint presentation discusses national-level policy and community interventions designed to integrate healthy habits into daily life, bringing together expertise in community-based obesity prevention and national health policy.

27 - 30 MAY, 2026

EMERGING TALENT

One-to-Watch Invited Talks

The One-to-Watch sessions spotlight exceptional students and early-career researchers making notable contributions to behavioral nutrition and physical activity.

Usman Sani Dankoly

Marie Skłodowska-Curie Doctoral Fellow, Glasgow Caledonian University

BIOGRAPHY

Usman Sani Dankoly is a Marie Skłodowska-Curie Doctoral Fellow in Advanced Behavioral Data Science at Glasgow Caledonian University and part of the LABDA European Doctoral Network. His research sits at the intersection of health inequalities, intersectionality, artificial intelligence, and behavioral science, with a particular focus on how advanced data methods can be used to better understand physical activity and health behaviors across diverse populations. His work combines public health, social theory, and machine learning to address questions of equity in health research. He is particularly interested in how intersectional frameworks can be operationalized in study design, sampling, and analysis, and in how AI can support more inclusive and context-sensitive health research. Alongside his doctoral work, he has experience in natural language processing, large language models, and the analysis of complex behavioral and social data. Usman's broader aim is to develop methods that not only improve scientific rigour, but also help make health research more equitable, representative, and socially meaningful.

PRESENTATION

No Health Equity Without Intersectionality: Rebuilding Sampling, Nomenclature, and Classification from the Ground Up in Behavioral Science

ABSTRACT

We live in a world of deepening health inequalities which are replicated, from the start, in the way we do the science. The tools we use to measure health behaviors, physical activity, sedentary behavior, sleep, the intervention we design, and test have been built by observing about twelve percent of humanity to date. More than ninety percent of participants in behavioral research come from Western, high-income countries. And yet the guidelines, the policies, the interventions, the taxonomies, the measurement tools that come out of that research, we apply them globally. We act as if they're universal, because we think our research generalisable. They are not and the introduction of AI is going to amplify these inequalities. This program of work confronts that assumption at its root. It asks whether the foundational infrastructure of behavioral science: a) how we sample populations, b) how we name and categorize behavior, c) and how we classify behavioral data at scale can be rebuilt to reflect the diversity of human experience rather than a narrow, Western-derived slice of it. Three interconnected objectives structure our work: first, to evaluate the extent to which intersectional sampling has been operationalized in health behavior research; second, to develop a globally grounded nomenclature for human daily behavior derived from how people describe their own lives; and third, to assess and mitigate cultural bias in the large language models used to classify behavioral data across populations. A systematic review of 51,154 records identified just ten studies that designed sampling around intersecting social axes in combination. All originated from high-income, English-speaking countries. None from low- or middle-income settings. The field invokes intersectionality far more than it operationalizes it. To build an alternative foundation for naming behavior, we constructed a multilingual data pipeline drawing on naturalistic "day-in-my-life" video content across 195 countries and approximately 1,200 language-and-region strata, capturing how diverse populations describe their own daily routines in their own terms. Classification at this scale required large language models but these carried the very biases this work seeks to address. Using standard prompts, model precision for identifying daily-life content from non-Western settings was 29%. Content that did not conform to Western behavioral norms was systematically misclassified. Providing the model with culturally grounded context local naming conventions, daily rhythms, linguistic cues — raised precision to 80%, without retraining. If behavioral science is to serve the world's population rather than describe a fraction of it, its foundations: what we sample, what we name, and what our models see — must be rebuilt from the ground up, grounded in the diversity of global human experience, and this demands sustained confrontation with the biases embedded not only in our data and methods but in the very tools we are now turning to for solutions.

Dr. Alejandro Pérez Pérez

Galeno Research Group, University of Cádiz, Spain

BIOGRAPHY

Alejandro Pérez is an Assistant Professor at the University of Cádiz. His research focuses on the interaction between cardiorespiratory fitness, adiposity, and cardiometabolic health. His current interests include exploring bioenergetic approaches to the understanding and interpretation of health-related outcomes.

PRESENTATION

Are We Measuring Health the Wrong Way? Fitness, Adiposity, and Their Interplay

ABSTRACT

This abstract examines the interaction between cardiorespiratory fitness and adiposity, including their mediating and bidirectional relationships in relation to cardiometabolic risk. Building on these findings and drawing on bioenergetic principles and the emerging Energy Resistance framework, the research moves toward a deeper reconsideration of how fitness is defined and expressed in relation to body composition. Fitness is commonly normalized to body weight; however, this approach may not fully capture the dynamic interaction between energy availability and the organism's capacity to dissipate it. Rather than treating fitness and adiposity as independent or competing predictors, this research considers them as interacting components of a broader bioenergetic system. By integrating mechanistic physiology with population-level research, this perspective seeks to refine how fitness and adiposity are quantified and interpreted in relation to health.

Dr. Lisset Pantoja Arévalo

ImFINE Research Group, Universidad Politécnica de Madrid, Spain

BIOGRAPHY

Dr. Lisset Pantoja Arévalo is an Assistant Professor (PhD) at the Universidad Politécnica de Madrid (UPM) in Madrid (Spain), where she integrates Food Science, Nutrition, Molecular Biology, Genetics and Public Health within the ImFINE Research Group in the Department of Health and Human Performance of the School of Physical Activity and Sport Sciences (INEF-UPM). Her work focuses on the intersections between Adverse Reactions to Foodstuffs, Lifestyle, Metabolic Health and Physical Activity, contributing to multidisciplinary biomedical research and academic innovation. She has authored peerreviewed studies indexed in JCR and actively participates in institutional development at INEFUPM. Among the most noteworthy subjects she currently lectures in bachelor's and master's degree programs are: New Perspectives in Nutrition and Public Health, Physical Activity and Public Health, Nutrition and Ergogenic Aids, Health-Food Interaction, Nutrition and Assessment of Physical Condition and Exercise Biochemistry. Her scientific trajectory reflects a strong commitment to evidencebased health promotion and university lecturing excellence.

PRESENTATION

Innovating Adverse Reactions to Foodstuffs (ARFS) Research: Validated Tools, Novel Biomarkers, Substitutive Diet, and Lifestyle Factors

ABSTRACT

Dr. Lisset Pantoja Arévalo, Assistant Professor (PhD) at the Universidad Politécnica de Madrid (UPM), has established a pioneering scientific trajectory in the study of adverse reactions to foodstuffs (ARFS), integrating Nutritional Immunology, Molecular Biology, Nutrition, Genetics, Lifestyle and Sport Science studies. Her work includes the design and validation of two questionnaires that are robust assessment tools, the FBFCARFSQ18 and PSIMPARFSQ10, which demonstrated excellent reliability and content validity for identifying foodrelated triggers and associated symptomatology in the Spanish population. She has contributed to the description of a novel foodallergen-specific biomarker for adults with selfreported ARFS, describing its association with ARFS symptomatology, and contributing to the understanding of immunological patterns underlying these reactions and its relationship with other diseases, signs and symptoms. Her research further proposes a multifactorial diagnostic protocol integrating symptom profiling, biomarker analysis, dietary patterns, body composition, physical fitness and general health parameters, to evaluate the efficacy of a substitutive diet as a strategy to ameliorate ARFSrelated symptoms, as reported in her research articles. She has also characterized ARFS within the context of body composition, physical fitness, and health status, contributing novel insights to the Sport Sciences domain. Beyond her own projects, she collaborates in European initiatives examining nutrition and lifestyle in children with cystic fibrosis and exploring microbiota-ARFS-physical activity interactions. Currently, she is investigating genetic polymorphisms associated with ARFS and their potential links to qualityoflife outcomes, in collaboration with other UPM research facilities such as the Biomedical Technology Center (CTB-UPM) aiming to establish precisionhealth approaches for individuals affected by ARFS. Future research lines include the development of precisionnutrition models and algorithms for ARFS management, the integration of immunological-omicsbased biomarkers into clinical screening, and the inclusion of digital tools capable of monitoring symptoms, dietary exposures, and extrinsic modulators in clinical diagnostic protocols of the public health system or their collaborators. Her longterm vision is to establish an integrative public health nutrition approach including genetics, microbiota, diet quality, physical activity, and symptom expression, ultimately contributing to more effective prevention, diagnosis, and management of ARFS.

Dr. Maria Rodriguez-Ayllon

University of Málaga, Spain

BIOGRAPHY

Maria Rodriguez-Ayllon's research focuses on understanding the role of physical activity in brain, cognitive, and mental health across the lifespan, with a particular emphasis on childhood and adolescence. She obtained her PhD from the University of Granada (Spain) and subsequently held a three-year postdoctoral position in the Department of Epidemiology at Erasmus MC (the Netherlands), where she investigated the mechanisms linking physical activity and mental health, as well as the bidirectional relationship between physical activity and brain health across different cohorts. She recently returned to Spain and joined the University of Malaga, where she was awarded a Ramon y Cajal Fellowship. There, she is establishing her own research line, focusing on the development and implementation of effective and preventive physical activity interventions from primary care settings. She is part of the SAMSERAP research group (Mental Health, Services and Primary Care) at the Biomedical Research Institute of Malaga (IBIMA) and the Movement and Body Composition Lab at the University of Malaga. She currently leads innovative projects such as TeenFit, which aim to identify and evaluate existing physical activity apps for adolescents in Spain and to co-design a website with healthcare professionals, educators, adolescents, and caregivers. This platform will facilitate the selection of physical activity apps tailored to each adolescent's individual needs and preferences. Her long-term mission is to establish a research group focused on preventing mental disorders, such as depression and anxiety, in youth by implementing personalized physical activity and technology-based interventions—key strategies for fostering a healthier, more resilient society.

PRESENTATION

Can Physical Activity Improve Youth Mental Health? From Evidence to Practice

ABSTRACT

A growing body of evidence shows that physical activity has a small but positive effect on mental health. These findings have been consistently confirmed through systematic reviews and meta-analyses conducted by multiple researchers, including Dr. Maria Rodriguez-Ayllon, who will deliver this "One to Watch" talk. Following this evidence, a key goal in the field has been to move beyond demonstrating effectiveness and investigate how these effects can be optimized. In this context, Dr. Rodriguez-Ayllon has explored the mechanisms underlying the relationship between physical activity and mental health in order to identify targets that can enhance intervention effectiveness. To this end, she has collaborated with researchers from different parts of the world to examine neurobiological, psychological, and behavioral mechanisms using diverse methodological approaches, including population-based cohorts, randomized controlled trials, and systematic reviews. Across this work, one of the most consistent and relevant mechanisms identified is self-esteem. Physical activity appears to enhance self-esteem, which in turn may protect young people against mental disorders such as depression and anxiety. These findings suggest that future interventions should move toward more personalized and preference-based approaches to maximize benefits. In this regard, digital interventions represent a promising and cost-effective strategy, with the potential to reach large and diverse populations across different settings. However, an important question remains: do well-validated and effective physical activity apps for improving mental health in young people actually exist? To address this gap, Dr. Rodriguez-Ayllon is currently leading the TeenFit project, whose preliminary findings will be presented in this talk. The project aims to identify and evaluate existing physical activity apps for adolescents in Spain and to co-design a website with healthcare professionals, educators, adolescents, and caregivers. This website aims to facilitate the selection of physical activity apps tailored to adolescents' individual needs and preferences. Ultimately, this presentation will outline future directions for this emerging field.

Dr. Ty Ferguson

ARENA Research Centre, University of Adelaide, Australia

BIOGRAPHY

Ty Ferguson is an early-career Research Fellow at the University of Adelaide and a member of the ARENA research centre. His research focuses on how the weather we experience and the climate we live in shape our day, particularly across physical activity, sedentary behavior, and sleep. He works primarily with large-scale longitudinal wearable datasets, including global data spanning hundreds of thousands of participants and millions of days, to understand behavioral patterns and develop approaches for forecasting how these behaviors may change under future climate conditions. In addition to his climate-focused work, he has expertise in consumer-grade wearable devices and the temporal structure of 24-hour movement behaviors. His research is driven by a focus on future-proofing healthy movement in a changing climate, with an emphasis on generating insights that are both methodologically robust and practically actionable. His work has attracted international attention and is contributing to efforts to position movement behavior epidemiology within a climate forecasting framework.

PRESENTATION

Climate-Responsive Movement Behavior Epidemiology: From Within-Day Patterns to Future Projections

ABSTRACT

Movement behavior epidemiology has undergone a substantial methodological transition, from population surveillance based on brief self-report, to research-grade accelerometry, and more recently to large-scale consumer wearable data. These developments enable the collection of high-resolution, minute-level behavioral data across extended time periods and diverse populations, allowing the temporal structure of behavior across the 24-hour day to be examined in detail. These advances create new opportunities to examine how movement behaviors are shaped by environmental conditions. Associations between weather and 24-hour movement behaviors are increasingly well described, with evidence suggesting that behaviors are not only reduced or increased, but redistributed within the day in response to environmental constraints. In parallel, climate science has long combined observational data with forecasting frameworks to project future conditions under different emissions scenarios. Movement behavior epidemiology is now at a comparable point of development. High-resolution behavioral and environmental data enable both the examination of within-day responses to weather and the estimation of likely daily behavioral patterns based on typical routines and prevailing conditions. Behavioral response functions derived from large-scale global wearable datasets can be integrated with climate projections (e.g., CMIP6/IPCC scenarios) to examine how the timing and distribution of daily behaviors may change under future climates, linking short-term responses with longer-term environmental change. This presentation argues for the development of climate-responsive movement behavior epidemiology as a defined area of research. Establishing this direction will be important for understanding how daily behavior may be reorganised under climate change and for informing the design of environments, policies, and behavioral strategies to support population health

Dr. Jen Gale

Human Potential Research Institute, Auckland University of Technology, New Zealand

BIOGRAPHY

I am a Lecturer in Physical Activity and Nutrition at Auckland University of Technology (AUT), a New Zealand Registered Dietitian, and a researcher within AUT's Human Potential Research Institute. My work sits at the intersection of metabolic health, behavior change, and 24-hour movement behaviors, with a particular focus on how physical activity, sedentary behavior, and sleep collectively influence glycaemic control and cardiometabolic health. I have led and contributed to work spanning physical activity interventions, diabetes technologies, and equity-focused models of care. I am increasingly working in the area of metabolic health and GLP1-based therapies, with a particular interest in how these treatments intersect with nutrition behaviors, physical activity, and longer-term behavior change to support sustainable health outcomes. Alongside my research and teaching, I contribute to professional service as CoChair of the FONS Early Career Taskforce, CoChair of the NESI Workshop & Webinar Subcommittee, and Secretary of the ASPA SIG Committee. I enjoy collaborating across research, clinical, and industry settings and am always open to new connections and collaborations.

PRESENTATION

Opportunities for Behavioral Science in a Changing Metabolic Health Landscape

ABSTRACT

My career has been shaped by opportunities to work across the spectrum of behavioral research, from controlled laboratory experiments to large-scale health delivery systems. This journey has clarified where behavioral science can deliver the greatest impact, and where future opportunities lie. My early experimental work examined the physiological impacts of interrupting sedentary behavior, identifying the evening as a high-risk period for metabolic dysfunction due to prolonged sitting, high energy intake, and reduced insulin sensitivity. We demonstrated that frequent resistance exercise "activity breaks" (three minutes every 30 minutes) reduced postprandial glucose by 31.5% and insulin by 26.6%. Importantly, this work also identified a novel link between evening activity breaks and sleep, with activity breaks extending subsequent sleep duration by approximately 30 minutes. Recognizing the translational potential of these findings, I led a pilot study that used mobile technologies and behavior change theory (COMB) to support freelifing adults to integrate these behaviors into everyday home routines. A further shift occurred as my work expanded into health system delivery through the ACCESS AID Study. Here, the focus moved beyond individual behavior change to addressing systemic barriers, including workforce capacity, geographic isolation, and inequitable access to diabetes care. Through the implementation of a remote "Hub" model and a train-the-trainer framework, this work demonstrates how technology-enabled, multidisciplinary care can build public health capacity while prioritizing communities most in need. Looking ahead, the rise in the use of GLP1 receptor agonists marks a pivotal shift in metabolic health care. However, pharmacological innovation alone is unlikely to deliver equitable long-term outcomes or be accompanied by other health-promoting behaviors. I see a clear opportunity for behavioral researchers to lead in this space by embedding behavioral science within scalable health delivery models. I am deeply grateful to the many colleagues, collaborators, and participants who have contributed across these projects, and I present this work as a reflection of the collective efforts of all those involved.

PRE-CONFERENCE

Pre-Conference Workshops

Pre-conference workshops offer a valuable opportunity to delve deeper into specific topics in behavioral nutrition and physical activity. Date: Wednesday, May 27, 2026 · 8:30 AM–12:30 PM · Palacio de Congresos de Cádiz. Workshops are booked in addition to the conference (50€; 25€ reduced for students and delegates from countries not listed as High-Income).

Network of Early Career Researchers and Students of ISBNPA (NESI) Workshop — Exploring the Ethics and Innovation of AI in Research

Chair(s): Jennifer Gale (Auckland University of Technology) & Emma Ostermeier (University of Manitoba)

A two-part workshop for early career researchers and students. The first session gives practical strategies for integrating AI into research workflows; the second focuses on responsible use, addressing academic integrity, authorship and transparency in AI-assisted outputs. Led by specialists in AI applications for behavior-change research and journal editors, with hands-on activities and peer networking.

Engaging Young Minds in Systems Science: Co-Creating Maps for Movement and Behavior Change

Chair(s): Anne Martin (University of Glasgow)

A dynamic 4-hour session exploring how systems mapping can engage children and young people in understanding the complex factors that influence physical activity. Grounded in child-centred, participatory design, it offers practical tools, real-world case studies and role-play simulations to embed children's voices in systems research.

Bridging the Digital Health Divide: Practical Considerations for the Design and Evaluation of Digital Nutrition and Physical Activity Interventions

Chair(s): Kathryn M. Ross (Advocate Aurora Research Institute, Wake Forest University School of Medicine)

Pragmatic considerations in the design and evaluation of inclusive, scalable digital health interventions. Participants discuss intervention design, trial recruitment and retention, and outcomes analysis, with emphasis on actionable insights and accounting for social inequality indicators to avoid widening health disparities.

The Art and Science of Storytelling for Health: Narrative Tools to Advance Behavioral Nutrition and Physical Activity

Chair(s): Monica Wang (Boston University School of Public Health; Harvard T.H. Chan School of Public Health)

Practical narrative tools to communicate science with clarity, authenticity and impact. Drawing on the book 'The Collective Cure', participants identify the elements of an effective health story, tailor messages for diverse audiences, and integrate storytelling into interventions through guided writing, 'story labs', mini pitches and peer feedback.

Physical Activity Policy Implementation: Measures, Methods and Means of Evaluation

Chair(s): Catherine Woods (Physical Activity for Health Research Centre, University of Limerick)

Sharing learnings from the Policy Evaluation Network (PEN) and the IMPAQT ERA4Health project. Attendees gain hands-on experience using the PA-Environment Policy Index to assess implementation of national PA policies, compare against international best practice, and create feasible recommendations.

Introduction to Social Network Analysis in Physical Activity and Nutrition

Chair(s): Tyler Prochnow (Texas A&M University)

An introduction to the theory and application of social network analysis (SNA) in health-behavior research — analyzing connections within systems, from organizational ties in health coalitions to friendship ties and program adoption. No prior knowledge of SNA or data analysis is required.

Techquity: Democratizing Behavioral Nutrition and Physical Activity Research through Digital Literacy and Technology Capacity Building

Chair(s): Jasmin Bhawra (Toronto Metropolitan University)

Addresses inequities caused by expensive proprietary digital tools by introducing 'techquity'. Participants learn to use CloneApp, a device-agnostic progressive web application, to build customised mobile research tools for activity tracking, dietary assessment and intervention monitoring while maintaining data sovereignty.

The Pulse of Youth Fitness: Global Insights into Surveillance, Measurement, and Interventions

Chair(s): Dr. Justin Lang (Public Health Agency of Canada)

A deep dive into emerging global research in youth fitness surveillance, assessment and intervention. Explores how simple, cost-effective and scalable fitness assessment can complement physical activity surveillance, temporal trends, school-based assessment strategies, and the value of fitness outcomes in interventions.

Sustaining Wellbeing through Mentorship and Intergenerational Knowledge Exchange: Indigenous Perspectives from Turtle Island, Abya Yala and Aotearoa

Chair(s): Dave Bergeron (Université du Québec à Rimouski, Canada)

An Indigenous-led workshop grounded in concepts of wellbeing (Whānau Ora, Buen Vivir, Kaswentha). Through talking circles, small-group dialogues and short 'igniter' presentations, Elders/Knowledge Keepers, Indigenous trainees and allied researchers reflect on how land, language, food systems and movement shape health, and co-identify research and mentorship priorities.

The Next Step: Adapting and Implementing Interventions in a Real-World Context

Chair(s): Marla Hahnrahts (CAPHRI, Maastricht University)

Practical tools to identify and define the core components of interventions that must remain intact during adaptation and scale-up. Using real-world examples such as SuperFIT and the SWAP IT Healthy School Lunchbox program, participants apply concepts to their own intervention in small subgroups.

Novel Approaches to Modeling Intraindividual Variability and Coupling in Intensive Longitudinal Data with Open-Source MixWILD Software

Chair(s): Wei-Lin Wang (University of Southern California)

State-of-the-science statistical approaches using open-source MixWILD software for modeling intraindividual means, variances and slopes from intensive longitudinal data. Includes illustrative applications and hands-on demonstrations for integrating the method into participants' own workflows.

Environments in Action: Field-Based Training in Observational and Audit Tools in Cádiz

Chair(s): [Nicole den Braver \(Amsterdam University Medical Centre\)](#)

A field-based workshop training participants to use environmental audit and behavioral observation tools across Cádiz's walkable streets, coastal promenades and historic districts. Small groups rotate through field sites applying five validated tools in a 'comparison challenge', exploring interdisciplinary adaptability for PA and nutrition research.

RECOGNIZING EXCELLENCE

Award Nominees

Congratulations to all nominees in the ISBNPA 2026 Award Sessions. Award sessions take place on Wednesday, May 27, 2026, 3:30 PM–4:45 PM.

Awards 1 • Cancer Prevention and Management / Mental Health and Well-being • Wed, May 27 • 3:30 PM–4:45 PM

CANCER PREVENTION AND MANAGEMENT

344	Manon Gouez Centre Léon Bérard	Feasibility and Preliminary Efficacy of Aerobic Acute Exercise Prior Chemo-immunotherapy Infusion in Patients with Metastatic Non-small Cell Lung Cancer: A Randomized Controlled Trial

INTERACTIVE SESSIONS

Dare-2-Share Sessions

Dare2Share sessions promote interactive, participatory and innovative engagement beyond traditional symposia — fostering collaboration, mentorship and meaningful dialogue. Sessions last up to 80 minutes.

DS.1.01 Meditation practices in the school health promotion program, SI! Program

DESCRIPTION

The SI! Program is a school holistic-health promotion intervention aimed at children aged 6 to 12 years. In the latest version of the program, we propose the incorporation of a new intervention based on meditation practices. This component is designed to foster greater self-awareness and emotional regulation, with the goal of improving attitudes and behaviors ultimately supporting the development of healthier lifestyle habits, particularly regarding diet, physical activity, sleep and sedentary lifestyle.

The session will begin with brief introduction to the SI! Program, including an overview of the main challenges currently faced in achieving long-term sustainability. In this context, the rationale for incorporating meditation-based resources will be presented, highlighting their potential to increase awareness and enhance behavioral regulation through intrinsic motivation and personal self-care.

This will be followed by an experiential role-playing activity designed to facilitate the exchange of ideas regarding tools, implementation strategies, and potential challenges. As part of this activity, participants will engage in a guided meditation practice to directly experience how these resources can be integrated into the program.

The session will conclude with a collective reflection and presentation of the main ideas, challenges, and opportunities identified, focusing on this new version of the program and its potential impact.

SESSION PROGRAM

Session Coordinator: Carla Rodríguez Caballero (Madrid, Spain)

Entering the Ecosystem: A Story of Origins and Evolution

· Gloria Santos-Beneit (Barcelona, Spain)

Making Sense Together: Live Insight Mapping and Final Remarks

· Xavier Òrrit (Barcelona, Spain) · Carla Rodríguez Caballero (Madrid, Spain)

DS.1.03 Working with "messy" implementation data in real-world settings; A brainstorming session

DESCRIPTION

Dissemination and Implementation (D&I) research seeks to accelerate the translation from research to practice to improve nutrition and physical activity outcomes and ultimately enhance population health. With a growing focus on D&I research, researchers and practitioners need ways to capture implementation of evidence-based nutrition and physical activity programs/policies "on the ground" in addition to more traditional implementation outcomes such as adoption, fidelity, and sustainability which are often gathered through survey data.

This is important as researchers cannot rely solely on surveys and interviews with implementers; many key facilitators/challenges to implementation are often missed because field notes and observation data are not prioritized in the same way as outcome data.

This session will bring together researchers and practitioners working in a large array of settings (e.g., healthcare, schools, communities, policy) to brainstorm pragmatic ways to organize and interpret data collected during site visits and informal interviews.

The facilitators (working in United States and Australia) will share the ways they are currently working with data gathered through observations, informal conversations, and other documentation during site visits as part of ongoing implementation-effectiveness trials. This will facilitate

brainstorming of common practices that could be adopted by ISBNPA researchers and practitioners to work with “messy” implementation data to increase efficiency and rigor of implementation data analysis.

Brainstorm session, In-person session, 75 minutes

SESSION PROGRAM

Session Coordinator: Gabriella McLoughlin (Philadelphia, United States)

Introductions and overview of session goals

· Gabriella McLoughlin (Philadelphia, United States)

Presentations

· Nicole Nathan (Newcastle, Australia) · Gabriella McLoughlin (Philadelphia, United States)

DS.2.04 Psychedelics, Health Behaviors, and Public Health

DESCRIPTION

We propose a session focused on the growing body of research examining interventions and therapies that incorporate guided experiences of altered states of consciousness—often, though not exclusively, involving psychedelic substances—in the context of mental, physical, and behavioral/preventive health.

The session will begin with a brief state-of-the-art overview of current research in this area, with particular emphasis on studies exploring the relationship between psychedelic experiences and health behavior change. This overview will be followed by a small number of selected first-person testimonials from participants in such interventions, presented either live or via recorded video.

The second half of the session will consist of an open discussion on the increasing mainstreaming of psychedelics. Topics will include fear and stigma, the evolving regulatory landscape, and the training and professionalization of practitioners. The discussion will also consider the implications of these developments for research and practice at both individual and population levels.

The session will be split between tutorial, testimonials, and discussion parts. Participation from the audience will be encouraged throughout. More details above.

SESSION PROGRAM

Session Coordinator: Jorge Encantado (Lisboa, Portugal)

DS.2.05 Prioritizing Climate Action Research: Identifying New Research Priorities for ISBNPA Members

DESCRIPTION

The purpose of this session is to support ISBNPA researchers with identifying new research priorities within behavioral nutrition and physical activity research that intersect with our commitment to planetary health.

A Fuzzy Cognitive Mapping session will be conducted with members to identify opportunities for our researchers to lead innovative projects that support behavior change that is aligned with our commitment to planetary health. Participants will be co-authors on the report generated and submitted to the Executive Committee.

SESSION PROGRAM

Session Coordinator: Shilpa Dogra (Oshawa, Canada)

Introduction

· Shilpa Dogra (Oshawa, Canada)

Group Workshops

· Ty Ferguson (Adelaide, Australia)

DS.2.07 What Should We Call the 24-Hour Cycle of Physical Activity, Sedentary Behavior, and Sleep? A Symposium on Terminology, Implications, and Global Perspectives

DESCRIPTION

Concurrently examining physical activity, sedentary behavior, and sleep is rapidly gaining traction in research, policy, and public health. However, variation in terminology across disciplines, cultures, and regions creates confusion and limits comparability, equity, and knowledge translation globally.

This #Dare2Share session seeks to bring together researchers, practitioners, and stakeholders from different countries and disciplines to engage in a collective brainstorming and creative dialogue aimed at harmonizing language, surfacing cultural/contextual considerations, and laying groundwork for a globally applicable, inclusive framework. The goal is not simply to present research, but to collaboratively generate ideas, build networks, and foster future cross-national collaborations. In addition, as part of this session, we will share the initial results of the Around the Clock Terminology Consortium's (ACT-C's) ongoing consensus which is aiming to develop internationally agreed upon terminology for concurrently discussing physical activity, sedentary behavior, and sleep.

We propose a 75 minute in-person participatory session featuring the following elements:

- Opening “flash context” (5 min): A brief framing of the 24-hour paradigm, the current challenge of inconsistent terminology and how the Around the Clock Terminology Consortium is working to tackle it.
- World Café / small-group breakout discussion (20 min): Participants are divided into 4–6 small, diverse groups by geography, discipline, and career stage. Each group addresses a series of guiding questions (e.g., “Which terms have you used or seen?”, “What are the pros/cons?”, “What cultural or regional factors matter?”).
- Group synthesis & idea generation (20 min): Each group summarizes key points and suggests potential candidate terms, principles for selecting terminology, or cultural/contextual caveats.
- Plenary creative mapping & consensus building (20 min): Use a digital board (if available) to map out proposed terminology frameworks, noting where consensus exists and where regional/contextual variation may be warranted.
- Networking and commitment to next steps (10 min): Discuss the ongoing Around the Clock Terminology Consortium (ACT-C) – an initiative aiming to resolve these issues, and also potential future research needed beyond this project.

Throughout the session, chairs/facilitators will encourage open participation, cross-disciplinary exchange, and collaborative problem-solving.

SESSION PROGRAM

Session Coordinator: Ryan Stanley Falck (Vancouver, Canada)

Introduction

• Ryan Stanley Falck (Vancouver, Canada)

Small-Group Breakout Discussion

• Ryan Stanley Falck (Vancouver, Canada) • António L. Palmeira (Lisboa, Portugal) • Esther Cerin (Melbourne, Australia)

Group Synthesis and Idea Mapping

Summary and Networking

DS.2.08 Recruiting and Retaining Students for School-Based Intervention Research

DESCRIPTION

Schools are an important venue for intervention and recruitment in nutrition and physical activity research. Recruiting students from schools in the U.S. has become increasingly difficult due to concerns about privacy and data sharing. Recently, we received a seven-year NIH grant to develop and test an innovative public-private partnership between primary schools and grocery stores to promote fruit and vegetable consumption. For this project, we will test three recruitment strategies (social media, recruitment from grocery stores, and traditional parent outreach through schools) to identify 400–600 children and parents per year for five years. We invite other teams to share their strategies for recruiting children and parents from low-income, racially and ethnically diverse families outside of school settings.

In this session, we will share our recruitment strategies and engage audience members working in this area, including those facing similar challenges internationally, to “dare to share” experiences and best practices. After a short presentation where we frame the issue in the international context (10 minutes), based on audience interest, three small groups will be formed to discuss the three approaches and discuss challenges particular to their situation and propose ideas and innovations for successful recruitment and retention (35 minutes). In the last 15 minutes the groups will come together to share and document ideas and discuss. We will then have a moderated question and answer session and end with top ideas and innovations for different contexts, for example grade vs high school (15 minutes).

SESSION PROGRAM

Session Coordinators: Punam Ohri-Vachaspati (United States) · Marc Adams (United States)

DS.2.09 Beyond the Screening: Co-Designing Food Security Solutions in Prenatal Care

DESCRIPTION

Food insecurity during pregnancy is linked to poorer nutrition, higher stress and depression, and adverse birth outcomes. Yet even as more clinics integrate screening, few offer immediate, household-level solutions. Our team at Women & Infants Hospital piloted a meal delivery program for food-insecure pregnant patients - offering ready-to-eat, balanced meals for the entire household. Feedback revealed improved nutrition and reduced stress.

In this Dare2Share session, we invite participants to step into the lived experience of food insecurity and collaboratively reimagine how healthcare systems can respond in a variety of cultural contexts. Through storytelling, “empathy-mapping”, and design “sprints”, participants will explore barriers and opportunities to integrating food support into prenatal care. The session blends evidence from our ongoing study with creative, co-design activities that build new connections and practical ideas for research and implementation.

Participants will leave with a draft “Food Security in Pregnancy Toolkit” - a set of research questions, program concepts, and partnership pathways that can be carried forward into new collaborations.

By the end of the session, participants will:

- Understand the lived experience and clinical implications of food insecurity in pregnancy.
- Co-create innovative, culturally responsive and equitable strategies for addressing food insecurity through clinical-community partnerships.
- Network and collaborate with others interested in maternal nutrition, mental health, and social determinants of health research.

Proposed Format (75 minutes):

- Opening & Framing (10 min)
- Short storytelling presentation and overview of the Food Insecurity in Pregnancy Project 2.0, emphasizing real-world context and patient perspectives.
- Empathy & Experience (15 min)
- Participants engage in “food journey” mapping using provided “personas” - identifying barriers, emotions, and system gaps from the perspective of pregnant patients and families.
- Creative Design Sprint (30 min)
- Small groups brainstorm and prototype practical interventions (clinic workflows, partnerships, data tools, or policy approaches) to improve food security support during prenatal care.
- Connection Carousel (10 min)
- “Speed-sharing” among groups to cross-pollinate ideas, build connections, and identify shared research interests.
- “Harvest & Commit” (10 min)
- Groups share key insights. Collective development of a “Food Security in Pregnancy Toolkit” (compiled post-session and shared digitally with all participants).

Expected Outcomes:

- A participant-generated toolkit of practical ideas, measures, and collaboration opportunities.
- New interdisciplinary partnerships focused on food insecurity and perinatal health.
- Broader awareness of how empathy-driven design can improve equity in clinical interventions.

SESSION PROGRAM

Session Coordinators: Jon Olansen (Providence, RI, United States) · Janet Lefkowitz (Providence, United States)

Opening

· Jon Olansen (Providence, RI, United States) · Janet Lefkowitz (Providence, United States)

Empathetic Framing

· Janet Lefkowitz (Providence, United States)

Design Sprint

· Janet Lefkowitz (Providence, United States) · Jon Olansen (Providence, RI, United States)

Roundtable

Commitment Renewal and Closing

DS.3.10 A human-centred design approach to tackling challenges and creating solutions for healthy eating and physical activity.

DESCRIPTION

WHAT:

- Expose delegates to a problem-solving approach that brings together diverse perspectives, expertise, and creativity to generate new ideas and solutions collaboratively within the public health space, specifically physical activity and nutrition. It will create a space that emphasizes active participation, shared ownership, and leveraging collective knowledge to address complex challenges within the public health space, specifically related to physical activity and nutrition.

WHY:

- Generates more creative and effective solutions that are environmentally, socially, and economically sustainable.
- Encourages stakeholder buy-in and shared accountability by collaborating early and identifying the primary end-user.
- Enhances adaptability and resilience to changes.
- Builds stronger relationships and trust among participants by highlighting a shared vision.

HOW:

This will be an interactive session and will be initiated on Day 1 of the conference. The session will be limited to 20 conference attendees.

On Day 1 of the conference delegates signed up for the session will be asked to locate the three "Build-It" boxes, which will have a prompt for each:

- Any underlying problem/need/insight: Example, lack of safe spaces to exercise
- Any users/target group/specific group of people: Example, adolescents
- Any setting/context/constraints: Example, live in under-resourced community in Cape Town, South Africa

Session delegates will be asked to write a note for each box using the prompts and drop the completed notes into the box anytime between Day 1 and Day 2.

Session Day:

On Day 3, the session delegates will start the session within the given space, set-up in a way that is conducive to team activities. The session will start with a brief introduction to human-centred design (HCD) followed by creating groups among session delegates. Each group will start with some psychological safety exercises before they jump into the co-creation activities.

Groups will be asked to randomly and blindly select a note from each box and collectively create a challenge statement to work on. Once the statement is created the team will have an opportunity to explore the statement using some HCD tools.

Brainstorming techniques will be shared before the teams dive into creating ideas and finally a solution that they can prototype. During the prototyping component teams will have access to Lego and craft material such as: pipe cleaners and cardboard paper to create the low fidelity prototypes that can be tested.

Session delegates will have the opportunity to do a quick test with other delegates that they find at the conference venue to provide the team with some structured feedback. The teams will then incorporate the feedback and share their iterated solution with the session delegates. After sharing of prototypes, the session will close off by providing a space for delegates to offer their support to initiate collaborations with others or if they would want to start one (or many) of the proposed solutions.

Interactive – team building

SESSION PROGRAM

Session Coordinators: Zulfa Albertyn-Blanchard (Cape Town, South Africa) · Estelle. V. Lambert (Cape Town, South Africa)

Participants will be working in groups

Introduction presentation

Workshop activities

DS.3.11 Elevating Culinary Nutrition Research

DESCRIPTION

Culinary nutrition is an interdisciplinary field that integrates food procurement and cooking with nutrition science to promote healthy eating behaviors and improve overall health and well-being. Emphasizing practical, culturally relevant and age-appropriate approaches, culinary nutrition aims to promote sustainable, dietary patterns often aligning with food-based dietary guideline (FBDGs) recommendations. Brazilian and Canadian FBDGs explicitly refer to cooking in their recommendations. However, barriers to cooking are complex and can include time constraints, nutrition insecurity, limited cooking and food skills, and the convenience and ubiquity of energy dense and nutrient poor foods.

Despite its significance and potential to improve nutrition-related health and well-being, culinary nutrition research is plagued with methodological weaknesses that limit its impact. These challenges underscore the need for robust research methods to inform effective interventions, education strategies and policies. Strengthening the science behind culinary nutrition will enable evidence-based approaches to foster enhanced credibility, impact, innovation and availability of resources for culinary nutrition science.

The proposed #Dare2Share session will commence with a brief introduction to set the scene, highlighting the current state and gaps in culinary nutrition research. Following this participants will break into facilitated interactive small-group brainstorming sessions to identify and discuss high-priority areas for methodological improvement.

Discussion topics may include:

- Conducting exploratory and participatory research in culinary nutrition to understand community needs, lived experiences, and contextual barriers before designing interventions
- Designing culinary nutrition education programs for impact
- Evaluating changes in cooking behavior – designing and implementing brief, validated measures
- Food systems, workplace culture and policy levers to support home cooking
- Research designs to capture real-world implementation of programs that aim to support cooking-related behavior change
- Culinary nutrition research funding challenges and opportunities

Groups will generate actionable ideas for research collaborations and cross-disciplinary partnerships. The session is not limited to people within the field of culinary nutrition.

All delegates with relevant insights to offer are invited. Outputs will be synthesized fostering connections and sparking future research initiatives. This session embodies the spirit of #Dare2Share by creating a dynamic, participatory environment that will connect researchers in a creative space to design solutions that elevate culinary nutrition science and practice.

Face to face, presentations followed by interactive small group discussions

SESSION PROGRAM

Session Coordinator: Julia Wolfson (Baltimore, United States)

Welcome and opening presentations

• Tamara Bucher (Bern, Australia) • Fiona Lavelle (London, United Kingdom)

Discussion groups

• Joyce Haddad (Bern, Switzerland) • Tamara Bucher (Bern, Australia) • Fiona Lavelle (London, United Kingdom)

Sharing and questions

SAVE THE DATE

ISBNPA 2027 • Halifax, Canada

The 26th ISBNPA Annual Meeting will take place in Halifax, Canada, from June 16–19, 2027. We look forward to welcoming the global community to Nova Scotia's vibrant coastal capital to continue advancing behavior-change science.

SCHEDULE

Program at a Glance

The full, searchable scientific program — including all symposia, oral and short-oral sessions, posters and room allocations — is available online at isbnpa2026.abstractserver.com/program.

Session Formats at a Glance

Workshops — interactive 4-hour sessions for hands-on skill development. **One-to-Watch** — 30-minute spotlights on emerging researchers. **Symposia** — 75-minute sessions: 10-min chair introduction, three 15-min presentations and a 20-min discussant-led discussion. **Symposia Debates / Two-Presentation Symposia** — 10-min introduction, two 20-min presentations and a 25-min moderated debate. **Dare-2-Share** — creative, participatory sessions up to 80 minutes. **Oral Presentations (incl. Award Sessions)** — 10 minutes plus 2 minutes discussion. **Short Orals** — 5 minutes plus 1 minute discussion. **Poster Viewing** — posters displayed across the three meeting days, with dedicated viewing sessions on Thursday and Friday.

Feasibility and Preliminary Efficacy of Aerobic Acute Exercise Prior Chemo-immunotherapy Infusion in Patients with Metastatic Non-small Cell Lung Cancer: A Randomized Controlled Trial

M. Gouez¹, O. Pérol¹, V. Pialoux², M. Pérol³, B. Fervers¹

¹Centre Léon Bérard, Cancer Prevention and Environment, Lyon, France, ²Université Claude Bernard Lyon 1, Inter-University Laboratory of Human Movement Biology, Lyon, France, ³Centre Léon Bérard, Medical Oncology Department, Lyon, France

AA.01: Awards 1: Cancer Prevention and Management / Mental Health and Well being
Room 1, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Recent preclinical evidence indicates that acute exercise induces immune modulation and enhance tumor blood perfusion, potentially improving cancer treatment efficacy. Integrating exercise with chemo-immunotherapy (ChemoIO) treatment may therefore represent a novel behavioral strategy to improve therapeutic outcomes in metastatic non-small cell lung cancer (mNSCLC). The ERICA trial (NCT04676009) aimed to assess the feasibility, safety and preliminary effects of performing acute aerobic exercise performed immediately before the administration of ChemoIO in patients with mNSCLC. Secondary aims were to explore the intervention's impact on physical activity levels, cardiopulmonary fitness, muscle strength, body composition, patient-reported outcomes (PROs), and treatment completion rates.

Methods: Newly diagnosed mNSCLC patients were randomly assigned (2:1) to the exercise or control group. The exercise intervention included supervised acute exercise before each of four ChemoIO cycles plus a 3-month home-based walking program with an activity tracker and step goals. Feasibility outcomes included adherence, acceptability, tolerability, and safety. Secondary endpoints were assessed at baseline and after 3 months using objective and self-reported measures of physical activity behavior, cardiorespiratory fitness, muscle strength, body composition, and PROs (fatigue, quality of sleep, and quality of life).

Results: Twenty-six patients (mean age 60.6 years; SD 10.65) participated, with a 90.9% acceptance rate. In the exercise group (n=17), 80.9% of the participants completed acute exercise sessions, with a median interval of 38 minutes [IQR, 20-60] between exercise and ChemoIO. No exercise-related adverse effects were reported. After 3 months, 60% of the participants in the exercise group were classified as 'active' and maintained their step goals. The participants reported maintaining physical fitness, reducing fatigue, improving quality of life, and decreasing insomnia.

Conclusion: Acute aerobic exercise performed immediately before ChemoIO is feasible, acceptable, and safe in patients with mNSCLC. This innovative integration of exercise into cancer management, represents a promising, non-pharmacologic strategy to enhance therapeutic response and patient well-being. Larger trials are warranted to evaluate its efficacy on clinical outcomes and biological mechanisms.

AA.01-2

Cross-lagged Panel Analysis of Physical Activity, Physical Fitness, Executive Functions, and Arithmetic Fluency in Adolescents

F. Martín-Acosta¹, F.J. Bandera-Campos¹, M. González-Pérez¹, F.N. Souza-Marabotto², A. Grao-Cruces¹, D. Camiletti-Moirón¹

¹University of Cadiz, Department of Physical Education, Puerto Real, Spain, ²University of Republica, Rivera, Uruguay

AA.01: Awards 1: Cancer Prevention and Management / Mental Health and Well being
Room 1, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: The relationship between physical health and academic outcomes in adolescents is well-established, but the complex directionality and reciprocal nature of these associations remain unclear. Given the foundational role of mathematical skills in overall academic success, the central research question addressed was: What are the dynamic and reciprocal predictive relationships among moderate-to-vigorous physical activity (MVPA), physical fitness (PF), core executive functions (EF), and arithmetic fluency (AF) over a seven-month lag during a school year? This study offers a novel contribution by rigorously testing a dynamic longitudinal model that simultaneously accounts for key physical health factors (MVPA and PF), EF and AF, examining their bidirectional and dynamic interrelations over time.

ABSTRACT AWARD SESSIONS

Methods: Participants were 1,156 Spanish adolescents (aged 12–14 years) evaluated in a repeated-measure design over a seven-month interval (Time 1 and Time 2). MVPA was assessed using Actigraph GT3X+ devices. PF components (cardiorespiratory fitness (CRF) and strength) were determined through 20-m shuttle run, hand grip, and standing broad jump, respectively. Core EF (inhibition, cognitive flexibility, working memory) were assessed using the computerized-based NIH Examiner Battery. AF was measured with Test 6 of the Woodcock protocol. Cross-lagged panel models were employed to examine the predictive relationships between T1 and T2 variables, adjusting for potential confounding variables including age, sex, and socioeconomic status at T1.

Results: Cross-lagged panel models showed significant temporal stability for all main variables. Crucially, baseline general PF significantly predicted both subsequent EF ($\beta = 0.104, p < 0.001$) and AF ($\beta = 0.040, p < 0.05$) seven months later. A robust reciprocal relationship was consistently identified between EF and AF over time ($\beta = 0.132, p < 0.001$). When analyzing specific components, CRF at T1 predicted both EF and AF at T2, whereas strength T1 predicted EF but not AF. MVPA at T1 did not significantly predict general PF, EF, or AF at T2.

Conclusion: These findings underscore the foundational importance of PF, particularly CRF health, and EF as dynamic, longitudinal predictors of mathematical achievement in adolescence. The results strongly advocate for educational strategies that integrate the promotion of PF to foster cognitive development and, consequently, enhance mathematical skills.

Sun Protection Behaviours at the Beach: Real-time Insights to Inform Skin Cancer Prevention in Spain

K. Sargeant Rivilla¹, M. Revilla¹, C. Ochoa¹

¹RECSM, Universitat Pompeu Fabra, Barcelona, Spain

AA.01: Awards 1: Cancer Prevention and Management / Mental Health and Well being
Room 1, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Skin cancer rates continue rising globally, with age-standardised melanoma rates in Spain rising from 8.85 per 100,000 in 2014 to 18.50 per 100,000 in 2023. Sun protection represents a critical cancer preventive strategy, yet adherence to recommended measures remains suboptimal, particularly among beachgoers, who face heightened UV exposure. This study examines the behavioural determinants of sun protection behaviours among Spanish beachgoers to inform cancer prevention interventions. The research employs a geolocation-triggered survey methodology to capture real-time behaviours.

Methods: Beachgoers (N=454) were surveyed in the Netquest geolocated panel during summer 2024 using in-the-moment surveys triggered by GPS data one hour after detecting arrival at one of Spain's 2,480 mainland beaches, minimising recall bias and social desirability while gathering event-specific data on sun protection behaviours. The survey data was complemented with meteorological data (UV biologically effective dose and temperature). Using Structural Equation Modelling (SEM), we identified the pathways through which knowledge, attitudes, environmental factors, and demographics influence sunscreen usage.

Results: While 78% of beachgoers used sunscreen and 83% demonstrated accurate knowledge about UV risks, significant gaps persist in comprehensive protection. Only 7% wore protective clothing, and only 28% held favourable attitudes toward sunscreen texture, undermining reapplication. SEM analysis revealed that attitudes toward sun protection emerged as the strongest predictor of sunscreen usage, followed by water contact and sunscreen texture attitudes. Environmental factors showed significant effects: cloudiness reduced sunscreen use directly and indirectly by reducing UV levels, while UV radiation modestly increased protection. Positive tanning attitudes negatively affected usage, yet positive sun exposure attitudes increased sunscreen use. Temperature influenced protection indirectly by increasing water contact. Knowledge showed no direct effect on behaviour, and female gender was the only significant demographic predictor.

Conclusion: These results suggest that effective skin cancer prevention may require moving beyond knowledge-based approaches to attitude-change interventions. Public health campaigns should emphasize that UV risks persist despite cloud cover and leverage water contact as a behavioural trigger for reapplication, while addressing sunscreen texture concerns to improve adherence. This research provides insights for designing cancer prevention strategies among high-risk populations, demonstrating how innovative behavioural data collection methods can inform interventions that reduce skin cancer incidence.

Impact of Motivational Factors and Sleep Quality on Daily Physical Activity in Cancer Survivors

Y. Liao¹, H. Aghajani¹, C.-H. Yang², S. Makhnoon³, J. Maher⁴, K. Basen-Engquist⁵

¹University of Texas at Arlington, Kinesiology, Arlington, United States, ²University of South Carolina, Columbia, United States, ³University of Texas Southwestern Medical Center, Dallas, United States, ⁴University of North Carolina Greensboro, Greensboro, United States, ⁵University of Texas MD Anderson Cancer Center, Houston, United States

AA.01: Awards 1: Cancer Prevention and Management / Mental Health and Well being
Room 1, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Regular physical activity (PA) offers many health benefits to cancer survivors. To promote an active lifestyle, PA interventions often target motivational factors such as self-efficacy (SE), outcome expectancy (OE), intention, and goal setting. In addition to these cognitive factors, emerging evidence shows sleep quality could affect PA. However, it is unclear if sleep quality influences cancer survivors' motivational determinants for PA. This pilot study tested the impact of SE, OE, intention, and goal setting on subsequent PA levels, and if sleep quality influences these relationships in cancer survivors using real-time data capture methods.

Methods: This analysis included data from 17 cancer survivors who wore an accelerometer on their non-dominant wrist and answered daily morning survey via a smartphone app over a 30-day period. The survey included questions regarding sleep quality LAST NIGHT, and SE, OE, intention, goal setting related to PA TODAY. Multilevel regression model was used to separate the within-person (WP) and between-person (BP) effects of motivational factors on total daily step counts. The WP and BP moderating effects of sleep quality were evaluated by adding single-level and cross-level interaction terms.

Results: Participants were 94% female, 24% Hispanic. Average age was 55 years (range: 39-74). Average daily step counts at person-level were 8,722 (range: 2,443-14,743). Intraclass correlation was lowest for SE (0.390) and highest for OE (0.704); suggesting variations in SE mainly came from changes within participants from day to day while variation in OE mainly came from differences between participants. SE and intention in the morning were positively associated with total steps that day (WP ps <.05), and these associations were not moderated by sleep quality. Sleep quality moderated the association between goal setting and steps (WP interaction <.05). When participants had worse sleep than their usual, goal setting was positively associated with total steps that day. Neither OE in the morning nor the interaction between OE and sleep quality was associated with steps that day.

Conclusion: Sleep quality may moderate the effects of certain motivational determinants in PA in cancer survivors. PA interventions need to consider the impact of sleep when attempting to strengthen relations between motivation and health behavior.

AA.01-6

Active Play, Restraint and Screen Time Are Associated with Mental Health Outcomes in British 1-4-year-Olds

K. Hesketh¹, M. Sweeney¹, E. van Sluijs², H. Dodd³

¹University College London, London, United Kingdom, ²University of Cambridge, Cambridge, United Kingdom, ³University of Exeter, Exeter, United Kingdom

AA.01: Awards 1: Cancer Prevention and Management / Mental Health and Well being
Room 1, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Increasingly, young children have fewer opportunities for active play and spend more time restrained (e.g. in strollers, car seats) and watching screens. Concurrently, 10% of British children have a diagnosable mental health (MH) condition. Active play (i.e. physically active play) contributes to under-5s physical activity (guideline: ≥180 minutes/day) and may help to prevent MH problems, but is unexplored in under-5s. This study investigated how active play, restraint and screen time were associated with MH outcomes in British preschoolers.

Methods: Data were from a nationally representative sample of British caregivers of 1-4-year-olds, recruited via a public opinion company (YouGov, April 2025). Three exposures and four outcomes were derived from parent-report questionnaires, using validated measures. Exposures were time a child spent (in hours/day): i) playing actively; ii) restrained (in a car seat, stroller or highchair) and iii) watching screens. Outcomes were: internalising (INT) and

ABSTRACT AWARD SESSIONS

externalising (EXT) scores (using the Strengths and Difficulties Questionnaire (SDQ)); and positive and negative affect scores (using the Positive and Negative Affect Schedule for Children-P). Linear regression was used to explore associations between the three exposures and four outcomes; interactions between exposures were tested. Models were adjusted for child gender, ethnicity, age, childcare (hours/week), parent education, geographic region and urbanicity.

Results: Care-givers of 1,982 children (51% male; mean age (SD): 2.6(1.0) years; 78% white) provided valid data. On average, children engaged in active play for 4.3(2.2) hours/day, were restrained for 2.7(1.9) hours/day and watched screens for 1.7(1.4) hours/day; 68% of children engaged in active play for ≥ 180 minutes/day. For each additional hour/day a child engaged in active play, they had lower internalising scores [beta: -0.08 (95%CI: -0.14, -0.02)] and higher positive affect [0.14 (0.06, 0.21)]. Greater time spent restrained and watching screens was associated with poorer mental health outcomes, although the magnitude of associations was too small to be meaningfully interpreted. No interactions were identified.

Conclusion: More active play was associated with better MH outcomes in British preschoolers, whereas more time spent in restraint and watching screens was associated with poorer MH. Ensuring children have ample opportunities for active play, from an early age, may support positive mental health outcomes.

AA.02: Awards 2: Socio-Economic Inequalities and Indigenizing Research
Room 2, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Having a lower socioeconomic status (SES) is associated with poorer dietary habits and fewer family meals. The “Dinner is served at 1-2-3 euros” (DS123) intervention, developed by a Belgian retailer in collaboration with social organizations, aims to support socioeconomically vulnerable families in cooking more home-made meals through two-weekly recipe booklets combined with a price incentive. This study first explored participants’ and stakeholders’ experiences to identify success factors and areas for improvement, and second, examined the intervention’s effect on food choices using purchase data.

Methods: For the first objective, a mixed-methods design combining qualitative (focus groups and interviews) and quantitative research (surveys) was used. The process evaluation framework developed by Saunders et al. (2005) guided the data collection, and thematic analysis was applied for data analysis. For the second objective, a longitudinal within-group pre-post design analyzed food purchase data (n = 260,214 transactions) from 134 participating lower SES households over four and a half years. Binomial generalized linear mixed models were used to assess changes in the proportion of total food budgets spent on vegetables, prepackaged meals, and sweet and salty snacks.

Results: By July 2023, the intervention had reached 9,400 participants via 315 social organizations. Most participants joined for financial or inspirational reasons. Recipe booklets were used variably and were valued for their clarity, affordability, and child-friendly tips. Many participants reported eating healthier and enjoying cooking more. Social organizations were generally satisfied with their collaboration with the retailer. Purchase data showed that enrollment increased the odds of spending more on vegetables (OR = 1.119), and less on prepackaged meals (OR = 0.810) and snacks (OR = 0.851). Higher adherence strengthened these effects, with more recipe booklet products bought associated with greater vegetable spending (OR = 1.089) and reduced spending on prepackaged foods (OR = 0.934) and snack foods (OR = 0.965). Effects slightly declined or stabilized over time.

Conclusion: The intervention effectively promoted healthier, budget-friendly meal preparation among low-SES households by increasing vegetable use and cooking inspiration. Combining individual and structural strategies within a public-private partnership shows promise for sustainably reducing health and nutrition inequalities.

Identifying Facilitators and Barriers to Traditional Foods Use and Consumption for Native American Families Living in Urban Settings

A. Crusan¹, M. McCue-Enser², A. Evans¹, A. Hanratty¹, K. Johnston-Goodstar³, A. Stately⁴, M. Allen⁵

¹St. Catherine University, Nutrition & Dietetics, St. Paul, United States, ²St. Catherine University, Communication Studies, St. Paul, United States, ³University of Minnesota, Social Work, Minneapolis, United States, ⁴Native American Community Clinic, Minneapolis, United States, ⁵University of Minnesota, Family Medicine and Community Health, Minneapolis, United States

AA.02: Awards 2: Socio-Economic Inequalities and Indigenizing Research

Room 2, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Cultural relevance is essential in designing effective interventions. Nutrition and physical activity interventions integrating traditional foods and practices supported by community knowledge have shown promise in improving health outcomes for Native American communities. However, there is a gap in the research regarding community use of traditional foods, in particular amongst Native American populations living in urban environments. The objective of this study is to identify facilitators and barriers to use and consumption of traditional foods across tribal affiliations living in urban settings in Minnesota (United States).

Methods: Semi-structured interviews promoting storytelling and conversational methods were conducted with leaders in food sovereignty advocacy in Minnesota from multiple Indigenous organizations and diverse tribal affiliations represented in the metropolitan area. The Visiting Way was also used to challenge the interviewer's reflexivity with both themselves and the interviewee. As an Indigenous partnered project, the approach of Two-Eyed Seeing was promoted to encourage worldview through an Indigenous lens and a Western lens. The transcripts were analyzed to preserve Indigenous ways of knowing, comparing and contrasting collective stories to preserve the integrity of the shared relationships within the conversation.

Results: Twelve interviews (1 male, 9 female, 2 non-binary) were reviewed and compared to identify facilitators such as the importance of community connections and cultural collectivism via sharing of traditions and knowledge across generations. The leaders spoke of the strong desire to integrate more traditional foods into diet patterns and the flexibility the community offers each other to meet people where they are at with knowledge of preparing and eating traditional foods. Barriers within the urban environment included challenges in sharing of generational knowledge (e.g. groups were "elders" "youth" only), shifts in access to community connections (organizations working in silos because of competitive funding), and decreased land access in urban settings. Moreover, leaders noted disproportionate rates of poverty that can affect food access, transportation, and individual involvement in the community.

Conclusion: A stronger understanding of ways to facilitate access and generational knowledge, while reducing barriers to accessing and consuming traditional foods in urban settings is needed to improve health outcomes for Native American communities.

AA.02-3

Conceptualising the Role of Kai for Hinengaro among Rangatahi Māori

O. Young¹, H. Rapata², N. Gillies¹

¹University of Auckland, Nutrition and Dietetics, Auckland, New Zealand, ²Te Wānanga o Aotearoa, Auckland, New Zealand

AA.02: Awards 2: Socio-Economic Inequalities and Indigenizing Research

Room 2, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Mental health is a significant health concern for rangatahi (young people) in Aotearoa New Zealand, especially rangatahi Māori, with rates of depression symptoms doubling between 2012-2019, and inequities continuing to widen. The role of nutrition in mental wellbeing is an emerging area, although it is primarily grounded in Western paradigms. Limited research explores the relationship between kai (food) and mental wellbeing seen through a te ao Māori lens. The aim of this research is to conceptualise the role of kai in supporting mental wellbeing among rangatahi Māori who have experienced mental health challenges.

Methods: This project utilises Participatory Action Research methodologies informed by kaupapa Māori principles of

ABSTRACT AWARD SESSIONS

whanaungatanga (relationships), manaakitanga (respect) and tino rangatiratanga (self-determination). Researchers partnered with The Kindness Institute, an organisation that supports wellbeing through kaupapa Māori-aligned programs. Photovoice was used to explore rangatahi perspectives, values and beliefs around kai and their mental wellbeing in response to three questions - “what does kai mean to you?”, “what role does kai play in your mental wellbeing?” and “what helps you or makes it hard for you when it comes to kai?”. Five young Māori women (aged 19-23) participated in this activity, followed by a focus group discussion to explore their photographs and the research topic in greater depth. Themes were developed through Reflexive Thematic Analysis.

Results: Final themes were generated under the overarching theme of ‘Nā te kai ka ora’, through kai, there is wellbeing – reflecting that kai is more than just food and nutrients. Within this, four themes were developed - ‘Kai hei Haerenga, Kai hei Oranga’ (*Kai as a journey, kai as wellbeing*), ‘Ko te Kai he Taura Here’ (*Kai as the Binding Cord*), Kai i te Ao Matihiko’ (*Kai in the Digital World*) and ‘He ara kai, He ara hinengaro’ (*Kai as a pathway to mental wellbeing*).

Conclusion: This study has developed a deeper understanding of what is important for the mental wellbeing of rangatahi Māori in relation to kai. From this, kai-based approaches that centre and value Māori culture and beliefs can be developed to support the mental wellbeing of rangatahi Māori.

AA.02-5

Social and Physical Environments Shaping Healthy Diet and Physical Activity Behaviours among Ethnic Minority Communities in the UK Populations

R. Farayola¹, C. Aienobe-Asekharen¹, H. Osei-Kwasi¹

¹Loughborough University, School of Sport, Exercise and Health Sciences, Loughborough, United Kingdom

AA.02: Awards 2: Socio-Economic Inequalities and Indigenizing Research

Room 2, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Ethnic minority groups in the UK experience persistent inequalities in diet and physical activity, yet limited evidence describes the specific social and physical environments that enable healthier practices in these communities. This study explored opportunities within the social and physical environments that enable and support the adoption of healthy diet and physical activity behaviours among African and Caribbean communities in the UK.

Methods: Qualitative study using semi-structured interviews with fifteen community leaders of African and Caribbean origin, from different sectors (e.g. charity and religious organisations) in Greater Manchester and Leicestershire. Participants were recruited through purposive and snowball sampling, supported by community referrals and targeted social media outreach. Data were analysed using reflexive thematic analysis to identify opportunities that facilitate a healthy diet and physical activity.

Results: Two key opportunities influenced the adoption of healthy diet and physical activity behaviours among ethnic minority communities in the UK. Community and social support systems played a central role, with third sector and faith-based organisations providing trusted spaces and culturally relevant activities for healthy living. Support was reinforced through family and friends, and through digital community groups on social media, e.g., WhatsApp and YouTube, which offered encouragement, shared information, and a sense of togetherness. However, engagement with the wider physical environment (e.g., parks, public facilities) was limited unless prompted by a specific need or event. Professional health support (e.g. GPs and nurses) was sought mainly when a health condition required medical attention, or when trust had been established through personal relationships.

Conclusion: Opportunities for adopting a healthy diet and physical activity in ethnic minority groups are largely supported primarily through third sector organisations and social-digital peer networks, while NHS and professional support are accessed mainly when trust or health needs are present. This study highlights these community and digital networks as key opportunity pathways and underscores the value of stronger collaboration between the NHS, third sector and peer support networks to enhance cultural relevance and sustainability of health interventions.

Associations between Mental Distress, Lifestyle Factors, and Ultra-processed Food Consumption among Adults with Diabetes in Dakar, Senegal: A Cross-sectional Study

J. Edjimbi^{1,2}, S. Diombo Kébé³, N. Idohou-Dossou³, A. Diouf³, B. Gaye⁴, C. Lassale^{2,5}

¹LifeBridge Health, Baltimore, United States, ²ISGlobal Barcelona Institute for Global Health, Environment and Health over the Lifecourse, Barcelona, Spain, ³Laboratoire de Recherche en Nutrition et Alimentation Humaine, Dakar, Senegal, ⁴Alliance for Medical Research in Africa (AMedRA), Dakar, Senegal, ⁵Universitat Pompeu Fabra, Barcelona, Spain

AA.02: Awards 2: Socio-Economic Inequalities and Indigenizing Research
Room 2, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: In urban Sub-Saharan Africa, the nutrition transition is fueling a dual burden of westernization of the diet and rise of non-communicable diseases including type 2 diabetes (T2D). This study investigated the association between mental distress, lifestyle factors, and ultra-processed food (UPF) consumption.

Methods: We conducted a cross-sectional study including 174 adults with diabetes recruited at Marc Sankalé Diabetology Center in Dakar, Senegal. Mental distress was assessed using the Self-Reporting Questionnaire, 20-item version (SRQ-20) and UPF consumption via a 23-item NOVA-based checklist. A UPF score was created as the number of different UPF products consumed during the previous 24 hours, ranging 0 to 23. Multivariate linear regression, adjusted for age, sex, and residence, examined associations with the UPF Score.

Results: Participants (mean age: 54.9 years; 75.9% female) had a high prevalence of probable mental distress (41.4%, SRQ-20 ≥ 8). Overall, 92.5% consumed at least one UPF category. The most commonly reported products were “bouillon cubes” (stock) and industrial flavorings (83.3%), followed by sweetened powdered drinks (56.3%), instant milk/chocolate powders (53.4%), spreadable cheese (53.4%), industrial bread (47.1%), and processed condiments like mayonnaise or ketchup (39.1%). Less frequently consumed were items such as sugary soft drinks, cookies, and instant noodles. A significant inverse association was found between mental distress and UPF intake; higher SRQ-20 scores (i.e. more mental distress) were associated with a lower variety of consumed UPF products ($\beta = -0.238$, 95% CI: -0.372 to -0.105, $p < 0.001$). In contrast, higher BMI ($\beta = 0.110$, $p = 0.011$) and male sex ($\beta = 1.140$, $p = 0.037$) were associated with a higher number of UPF products consumed.

Conclusion: Contrary to common assumptions, higher mental distress in this population of patients with diabetes was linked to more restricted UPF consumption, possibly reflecting diabetes-specific distress prompting dietary caution. Observed gender disparities and the normalization of specific UPFs like bouillon underscore key sociocultural drivers. Findings advocate for integrated T2D management in Senegal that includes mental health support and culturally-attuned nutritional guidance to mitigate the impacts of the nutrition transition.

AA.03-1

Predicting a Physical Activity Identity: Evidence from a Prospective Model

M. Smith¹, A.S.Y. Lee¹, R.E. Rhodes¹, C. Brennan¹

¹University of Victoria, Victoria, Canada

AA.03: Awards 3: Motivation and e and mHealth
Room 3, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Physical activity (PA) identity is a robust correlate of PA, yet its formative antecedents are seldom quantified within a single explanatory model. This study tested an integrated conceptual model proposing that five distal factors—relatedness, personal investment, perceived capability, PA alignment, and priority—shape subsequent PA identity through behavioral enactment and self-regulatory experiences in community-dwelling adults.

Methods: We used a prospective, two-wave online survey across three weeks with Canadian adults aged 19–65 (T1 N=570; T2 n=389; 68.2% retention). Baseline measures included weekly moderate-to-vigorous PA (MVPA) assessed with a modified Godin Leisure-Time Exercise Questionnaire; four self-regulatory processes from the Physical Activity Regulation Scale (proactive regulation, reactive regulation, social monitoring, self-monitoring); and the five distal antecedents. PA identity was assessed three weeks later using the exercise identity scale. The conceptual model was evaluated via structural equation modeling (Mplus 7.2) using full-information maximum likelihood; model adequacy was judged by χ^2 , CFI, TLI, RMSEA, and SRMR, and indirect effects were estimated to test mediation.

ABSTRACT AWARD SESSIONS

Results: Model fit was good: $\chi^2(324)=795.92$, CFI=.95, TLI=.95, RMSEA=.05 (90% CI .05-.06), SRMR=.07. PA identity at T2 showed significant direct effects from T1 MVPA ($\beta=.17$, $p<.01$), reactive regulation ($\beta=.34$, $p<.01$), and self-monitoring ($\beta=.18$, $p<.01$), together with smaller direct effects from relatedness ($\beta=.11$, $p=.01$), perceived capability ($\beta=.12$, $p=.04$), alignment ($\beta=.12$, $p=.04$), and priority ($\beta=.13$, $p=.04$). The model accounted for 73% of the variance in PA identity. Significant indirect effects were observed for relatedness ($\beta=.09$) primarily via MVPA ($\beta=.02$) and reactive regulation ($\beta=.07$); for personal investment ($\beta=.18$) via MVPA ($\beta=.04$), reactive regulation ($\beta=.10$), and self-monitoring ($\beta=.07$); for priority ($\beta=.15$) via MVPA ($\beta=.05$), reactive regulation ($\beta=.09$), and self-monitoring ($\beta=.03$); and for perceived capability ($\beta=.02$) via MVPA ($\beta=.02$).

Conclusion: PA identity appears to develop through both behavioral enactment and self-regulatory experiences, with reactive regulation and self-monitoring emerging as prominent, independent levers. Distal social-cognitive factors also contribute directly and through these mediators. Quantifying multiple pathways prospectively identifies precise targets for identity-focused PA interventions and provides an empirically grounded specification for experimental tests of identity change.

Is Taking the Weekend off a Good Idea? An Experimental Test of Dietary Self-monitoring Schedules on Adherence and Effectiveness

L.M. König¹, R.A. Krukowski², M.J. Western³, A. Ruf¹

¹University of Vienna, Faculty of Psychology, Vienna, Austria, ²University of Virginia, Department of Public Health Sciences, Charlottesville, United States, ³University of Bath, Department for Health, Bath, United Kingdom

AA.03: Awards 3: Motivation and e and mHealth

Room 3, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Self-monitoring is an effective behaviour change technique. Yet, adherence to daily dietary self-monitoring is low, especially on weekends that lack routine. In this study, we experimentally compared three dietary self-monitoring schedules (20 random days on any day; 20 random days only Monday to Friday; 20 self-selected days) to test whether explicitly prompting individuals to (not) self-monitor on weekends influences adherence and fruit and vegetable consumption, and whether adherence and changes in fruit and vegetable consumption are related.

Methods: Participants ($N = 159$; 73.6% women; mean age 24.5 years; mean Body-Mass Index 23.7 kg/m²) used a digital dietary self-monitoring app for a month, being asked to self-monitor on twenty out of thirty days following a pre-specified schedule to which they were randomly assigned. They self-reported average portions of fruits and vegetables consumed per day in the previous week before and after the intervention. Adherence was operationalised as the number of days with at least one self-monitoring entry.

Results: Adherence was high (mean 17.7 out of 20 days; 89%) and did not differ between the three experimental groups, $F(2, 156) = 1.83$, $p = .163$. Following up this finding, we found that relative adherence was, across groups, higher on weekdays ($M = 89\%$, $SD = 17\%$) than on weekends ($M = 83\%$, $SD = 23\%$), $t(100) = 3.20$, $p = .002$, Cohen's $d = 0.32$. Fruit and vegetable consumption increased from 2.6 ($SD = 1.0$) to 3.3 ($SD = 1.1$) portions per day from pre to post intervention, $F(1, 156) = 40.37$, $p < .001$, but these changes did not differ between experimental groups, $F(2, 156) = 1.09$, $p = .339$. Adherence and changes in fruit and vegetable consumption were unrelated, $r(158) = .12$, $p = .124$.

Conclusion: Dietary self-monitoring is effective in increasing fruit and vegetable consumption. Although adherence was somewhat higher on weekdays compared to weekends, instructing users to not self-monitor on weekends did not significantly improve adherence overall, potentially because adherence was high. Furthermore, adherence was unrelated to intervention effectiveness, suggesting that also relatively infrequent self-monitoring of only half of the days in a month or less may induce meaningful effects.

A Person-centered Analysis of Intuitive Eating and Motivation Reveals an Adaptive Intuitive Eater Profile Linked to Positive Body Image and Dietary Outcomes

T. Sire^{1,2}, É. Carbonneau^{2,3,4}, R. Lacerte^{1,2}, L. Vermette^{1,2}, N. Carbonneau^{1,2}

¹Université du Québec à Trois-Rivières, Psychology, Trois-Rivières, Canada, ²Institute of Nutrition and Functional Foods (INAF), Québec, Canada, ³Université Laval, School of Nutrition, Québec, Canada, ⁴Centre Nutrition, Santé et Société (NUTRISS), Québec, Canada

AA.03: Awards 3: Motivation and e and mHealth
Room 3, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Intuitive eating (IE) is a positive and non-restrictive approach to eating that involves responding to the body's internal cues without judgment or rigid rules. Four dimensions of IE are distinguished: unconditional permission to eat, eating for physical rather than emotional reasons, reliance on hunger and satiety cues, and body-food choice congruence. Most studies on IE have used variable-centered analyses, which do not allow for an examination of how these dimensions combine to form distinct eating profiles. The present study aimed to (1) identify latent profiles based on the four IE dimensions and three types of motivation to regulate eating, and (2) assess whether profile membership was associated with body esteem, eating behaviors, and diet quality.

Methods: A total of 2,088 Canadian adults (65% women) completed online questionnaires assessing: IE (Intuitive Eating Scale-3); autonomous motivation, controlled motivation, and amotivation (Regulation of Eating Behavior Scale); body esteem (Body Esteem Scale); cognitive restraint, emotional eating, and uncontrolled eating (Three-Factor Eating Questionnaire); and overall diet quality (Canadian Food Intake Screener). Latent profile analyses using robust maximum likelihood estimation tested two- to four-profile models. One-way ANOVAs were conducted to compare profiles on body esteem, eating behaviors, and diet quality.

Results: The four-profile solution provided the best statistical and theoretical fit. Profile 1 (Disconnected eaters) showed low IE, high amotivation and controlled motivation, and moderate autonomous motivation. Profile 2 (Balanced eaters) displayed moderate-to-high IE with a mix of autonomous and controlled motivation. Profile 3 (Adaptive intuitive eaters) exhibited the highest IE, combined with high autonomous motivation, along with low amotivation and controlled motivation. Profile 4 (Multimotivated intuitive eaters) showed high IE with moderate-to-high levels of autonomous motivation, controlled motivation, and amotivation. Adaptive intuitive eaters reported significantly higher body esteem and diet quality, as well as lower cognitive restraint, uncontrolled eating, and emotional eating, compared to all other profiles.

Conclusion: These findings reveal that similar levels of IE can be accompanied by different forms of motivation, leading to distinct eating and body image outcomes. Fostering IE in combination with autonomous motivation may represent a promising avenue for promoting a healthier relationship with one's body and food.

AA.03-4

Developing Competencies for Using Behavioral Intervention Technologies to Support Self-management in Patients with Chronic Joint Disorders

N. van der Spek¹, M. de Rooij^{1,2}, S. Kramer³, A. Feleus⁴, M. van der Leeden⁵, B. Visser^{1,6}, M. van der Esch^{2,1}, D. Bossen¹

Purpose: Behavioral Intervention Technologies (BITs), including mobile applications and online platforms that are designed to promote self-management, are valuable tools to support individuals with chronic joint disorders. Despite

ABSTRACT AWARD SESSIONS

their potential, healthcare professionals remain uncertain about how to effectively integrate BITs into clinical practice to enhance self-management, particularly in combination with face-to-face guidance. The aim of this study was to identify and describe the competencies required by physiotherapists and exercise therapists to effectively use BITs in supporting self-management among patients with chronic joint disorders.

Methods: The concept mapping method was used to gain insight into the competencies required to use BITs. Therapists (n=9) and patient partners (n=8) individually generated ideas in response to a predefined statement “*What does a therapist need to know and do to use apps and wearables in such a way that the patient will use them to reduce the impact of their condition*”. The participants then shared and refined ideas during group brainstorming sessions. The ideas were transformed into competencies and learning objectives using the Five-A-Model (Glasgow et al., 2003). Two meetings were held with nine experts in the fields of health technology, self-management and education. In the first meeting, the panel reviewed and refined the draft competencies. In the second meeting, the experts finalized these competencies. The resulting framework was ultimately validated by two therapists.

Results: Therapists generated 80 statements and patient partners 68. After merging duplicates, 27 unique statements remained. The first expert meeting resulted in a preliminary framework consisting of four competencies and 21 learning objectives. In the second expert meeting, the classification and naming were discussed and refined. After validation by two therapists, the final framework comprises four core competencies and 19 learning objectives. These competencies are: (1) being open to change behavior and adapting work processes, (2) assessing the suitability of BITs for individuals, (3) collaboratively selecting and personalizing BITs and (4) coaching patients toward independent use.

Conclusion: Building on these competencies, a 10-week blended learning module is being developed to support therapists in using BITs to promote self-management in patients with chronic joint disorders. The AMSOS learning module will be presented at the ISBNPA Congress.

Room 3, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Excessive time spent sitting has been associated with poorer kidney health; however, most studies focus on absolute sitting time, ignoring the co-dependence among other daily time-use behaviours. We examined the cross-sectional associations of estimated glomerular filtration rate (eGFR) with varying substitutions of sitting with standing, physical activity, and sleep within the 24-hour time-use composition.

Methods: Data were from a subsample of 692 participants (age: 58 years; BMI: 27.6 kg/m²; female: 56.2%) in the Australian Diabetes, Obesity and Lifestyle Study (AusDiab 2011/2012) who wore thigh-mounted accelerometers for 7 days. eGFR was assessed using the Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) equation, with enzymatically measured serum creatinine. The 24-hour compositions were derived from the average of 7 days of activPAL device data, with time use categorised into sitting, standing, light-intensity physical activity (LIPA: steps <100/min), moderate-to-vigorous-intensity physical activity (MVPA: steps ≥100/min), and sleep. Multiple linear regression models were used, adjusting for sociodemographic confounders and sleep quality. Furthermore, compositional isotemporal substitution analysis estimated the hypothetical effects of reallocating time use from sitting to standing, LIPA, MVPA and sleep.

Results: Sitting time was the most prevalent behaviour (median [interquartile range-IQR]: 530 [451–605 min/day]),

ABSTRACT AWARD SESSIONS

followed by sleep (497 [460–538]), standing (280 [229–342]), LIPA (90.9 [69.3–113.5]), and MVPA (22.4 [12.2–36.5]). The participants' kidney function was relatively normal, with a median eGFR of 94.3 (IQR: 85.1–101.5) mL/min/1.73m². Higher relative sitting time was associated with lower eGFR (β : -3.32 [CI: -6.59 to -0.05]). Replacing 60 minutes of sitting with standing (1.10 [CI: 0.51 to 1.69] mL/min/1.73m²) or MVPA (1.12 [CI: -0.33 to 2.56]) was associated with higher eGFR; however, only the sitting-to-standing substitution was statistically significant. No significant associations were observed for LIPA (-0.05 [CI: -1.43 to 1.33]) nor sleep (0.29 [CI: -0.47 to 1.05]).

Conclusion: Higher daily sitting time was detrimentally associated with lower kidney function (eGFR). Reducing sitting, potentially by increasing standing, may help preserve kidney health. These findings provide novel insights to inform future sitting-reduction interventions and movement-promotion strategies for kidney health.

AA.03: Awards 3: Motivation and e and mHealth

Room 3, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Two trials aimed to estimate the effects of the components of digital multiple behaviour interventions on alcohol, diet, physical activity, and smoking among university students in Sweden (Buddy), and individuals searching online for help (Coach).

Methods: Two separate studies were conducted in Sweden, both using a double-blind randomised factorial trial design with six two-level factors. The Buddy trial recruited university students proactively through student health care centres and social media at 18 universities. The Coach trial recruited participants through web search and social media who were seeking help to change behaviours. Participants were included if 18 years or older and if they had at least one health behaviour classified as unhealthy. Effects of six components were estimated: screening and feedback; goal-setting and planning; motivation; skills and know how; mindfulness; and self-authored messages. Primary outcomes were weekly consumption of alcohol and frequency of heavy episodic drinking; average daily consumption of fruit and vegetables; weekly consumption of sugary drinks; weekly moderate to vigorous physical activity; and four week point prevalence of smoking. Analyses of outcomes were conducted using multilevel regression models estimated using Bayesian inference. Marginal and pairwise interaction effects of the six intervention components were estimated, with results reported as posterior probabilities of effect and 95% compatibility intervals (Col).

Results: A total of 1704 students (Buddy) and 5419 adults (Coach) were randomised. Evidence for the effectiveness of individual and two-way interactions between components was found across multiple health behaviours. The components screening/feedback, goal-setting/planning, motivation, and skills/know-how demonstrated both individual and interacting improvements. For example, combining screening/feedback and skills/know-how increased fruit and vegetable consumption (0.26 portions/day, Col = 0.05; 0.46, POE 99.4%) at 4 months, while motivation and mindfulness increased physical activity (78.0, Col = 28.3; 128.2, POE = 99.9%) at 2 months.

Conclusion: Findings clarify which components of digital interventions contribute to effectiveness, with heterogeneous effects across behaviours. By identifying how individual intervention components and their interactions influence behaviour change, the studies inform how effective digital interventions can be designed. Findings provide valuable evidence to inform the design of scalable public health interventions addressing key behavioural challenges including unhealthy diet and insufficient physical activity.

AA.04: Awards 4: Children and Families and Early Care

Room 4, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: To characterise pre-schoolers' behavioural profiles based on outdoor play time, screen time, and nighttime sleep duration, and examine associations with health outcomes using a person-centred approach, alongside a variable-centred approach to disentangle individual behaviours' contributions.

Methods: Participants were 991 pre-schoolers (3.94±0.56 years) from Wave 1 (2023-2024) of the Australian Children of the Digital Age (ACODA) survey. Parents reported children's outdoor play time, screen use across 11 devices, and sleep schedules, which were used to derive daily duration for each behaviour. Behavioural, cognitive, and emotional self-regulation (Child Self-regulation and Behaviour Questionnaire subscales) and mental health including positive affect, anxiety, and depression (Patient-Reported Outcomes Measurement Information System; standardised scores) were measured. Complementary analytical approaches were used: latent profile analysis with weighted regression (person-centred) to identify behavioural profiles and associations with developmental outcomes; and multiple regression (variable-centred) to examine associations between individual behaviours and outcomes. All regression models adjusted for sociodemographic covariates.

Results: Three profiles emerged: Group A (10%)—moderate outdoor play (3.40hr/d), higher screen use (6.32 hr/d), shorter sleep (10.12hr/d); Group B (75%)—lower outdoor play (2.57 hr/d), moderate screen use (1.61 hr/d), moderate sleep (10.72 hr/d); Group C (15%)—higher outdoor play (5.52 hr/d), moderate screen use (1.56 hr/d), and longer sleep (10.86 hr/d). Small-to-moderate differences in developmental outcomes were observed across profiles. Compared with Group C, Group A showed lower cognitive self-regulation ($\beta=-0.42$, 95%CI: -0.66, -0.17) yet higher emotional self-regulation ($\beta=0.27$, 95%CI: 0.02, 0.52). Group B exhibited lower cognitive self-regulation ($\beta=-0.16$, 95%CI: -0.30, -0.02) and positive affect ($\beta=-0.16$, 95%CI: -0.31, -0.01) versus Group C. Echoing these patterns, variable-centred analyses revealed small effect-size associations: more outdoor play was associated with better cognitive self-regulation and positive affect but lower emotional self-regulation ($|\beta|=0.07-0.12$). Higher screen use was associated with poorer cognitive self-regulation, paradoxically better emotional self-regulation, and higher anxiety ($|\beta|=0.08-0.12$); Longer sleep was associated with better cognitive self-regulation, greater positive affect, and lower depression ($|\beta|=0.07-0.10$).

Conclusion: Our findings indicate synergistic relationships between integrated daily behaviours and health outcomes in pre-schoolers. Promoting outdoor play and adequate sleep while maintaining moderate-to-low screen use appeared important for cognitive self-regulation and mental health in this age group.

Co-developing Systems-based Interventions to Optimise Nature Play in Scottish Early Childhood Education Settings

O. Traynor¹, A. Johnstone², P. McCrorie³, B. Rigby⁴, M. McQuade⁵, S.A. Simpson¹, A. Martin¹

¹University of Glasgow, Public Health, Glasgow, United Kingdom, ²University of Glasgow, General Practice and Primary Care, Glasgow, United Kingdom, ³University of Exeter, Exeter, United Kingdom, ⁴University of Newcastle, Population Health Sciences, Newcastle, United Kingdom, ⁵University of Glasgow, School of Education, Glasgow, United Kingdom

AA.04: Awards 4: Children and Families and Early Care

Room 4, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Nature play in Early Childhood Education (ECE) settings offers a promising, equity-sensitive strategy to increase physical activity and support holistic child development. This study applied a systems science approach to co-design interventions with stakeholders, aiming to embed nature play more effectively within ECE settings.

Methods: Four co-design workshops were conducted with ECE practitioners (n=17) and managers/providers (n=17).

ABSTRACT AWARD SESSIONS

Using a previously developed systems map of factors influencing nature play implementation in ECE, participants identified change points and designed interventions through scenario-based approaches. Considerations included local authority priorities, implementation mechanisms, and potential unintended consequences. A systems-based programme theory was developed to integrate interventions across the system. Additionally, an online survey of ECE practitioners, informed by the Effort-Reward Imbalance model, examined the impact of providing nature-based experiences on practitioner wellbeing (n=123) and explored perceptions of implementing these interventions in the workplace (n=83).

Results: Ten interventions were co-developed, including: Stay & Play sessions in nature spaces; setting-specific training on creating nature-based experiences; nature space modifications at ECE; child-led risk assessments; positive role modelling behaviour amongst practitioners; outdoor training for modern apprentices; reflective practice templates; staff rota systems for indoor/outdoor time; job descriptions for outdoor provision; and a shared vision for nature play at ECE. These interventions introduced 26 new system factors and 40 connections. Analysis of feedback loops identified 26 loops (23 reinforcing loops and 3 balancing loops) capturing stakeholder-proposed interventions and indicating the potential for systemic change. Survey findings showed that 72% of practitioners agreed or strongly agreed that spending time outdoors at work benefited their wellbeing more than indoors. Additionally, 64% of practitioners viewed setting-specific training and nature space modification interventions as desirable, with 41% and 51% respectively believing these would likely reduce their workload when creating nature play experiences.

Conclusion: This is the first systems approach to intervention co-development to promote nature play in ECE. The systems-based programme theory provided a whole-system intervention plan which may be adopted by other ECE settings who wish to improve their nature play provision to increase child physical activity through playing outdoors in nature and support practitioner wellbeing.

Bridging Generations for Health: A Mixed-methods Process and Effect Evaluation of a Family-based Intergenerational Physical Activity Intervention for Grandparents and Grandchildren

E. Iliano¹, N. Angarita-Osorio², M. Beeckman¹, J. Latomme¹, G. Cardon¹

¹Ghent University, Movement and Sports Sciences, Ghent, Belgium, ²Hospital del Mar Research Institute, Barcelona, Spain

AA.04: Awards 4: Children and Families and Early Care

Room 4, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Many children and older adults do not meet WHO physical activity (PA) guidelines, and most PA interventions target individuals rather than family systems. Intergenerational PA programs may strengthen relationships while integrating PA into daily life. Ages Get Active is a co-created intervention, developed using the Behavior Change Wheel, to stimulate joint physical activity (co-PA) among grandparents and their grandchildren. This study examined (1) its effectiveness on PA, co-PA, and well-being, and (2) its feasibility, acceptability, and sustainability in real-life family contexts.

Methods: A mixed-methods ABAB single-case experimental design was conducted with nine grandparent-grandchild dyads (N = 18). Dyads alternated between baseline (A) and intervention (B) phases, enabling intra-individual comparison over time. Total PA was measured with wrist-worn Axiivies; co-PA was tracked using weekly activity calendars; and general well-being was assessed biweekly with validated questionnaires. Semi-structured interviews with grandparents and parents explored relational experiences and perceived changes. Process evaluation data (attendance logs, feedback forms, interviews, and a focus group) assessed feasibility and acceptability. Quantitative effects were evaluated using TAU-U statistics (negligible: .00–.19; small: .20–.39; moderate: .40–.59; large: .60–.79), correcting for baseline trends. Qualitative data were analyzed using reflexive thematic analysis.

Results: Most grandparents (75%) increased total PA during intervention phases. Co-PA effects ranged from negligible (22%) and small (44%) to moderate (22%) and one large, statistically significant effect (11%, $p = .02$). Children's PA changes were more variable, partly influenced by holidays during baseline. Grandparents reported significantly higher well-being during intervention phases ($p = .006$). Qualitative findings highlighted strengthened emotional closeness and shared enjoyment. Group sessions were valued for motivation and social support, while engagement with home- and community-based activities declined over time due to time constraints, fluctuating motivation, and seasonal/contextual influences. Participants suggested digital rewards and personalized feedback to support sustaining home-based activities.

ABSTRACT AWARD SESSIONS

Conclusion: Ages Get Active shows potential to enhance co-PA, PA levels, well-being, and intergenerational relationships. Sustaining joint activity outside structured sessions remains challenging. Incorporating digital and lighter-touch maintenance strategies may support longer-term integration into family routines. The study contributes to growing evidence for relational, family-based approaches to promoting PA.

Developing Consensus for a Responsive Feeding Approach in Early Care and Education Settings

J.E. Campbell^{1,2}, M.D. Rossiter³, J.-L.D. McIsaac^{1,4,5}

¹Mount Saint Vincent University, Early Childhood Collaborative Research Centre, Halifax, Canada, ²Dalhousie University, School of Health and Human Performance, Halifax, Canada, ³University of Prince Edward Island, Applied Health Sciences, Charlottetown, Canada, ⁴Mount Saint Vincent University, Faculty of Education, Halifax, Canada, ⁵Mount Saint Vincent University, Department of Child and Youth Study, Halifax, Canada

AA.04: Awards 4: Children and Families and Early Care

Room 4, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Early care and education (ECE) programs play a critical role in shaping children's relationships with food through responsive feeding environments. Responsive feeding, characterized by recognizing and appropriately responding to children's hunger and fullness cues, promotes self-regulation and lifelong healthy eating behaviours. Despite growing interest, there remains limited consensus defining the core behaviours that constitute a responsive feeding environment in ECE settings. Building on previous intervention work from the *CELEBRATE Feeding* (Coaching in Early Learning Environments to Build a Responsive Approach To Eating and Feeding) feasibility study, the current study aimed to identify and confirm the critical behaviours that facilitate a responsive feeding environment in ECE programs through an expert consensus.

Methods: A three-round modified online Delphi study was conducted with international experts from Canada, the United States, Australia, and the United Kingdom in early learning, nutrition, and responsive feeding to refine and validate the *CELEBRATE Feeding Approach* (Rossiter et al. 2024), a framework of responsive feeding behaviours in ECE. Across three iterative survey rounds, participants rated each behaviour on six APEASE criteria (affordability, practicality, acceptability, effectiveness, side-effects, and equity) using a 7-point scale, and provided qualitative feedback. Consensus was defined as a standard deviation ≤ 1.0 for each criterion.

Results: A total of 33 participants completed Round 1, 31 completed Round 2, and 27 completed Round 3. Panelists reached consensus on most core responsive feeding behaviours, particularly those emphasizing children's autonomy, self-regulation, and educator responsiveness. Behaviours such as "supporting children to decide what and how much to eat," "establishing consistent and responsive routines," and "limiting pressure to eat" achieved the highest agreement across domains of effectiveness and equity ($M > 6.5$, $SD < 0.8$). Lower consensus was observed for context-dependent behaviours, such as "facilitating play related to food" and "discussing cultural food practices," reflecting more variability in their contribution to responsive feeding.

Conclusion: The Delphi process achieved strong consensus on key behaviours underpinning responsive feeding in ECE contexts, offering a strong foundation for the *CELEBRATE Feeding Approach*. Findings provide clarity for implementation to support educators and policymakers, contributing to responsive food environments for young children.

AA.04: Awards 4: Children and Families and Early Care

Room 4, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Skeletal muscle health (strength, thickness, quality) in adolescence is closely linked to metabolic function. Daily movement behaviours, including sleep, sedentary time, light physical activity (LPA), and moderate-to-vigorous physical activity (MVPA), together form the 24-hour movement behaviours (24h-MB) and may be associated with muscle health. However, limited evidence exists. Therefore, this study examined the longitudinal association of childhood 24h-MB with muscle strength, thickness, and intramuscular adipose tissue (IMAT) in early adolescence in Singapore.

Methods: In the Growing Up in Singapore Towards healthy Outcomes (GUSTO) birth cohort study, movement behaviours were assessed using ActiGraph (GT3x) accelerometry at ages 5.5, 8, 10, and 12 years. A subset of participants had comprehensive muscle health assessments at 13.5 years (n=212); muscle strength (quadriceps and biceps) was assessed using Biodex dynamometer, and muscle thickness [rectus femoris, vastus lateralis] and IMAT were assessed using Ultrasound Imaging. Compositional multivariable linear regression and isothermal reallocation were used to examine associations between each 24h-MB composition and muscle outcomes, adjusting for child sex, ethnicity, maternal age, maternal education and children's BMI at age 13.5 years.

Results: Children with at least one time point of accelerometer data and muscle health information were included in the analyses, n=198 (49.5% girls). Our preliminary analysis showed that higher MVPA, relative to the remainder of the 24h-MB composition, was associated with a more favourable muscle profile. This included greater muscle strength [thigh peak torque at 240°/s: $\beta = 13.05$, 95% CI: (6.95, 19.14) Nm], larger muscle thickness [rectus femoris: 0.93 (0.03, 1.83) mm; vastus lateralis: 0.98 (-0.19, 2.16) mm], and lower IMAT [vastus lateralis: $\beta = -1.44$ (-2.61, -0.26) %; rectus femoris: -0.92 (-2.18, 0.34) %]. Overall, reallocations of time favouring MVPA were associated with healthier muscle profiles, whereas LPA was linked to less favourable muscle-profiles. Sleep and SB were not associated with muscle health indicators.

Conclusion: Our findings suggest that the reallocations of time between various movement behaviours during childhood plays an important role in shaping muscle health during early adolescence. These findings suggest that increasing opportunities for MVPA within the day may help support healthy muscle development and metabolic resilience.

AA.05: Awards 5: Implementation and Systems Science

Room 5, May 27, 2026, 3:00 PM - 4:00 PM

ABSTRACT AWARD SESSIONS

Purpose: Sustaining effective public health programs is crucial to reach population health impacts such as obesity reduction and to make efficient use of resources invested in initial adoption. However, it remains a persistent challenge with review evidence showing that less than a quarter of public health programs continue after two years. We conducted a qualitative study with policy makers and practitioners across Australia to explore: (A) the key challenges to sustainment and (B) how they respond to these challenges.

Methods: We conducted a pragmatic exploratory qualitative study with a purposeful sample of Australian policy makers (based in government health departments or statutory body) and practitioners (those delivering government/donor funded health programs). Consenting participants participated in one-on-one or group interviews conducted online and recorded. Data were transcribed, checked for accuracy and analysed in NVivo. Two researchers applied Framework Analysis, inductively coding the data set using a codebook based on the research aims (A: Challenges B: Responses). Final themes were collaboratively developed with a third researcher. As a final step, each theme for 'Response' was mapped to a corresponding 'Challenge' to explore how challenges were being addressed in real-world conditions, and where gaps remained.

Results: A total of 35 individuals participated (23 policy makers and 12 practitioners), representing every state and territory in Australia. Participants worked across diverse health areas, e.g., nutrition policies, maternal health, water safety, community walking programs, and child physical activity. Aim A: Four broad themes (encompassing 13 subthemes) were identified as challenges for sustaining programs: Funding and resources, Political landscape, Demonstrating impact, and Implementation context. Aim B: Five broad themes (encompassing 20 subthemes) were identified as responses: Adapt, Harness implementing context, Evaluate and monitor, Navigate the decision point, and Early intentional efforts. Challenge-response mapping found Funding remains a persistent challenge with few responses.

Conclusion: Policy makers and practitioners must respond to complex challenges to sustain health programs. Future research needs to focus on testing what strategies work to sustain programs under dynamic conditions. Such evidence could guide decision makers in program selection and resource allocation to give the best chance of effectively sustaining programs and creating long-lasting impact on public health.

Implementation and Systems Impact of a Systems-based Health Promotion Programme at Danish Vocational Schools: Results after 2-years Follow-up

C. Heinze^{1,2}, H.R. Johnsen¹, R.F. Krølner², C.D. Klinker¹

¹Steno Diabetes Center Copenhagen, Department of Prevention, Health Promotion and Community Care, Herlev, Denmark, ²University of Southern Denmark, National Institute of Public Health, Copenhagen, Denmark

AA.05: Awards 5: Implementation and Systems Science
Room 5, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Vocational schools represent important settings for health promotion among young people from lower socioeconomic backgrounds, who are at increased risk of engaging in health-compromising behaviours. However, health promotion interventions are rarely sustained in school settings. Systems thinking has been proposed as a promising approach to health promotion but remains unexplored in vocational school settings. The aim of this study was to examine the implementation and systems impact of a systems approach to health promotion in Danish vocational schools, and to elucidate the overarching pathways through which such impacts may emerge in schools.

Methods: This longitudinal qualitative study was conducted as a part of the Data Health programme, a systems-based initiative implemented across eight Danish vocational schools and four municipalities. Quarterly interviews (n = 59) were analysed using Ripple Effect Mapping to visualise evolving actions and impacts over a two-year period and to identify enablers and barriers to systems impact. Systems impact was analysed in accordance with "the six conditions of systems change", providing a conceptual framework for interpreting patterns of transformation within and across the schools. A cross-case analysis was then conducted to identify key pathways enabling systems impact.

Results: At two-year follow-up, 42 actions had been implemented, and systems impact (structural, relational, and/or transformative change) was observed at six out of eight schools. Two reinforcing systems impact pathways emerged: (1) internally driven change via committed staff and distributed leadership, and (2) externally supported change through collaboration with community actors. Key enablers included dedicated change agents, financial resources, student participation, external networks and backbone support. Barriers included staff turnover, time constraints, and fluctuating student groups due to practical training outside the schools.

Conclusion: A systems approach to health promotion, as developed through the Data Health Programme, holds

ABSTRACT AWARD SESSIONS

considerable potential to create impactful and sustainable systems changes in Danish vocational schools. Moreover, by identifying key pathways across sites, the study enabled us to go beyond isolated case descriptions and begin developing more generalisable theories of change for a systems approach to health promotion in schools.

AA.05: Awards 5: Implementation and Systems Science
Room 5, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Scaling up effective school-based nutrition programs is crucial to achieve population-level health impact. Developing evidence-based scale-up strategies (SUS) may achieve increased uptake of such programs. However, it is important to understand acceptability of SUS for stakeholders since this may influence SUS effectiveness.

Methods: We conducted a multi-method process evaluation following four parallel-randomised controlled trials in four Australian state jurisdictions. These trials assessed the effectiveness of an evidence-based scale-up intervention to increase adoption of an effective primary school-based healthy lunchbox program ('SWAP IT'). The scale-up intervention included six, principal-targeted SUS delivered by preventive health agencies in each jurisdiction (implementers). Online surveys assessed intervention group principals' recall and acceptability of receiving each SUS. Online surveys assessed implementers' perspectives on the acceptability of developing, tailoring, and implementing each SUS, how this aligned with their usual way of working, and likelihood of using these SUS for other scale-up activities. We conducted semi-structured interviews and focus groups with implementers in each jurisdiction to further assess acceptability of SUS. We analysed survey data using descriptive statistics and qualitative data using deductive framework analysis to identify themes.

Results: Overall, 104 (32%) intervention school principals provided acceptability data. Sixty (58%) recalled receiving at least one SUS. On average, 92% (range: 70-100%) of principals rated the SUS as highly acceptable/acceptable. Forty-four implementers provided survey acceptability data. All implementers rated the process of developing and tailoring the SUS as "highly acceptable" and would use the process again. SUS implementation was rated highly acceptable/acceptable by 85% (range: 80-93%), 77% (range: 49-88%) indicated alignment with their usual way of working, and 77% (range: 56-88%) indicated they would use the SUS for future scale-up activities. Implementers identified factors that influenced acceptability of SUS ('alignment with usual practice', 'ease to implement', and 'effectiveness'). SUS deemed less acceptable to implementers required higher intensity to deliver or were less aligned with their usual way of working.

Conclusion: Overall, the SUS were highly acceptable to school principals and implementers within four Australian jurisdictions. Minimising SUS delivery intensity and adapting to jurisdictional organisational ways of working may further improve acceptability.

Using Systems Archetypes in Public Health: A Scoping Review Exploring their Potential for Bridging the Gap between System Structure and Leverage Points

L. Crielaard¹, L. Hagenaars¹, J. O'Mara¹, M. Nicolaou¹, W. Waterlander¹, K. Stronks¹

¹Amsterdam UMC, Public and Occupational Health, Amsterdam, Netherlands

AA.05: Awards 5: Implementation and Systems Science

Purpose: In systems approaches in public health, it remains challenging to progress from understanding the current

ABSTRACT AWARD SESSIONS

system structure producing undesired health outcomes, to identifying how this structure – and the resulting system behaviour – could be changed. Systems archetypes, originating from system dynamics (SD), represent combinations of system structure and system behaviour that can be ‘diagnosed’ across different systems (e.g. Tragedy of the Commons). Each suggests potential ‘treatments’, referred to as leverage points, to improve system outcomes (e.g. turning future collective losses into immediate individual costs). While promising, archetypes have also been criticised for encouraging premature conclusions, where researchers could start perceiving archetypes everywhere, without supporting evidence that an archetype might be at play in a certain system.

Methods: We reviewed foundational methodological SD literature (19 papers/books) to assess how archetypes could bridge the gap between system structure and leverage points and to identify key methodological benefits and pitfalls. We then reviewed 29 public health studies applying archetypes to examine how these applications align with the methodological literature.

Results: The SD literature suggests that archetypes can help connect understanding of system structure with insight into (1) leverage points and (2) unintended consequences of interventions, by making the link with system behaviour. Both purposes are reflected in the public health applications. Two main methodological benefits and pitfalls emerged. First, archetypes can provide a structured and reproducible approach for exploring leverage points, but should be used as hypothesis-generating tools requiring further testing. All 29 public health studies acknowledged this hypothesis-generating function. Second, archetypes can support transparent reasoning and integration of empirical data, but omitting evidence and testing risks unsubstantiated conclusions. Only six public health studies used graphs over time, reflecting system behaviour, to support archetype identification, and only three cross-checked hypotheses about system structure and system behaviour with existing empirical data.

Conclusion: When applied as hypothesis-generating tools for diagnosing system behaviour and exploring leverage points, archetypes could help bridge the gap between understanding system structure and developing change strategies in public health. Greater integration of empirical data, evidence and testing would enhance the rigour of archetype-based approaches to understanding and transforming systems in public health.

A Matter of Luck? Determinants and Strategies for Successful Scale-up of Health Interventions in the Netherlands

R. Smit¹, G. Muru¹, K. Bessems², V. Busch³, D. van Dale⁴, S. Gerards², S. van Twillert⁵, S. Bukman⁶, F. van Nassau¹

⁶Kenniscentrum Sport en Bewegen, Utrecht, Netherlands

AA.05: Awards 5: Implementation and Systems Science

Room 5, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Scaling evidence-based health interventions to widespread implementation can be challenging, and failure to do so can significantly limit their population-wide impact. While various tools exist to support scale-up processes and some interventions are known to have achieved successful scale-up, limited knowledge is available on what drives successful scale-up in practice. This provides a window of opportunity to learn from those experiences to inform future scale-up processes. This study aimed to identify key determinants and scale-up strategies that contributed to successful scale-up of health promotion interventions in the Netherlands.

Methods: A mixed-methods approach was used, starting with 21 semi-structured interviews with intervention owners (i.e. the individual or team taking the responsible for several aspects related to implementation and scale-up) involved in the scale-up of 23 health interventions (implemented across various health behaviours and different settings in the Netherlands), followed by a survey completed by 117 interventions registered in national intervention databases to assess scale-up experiences. Guided by the WHO ExpandNet framework, insights from interview data were used to identify determinants and strategies, which informed the survey to validate and refine insights about these aspects of scaling.

Results: Key determinants for successful scale-up included: committed intervention ownership, funding, right timing, perceived value, and sufficient time for scale-up. Scaling strategies involved lobbying, PR and communication activities to engage policymakers, stakeholders, implementers and target groups. Securing funding for development, research, and overhead costs was frequently emphasized. Organizational strategies such as adapting to local or national demand and continuous development, as well as monitoring and evaluation for intervention improvement and database recognition, were commonly employed.

ABSTRACT AWARD SESSIONS

Conclusion: Scaling up interventions is not a matter of luck; it requires sustained effort from a driving force, often the intervention owner/team. Scaling strategies are different from implementation strategies and underexplored in the literature. There is no one-size-fits-all strategy; success depends on context, timing, funding, and added value. Sustainable scaling requires coordinated efforts from local, regional, and national levels to reduce reliance on individual champions and ensure long-term success.

AA.05: Awards 5: Implementation and Systems Science
Room 5, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Gain insight into promising new approaches to increase physical activity in young children using a validated simulation model based on data from a randomized control trial.

Methods: We used the ACTIVE Agent-based Model (ABM) which is grounded in high-quality data from the GROW RCT. GROW was a community-based obesity prevention intervention with 610 parent-child pairs. Accelerometers were used to measure physical activity. The ABM model allows us to make the RCT evidence go further by uncovering mechanisms driving results and evaluating counterfactual scenarios representing potential novel interventions that go beyond those studied originally.

Results: Using the simulation model, we identified promising approaches with projected substantial positive improvement in MVPA (measured as mean daily MVPA). The biggest overall population effect we found came from combining built environment investments with creation of new gathering places, which increased MVPA by about 48 minutes per day over baseline. Targeting this intervention at disadvantaged (lowest quality built environment) neighborhoods can close persistent MVPA gaps.

We also found combinations of several individually effective interventions are fully additive. These included:

- Increased parental support: increased MVPA by about 14 minutes per day.
- Built environment investments: increased MVPA by about 14 minutes per day, while reducing MVPA differences between boys and girls by about 6 minutes.
- Broad cultural changes representing shifts in social norms around PA: increased MVPA by 26 minutes per day.
- Creating gathering places: increased MVPA by about 33 minutes per day.

For each of these intervention approaches, we link our results to recent evidence from program implementation and evaluation to ensure meaningful, actionable interpretation of findings.

We also investigated a wide range of other commonly proposed policies or interventions such as school-based, afterschool, or summer programs which had much less projected impact.

Conclusion: Our ABM sheds light on the system of influences driving childhood PA and identified interventions that, alone or in combination, can increase overall PA or reduce persistent gaps. With data collection guided by the model's requisite inputs, this ABM can be applied to other community settings, thus acting as a tool to prospectively guide the design and implementation of context-specific, high-potential interventions.

AA.06: Awards 6: Ageing and Young Adults

Room 6, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Promoting physical exercise in natural environments has proven to be a promising strategy for improving physical function and mental health in older adults. This study evaluated the effectiveness of a green exercise program in improving balance among institutionalized older adults.

Methods: Intervention study with 54 subjects, of which 31 (57.4%) were female and 23 (42.6%) were male, aged 73.0 ± 8.38 years, divided into Intervention Group (IG) and Control Group (CG), consisted of two intervention moments and one moment of observation of adherence (control of interest in continuing in the PAFV), each moment lasting 7 weeks, the evaluations were carried out at four different moments, namely (M1) Initial evaluation before the intervention, (M2) after the first moment of intervention, (M3) after the second moment of intervention and (M4) after the adherence period, the intervention included multicomponent exercises, muscular strength and flexibility, three times a week, the moments were evaluated using the Short Physical Performance Battery (SPPB). The data were analyzed using descriptive statistics and repeated measures ANOVA with Sidak's post hoc test, observing the 95% CI. The study was approved by the Institutional Committee of Bioethics in Health of the Faculty of Medicine of UEM/Hospital Central de Maputo (Registration: CIBS FM&HCM/41/2024).

Results: A positive variation in the mean balance values of the IG throughout the intervention period, showing at all times of the evaluation significant statistical differences compared to the CG ($p < 0.001$), whose means assumed stability (M1: $F=11.716$, $p=0.01$; M2: $F=16.511$, $p=0.00$; M3: $F=9.823$, $p=0.03$; M4: $F=11.006$, $p=0.02$), except for the intragroup interaction, which did not present significant statistical differences.

Conclusion: The results suggest that PAFV is likely to model balance indicators, prevent falls, improve functional capacity and quality of life of institutionalized elderly people.

Co-designing a WhatsApp-based Healthy Eating Intervention with Young Adults in Jamaica and the United Kingdom

S. Parks¹, J. Renzella², A. Kaur², F. Dillman Carpentier³, S. Soares-Wynter⁴, C. Albury², M. Rayner¹, P. Scarborough²

¹University of Oxford, Nuffield Department of Population Health, Oxford, United Kingdom, ²University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, ³University of North Carolina at Chapel Hill, Hussman School of Journalism and Media, Chapel Hill, North Carolina, United States, ⁴University of the West Indies, Caribbean Institute for Health Research, Kingston, Jamaica

AA.06: Awards 6: Ageing and Young Adults

Room 6, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Young adults are influenced by food-related content on digital platforms, yet few digital healthy eating interventions are co-designed with them or tackle food affordability. To address this gap, we co-designed a theory-driven digital intervention to be tested starting in January 2026. This co-designed intervention is innovative in combining digital engagement with affordability support to promote healthy eating among young adults (18-25) in Jamaica and the United Kingdom.

Methods: Our intervention was informed by (1) ten youth-generated recommendations from a mixed-methods systematic review on digital food communication, (2) consultations with Young People Advisory Groups (YPAGs) in Jamaica and the UK, and (3) qualitative research in Jamaica and the UK exploring young adults' experiences with food-related videos and their proposed digital solutions to support healthy eating in their population. Insights informed a COM-B diagnosis, mapping to Behaviour Change Wheel intervention functions, and specific Behaviour

ABSTRACT AWARD SESSIONS

Change Techniques (BCT) mapped to the validated BCT Taxonomy v1. Two YPAG co-design workshops were held to review the intervention concept and decide on message tone, format, and content.

Results: Young adults prioritised realistic meal ideas, cost-saving tips, non-judgmental messaging, relatable influencers, and appropriate intervention group sizes. The co-design process yielded a WhatsApp intervention that will deliver daily messages (including recipes, short-form videos, and simple healthy food swaps), peer support, and affordability support using weekly supermarket vouchers. The 8-week pilot and feasibility trial will have 75 participants in each country, randomised (2:2:1) to: (1) WhatsApp group only; (2) WhatsApp group + weekly supermarket voucher; or (3) control (printed materials). Primary outcomes include the feasibility of research procedures and intervention components. The secondary outcome will assess changes in self-reported diet quality using the Mini-Eating Assessment Tool. Quantitative data will be analysed descriptively, and qualitative data will be analysed using thematic analysis. The APPEASE criteria will be used to assess the feasibility and scalability of the intervention.

Conclusion: The participatory development of this intervention demonstrates the value of youth engagement in creating relevant, theory-driven, cross-national nutrition interventions. The process enhanced the potential for social validity, which highlights how co-design approaches can strengthen the development of dietary interventions.

AA.06: Awards 6: Ageing and Young Adults

Room 6, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: To examine the dose-response association of active commuting to/from work with all-cause mortality and incidence of cardiovascular disease (CVD), and secondly, to explore whether these associations differ across environments with varying levels of air pollution.

Methods: A total of 203,113 employed individuals from the UK Biobank who provided complete information on transport mode, commuting weekly frequency, and distance to work were included. The dose of active commuting was calculated as weekly energy expenditure in METs. Outcomes were defined algorithmically by UK Biobank and included all-cause mortality and incident CVD. Splines were used to assess the dose-response associations between active commuting with each outcome, adjusting for sociodemographic, lifestyle, health-related, and environmental covariates, including air pollutants.

Results: An inverse dose-response association was observed between METs and all-cause mortality, with risk reductions starting around 1,600 METs-min/week and reaching a minimum at 5,000 METs-min/week (HR: 0.37; 95% CI: 0.20–0.71). For CVD, risk declined progressively, with statistically significant associations from approximately 1,500 METs-min/week and a lowest risk at 5,000 METs-min/week (HR: 0.45; 95% CI: 0.28–0.74). Sensitivity analyses excluding the first two years of follow-up yielded consistent results across all outcomes. Additional analyses stratifying by air pollutant levels (PM_{2.5}, PM₁₀, and NO₂) did not materially alter the associations.

Conclusion: There is a dose-response association between active commuting to and from work and long-term health benefits for all-cause mortality, cardiovascular disease. These associations appear to be robust and independent of air pollution levels. Future research should aim to capture more precise and objective measures of active commuting dose, such as through the integration of accelerometry and GPS data.

AA.06-4

Promoting Healthy and Sustainable Eating Behavior in Higher Education Students: A Multicomponent Co-created Intervention

T. Deliëns¹, M. Vanhove¹, Y. Verhavert¹, B. Deforche², M. Verloigne², W. Van Lippevelde³

¹Vrije Universiteit Brussel, Movement and Sport Sciences, Brussels, Belgium, ²Ghent University, Public Health and Primary Care, Ghent, Belgium, ³Ghent University, Marketing, Innovation, and Organization, Ghent, Belgium

AA.06: Awards 6: Ageing and Young Adults

Room 6, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: This study performed an effect- and process evaluation of a co-created multicomponent intervention promoting healthy and sustainable eating behavior among higher education students.

Methods: A quasi-experimental design was used to investigate intervention effectiveness. One university and one university college participated in the study, each delivering one intervention and one control campus. The intervention campuses received three components: a social media campaign, canteen nudges, and interactive workshops focusing on healthy and sustainable eating behavior. The control campuses did not receive any intervention. Students from intervention and control campuses completed an online questionnaire pre and post the eight-week intervention. Outcomes were eating behavior and its socio-cognitive determinants. Furthermore, a comprehensive process evaluation was performed using questionnaires, interviews and focus groups. At this time, only data on eating behavior have been analyzed but results on its determinants as well as on the process evaluation will be presented. Generalized linear mixed models assessed differences in daily intake of fruit, vegetables, water, whole grains, red meat, legumes, dairy products, and discretionary foods between intervention and control campuses over time. Analyses were performed in R Studio with p -values <0.05 considered statistically significant.

Results: A total of 383 students (mean age 20.1 ± 1.7 years; 76% women) were included. No significant differences in change over time were found between intervention and control campuses: fruit (intervention: +0.0195; control: +0.0167, $p_{\text{interaction}}=0.899$), vegetables (+0.0379; +0.0181, $p_{\text{interaction}}=0.493$), water (+0.0911; +0.0011, $p_{\text{interaction}}=0.233$), whole grains (-0.0880; -0.0764, $p_{\text{interaction}}=0.859$), red meat (-0.0246; -0.0168, $p_{\text{interaction}}=0.706$), legumes (-0.0015; -0.0004, $p_{\text{interaction}}=0.309$), dairy products (-0.0203; -0.0195, $p_{\text{interaction}}=0.809$), and discretionary foods (-0.0249; -0.0293, $p_{\text{interaction}}=0.790$).

Conclusion: These findings suggest that the co-created intervention did not lead to measurable changes in eating behavior. However, given that the intervention also targeted socio-cognitive determinants of eating behavior, further analyses and extensive process evaluation will yield more insights into the lack of effects.

AA.06-5

Major Depressive Disorder and Social Frailty among Indian Older Adults: Evidence from LASI Wave-1

A.S. Rajpoot¹, D.W. Bansod¹

¹International Institute for Population Sciences, Public Health and Mortality Studies, Mumbai, India

AA.06: Awards 6: Ageing and Young Adults

Room 6, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Older adults are increasingly recognized for their vulnerabilities, as aging often brings declining health, functional limitations, and weakening social networks. Social frailty, characterized by reduced resources, support, and participation, undermines social capital that is vital for well-being in later life. In India, rapid demographic transition and changing family structures further intensify these challenges. Against this backdrop, major depressive disorder (MDD) has emerged as a critical public health concern, projected to become the leading cause of disease burden by 2030. This study aims to examine the relationship between social frailty and MDD among older adults in India.

Methods: Using data from the Longitudinal Ageing Study in India (LASI) Wave-1 (2017-2018) we considered a total of 66606 older adults aged 45 and above. Major Depressive Disorder (MDD) is defined using DSM-5 criteria and measured with the CIDI-SF. Social frailty was measured using the Social Frailty Index (SFI) and categorized into five groups (Very Low to Very High). Several socio-demographic and health-related factors were considered in the study. We applied Bivariate analysis, logistic regression to evaluate the associations with MDD.

Results: MDD prevalence declined sharply with stronger social resources: 8.96% in the Very Low SFI group compared

ABSTRACT AWARD SESSIONS

to 1.35% in the Very High group. Regression findings confirmed that female sex, marital disruption, chronic disease, disability, poor self-rated health, and sleep disturbances were associated with greater risk of MDD. Age, current marital status, region, religion, MPCE quintile, number of chronic conditions, number of Activities of Daily Living (ADL), and Instrumental Activities of Daily Living (IADL), involvement in physical activity, involvement in yoga/meditation, number of social networks, participation in social activities, and involvement in leisure activities like reading books, watching TV, using computer were found to be significantly associated with MDD.

Conclusion: Not being in a marital union, having more than two chronic conditions, more than two ADL and IADL difficulties, being physically inactive, non-involvement in Yoga, and small social network are associated with higher MDD. social frailty is inversely associated with MDD among older Indians. Addressing social frailty through community engagement and supportive networks should be prioritized as part of healthy aging strategies in India.

Digital Marketing Techniques and Food Choice Drivers: Real-time Insights into Young People's Online Food Delivery Service Use in Australia

A. Gupta¹, C. Vargas¹, K. Backholer¹, K. Huggins¹, A. Peeters^{2,1}

¹Deakin University, Institute for Health Transformation, Melbourne, Australia, ²Victorian Health Promotion Foundation, Melbourne, Australia

AA.06: Awards 6: Ageing and Young Adults

Room 6, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: The Online Food Delivery (OFD) sector has experienced unprecedented growth since the pandemic began. In Australia with a market size of \$1.3bn in 2023, over three billion consumers used OFD services in 2024. Very little is known on the public health impact of OFD service use and what actions are needed to ensure that OFD services offer healthy foods. The aim of this study was to describe young people's exposure and engagement with digital marketing techniques and how this influences food purchasing decisions in real-time.

Methods: Using a screen capture method followed by in-depth semi-structured interviews (n=50), we gathered data on young Victorians (aged 15-35 years) exposure to digital marketing techniques and factors influencing their food choice decisions on OFD services, in real-time. Screen recordings were analysed using content analysis, guided by the marketing mix framework. Qualitative data were deductively coded, guided by the socio-ecological model, using thematic analysis.

Results: Analysis of screen recordings of food purchases on OFD services revealed that over 90% of young consumers were exposed to a wide range of discretionary foods (e.g. pizza, chips) promoted through diverse digital marketing techniques such as price discounts, promotion on food items, gamification and personalised strategies (e.g., "only for you"). Similar factors driving food choices on OFDS were observed for both the age groups, guided by the socio-ecological model: individual motivations to seek comfort food, convenience (time- and cost-saving), social and sensory influence, to platform-level factors such as price promotions on unhealthy food, quick delivery and appealing food images. Notably, consumers aged 15-24 years had limited concern and knowledge about the health impacts while those aged 25-35 years of acknowledge health considerations but did not prioritise health when purchasing food using OFD services.

Conclusion: Multiple factors influence young consumers' food purchasing decisions on OFD services- ranging from individual and social circumstances to digital marketing techniques. Our research underscores an urgent need for coordinated policy action to transform OFD services into health-promoting environments, empowering young people to make informed and healthier food choices.

AA.07: Awards 7: Policies and Environments and Participatory research

Room 7, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Improving higher education students' diet is a public health priority, yet interventions often fail to address the structural barriers students face, particularly in socioeconomically disadvantaged settings. This study aimed to explore whether student citizens' assemblies may represent a valuable approach to co-creating interventions intended to support healthier, climate-friendly and economically affordable diets among students.

Methods: This participatory research took place at a French university (Sorbonne Paris Nord) located in socioeconomically disadvantaged suburbs of Paris. A student citizens' assembly was conducted with the aim to co-create concrete proposals that would enhance students' access to sustainable diets and physical activity. The assembly involved 27 students randomly selected among a pool of volunteers. Over three days in November 2024, students received awareness-raising and training, deliberated among themselves then with institutional and local stakeholders, and formulated proposals. For each proposal, students were asked to rate anonymously their approval on a 10-point scale. Proposals related to diet (i.e. not physical activity) were analysed using two complementary frameworks: the DONE framework classifying determinants of diet (individual, interpersonal, food environment and policy) and the FAO dimensions of sustainable diets (health, environmental, socioeconomic, cultural).

Results: Overall, 31 proposals were formulated, of which 77% targeted food environment and policy determinants of diet (e.g. institutional regulations, university policies, food assistance solutions, food affordability, availability and labelling). Other proposals referred to individual (19%) and interpersonal determinants (3%). In addition, 39%, 29%, 23% and 10% proposals addressed the health, socio-economic, environmental and cultural dimensions, respectively. Mean approval ratings (SD) from the students ranged from 6.7 (4.0) to 9.7 (0.9), with a mean (SD) value for all proposals of 8.6 (0.7). Proposals addressing the socio-economic dimension received the highest approval ratings (mean [SD] 9.0 [0.6], vs 8.4 [0.6], 8.4 [0.8] and 7.9 [0.4] for the health, environmental and cultural dimensions, respectively).

Conclusion: The predominance of environmental and policy measures targeting economic access to food highlights the importance of co-creation and its value to align interventions with participants' needs and expectations. One major challenge that warrants further investigation is the capacity of stakeholders to implement such proposals, and to evaluate their effectiveness.

AA.07-3

Sustaining Healthy Food Retail: Do Australian and New Zealand Government Policies Consider Long-term Change?

B. Backman¹, M.R Blake¹, C. Zorbas¹, A. Chung², S. Schultz¹, V. Brown³, P. Mäki⁴, S. Yoong¹

¹Deakin University, Institute for Health Transformation, Global Centre for Preventive Health and Nutrition, Geelong, Australia, ²Monash University, Department of Nutrition, Dietetics and Food, Melbourne, Australia, ³Deakin University, Institute for Health Transformation, Deakin Health Economics (DHE), Geelong, Australia, ⁴Finnish Institute of Health and Welfare (THL), Department of Public Health, Helsinki, Finland

AA.07: Awards 7: Policies and Environments and Participatory research

Room 7, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Healthy food retail policies are government instruments designed to encourage healthier food and drink purchases by regulating aspects of retail settings that influence consumer purchasing behaviour. It remains unclear how these policies assign responsibility for sustaining healthy food retail practices or whether they reflect evidence-based strategies for long-term sustainment. This study applies implementation science theory to policy analysis to address a critical knowledge gap by exploring how national and jurisdictional policies in Australia and New Zealand conceptualise and support the long-term sustainment of health-promoting food retail practices, the strategies they include to enable long-term change, and where gaps remain between theory and practice.

Methods: A qualitative, interpretive policy analysis was conducted. A purposive sample of government „policy cases“ was compiled, each comprising a main policy document and accompanying materials (e.g., implementation guidelines) published or updated between 2014 and 2025. These were identified using documents from the publicly available Healthy Food Environment Policy Index assessments, followed by systematic searches of government websites. Policies were analysed using a multi-theory coding framework informed by problematisation theory, the Integrated Sustainability Framework (outlining factors influencing sustainment), and sustainment-explicit Expert

ABSTRACT AWARD SESSIONS

Recommendations for Implementing Change strategies. Thematic analysis was used to identify how sustainment was represented in policies.

Results: Thirty-three policy cases were included. Most policies were designed for public settings, with school and healthcare food outlets being the most common. Four key themes were constructed: (1) explicitly (directly) framing sustainment as a formal, complex process; (2) implicitly (indirectly) problematising sustainment through 'sustainment strategies' (e.g., compliance monitoring); (3) acknowledging top-down institutional responsibility for sustainment; and (4) underplaying retailer responsibilities and sustainment challenges.

Conclusion: Australia and New Zealand's healthy food retail policies rely largely on top-down strategies, placing responsibility for sustained change on public institutions (e.g. healthcare organisations, schools). Limited attention is given to broader systemic or contextual factors, such as the profitability of healthy options and the capacity of retailers or public institutions to maintain changes. To better support healthier consumer food and drink purchases in the long term, policies should adopt more comprehensive approaches that promote flexibility, capacity-building, and shared responsibility across key actors.

Co-Designing a Multi-component Intervention to Promote Healthy Diet and Physical Activity among Adolescents in Urban Ghana and Kenya: The Generation H Study

G. Amevinya¹, R. Pradeilles¹, E. Landais¹, A. Laar², P. Aovare², J. Kinuthia³, P. Otieno³, E. Beune⁴, S. Vandevijvere⁵, L. Sherar⁶, P. Griffiths⁶, C. Agyemang^{4,7}, M. Holdsworth¹

AA.07: Awards 7: Policies and Environments and Participatory research
Room 7, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Adolescents in urban Sub-Saharan Africa (SSA) are increasingly likely to have unhealthy diets and low levels of physical activity. Interventions to address these are often designed in non SSA populations and thus fail to account for adolescents lived experiences and local context. We aimed to co-design a theory- and evidence- informed multi-component intervention to promote healthy diets and physical activity among adolescents in urban Ghana and Kenya.

Methods: A multi-stage co-design participatory process engaged key stakeholders (adolescents, parents, teachers, community leaders, health and education professionals, and policy actors) in urban Ghana and Kenya. Guided by the UK Medical Research Council framework for developing and evaluating complex interventions, the process combined formative research and interactive co-design activities: (1) Engagement with 362 stakeholders through focus groups or in-depth interviews to understand underlying influencing factors of the unhealthy behaviours using the COM-B model and a socio-ecological framework ; (2) Evidence synthesis (realist) to formulate intervention programme theory from 93 articles that informed intervention components; (3) Prioritisation of intervention target behaviours; (4) Intervention development group using four co-design workshops (per country) to brainstorm design ideas for the identified core intervention components in step 2; and (5) Mapping 'Intervention function' and 'behaviour change techniques' from the Behaviour Change Wheel to the co-designed intervention.

Results: Intervention programme theory comprised three core components (education provision, increasing availability of fruit, vegetables and water, and enabling physical activity equipment use) and three supporting components (leveraging peer influence, engaging parents and community leaders, and incorporating cultural relevance). Specific target behaviours selected by stakeholders were increasing fruit, vegetables, water consumption and restricting sugary foods/drinks; and promotion of moderate to vigorous physical activity. Bespoke ideation sessions led to a context specific design concept: the content (the 'what'), format (mode of delivery) and delivery (by whom) for the three core components, which encompassed eight 'intervention functions' (Education, Persuasion, Incentivisation, Training, Restriction, Environmental restructuring, Modelling and Enablement).

ABSTRACT AWARD SESSIONS

Conclusion: The co-design process generated an evidence- and theory-informed intervention. By integrating evidence synthesis with participatory insights, the Generation H intervention development demonstrates a feasible process for developing contextually relevant behavioural interventions for adolescents in urban Ghana and Kenya.

AA.07-5

Understandings of Ultra-processed Foods: A Qualitative Interview Study of UK Adults with Responsibility for Household Food Activities

M. Essman¹, J.C Parnham², K. Chang², M. Etkind³, P. Shah³, D. Smith³, M. Vasiljevic⁴, E. Boyland⁵, S. Cummins⁶, E.P Vamos², M. White⁷, J. Adams⁷

¹World Food Policy Center, Duke University, Sanford School of Public Policy, Durham, United States, ²Public Health Policy Evaluation Unit, Imperial College London, School of Public Health, London, United Kingdom, ³Imperial College London, Public Contributor, London, United Kingdom, ⁴Durham University, Department of Psychology, Durham, United Kingdom, ⁵University of Liverpool, Department of Psychology, Liverpool, United Kingdom, ⁶London School of Hygiene & Tropical Medicine, Department of Public Health, Environments & Society, London, United Kingdom, ⁷MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom

AA.07: Awards 7: Policies and Environments and Participatory research
Room 7, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: Despite growing public discussion, little is known about how individuals understand and act on the idea of ultra-processed foods (UPFs). This study explored public perceptions of UPFs and their relationship to health, how these are shaped by information sources and food environments, whether perceptions influence purchasing and consumption, and participants' views on possible solutions for reducing UPF intake.

Methods: Semi-structured interviews were conducted with 30 adults aged 22–65 years across the UK, recruited using social media to capture diversity in gender, age, ethnicity, and education. Data were transcribed verbatim and analysed using reflexive thematic analysis in NVivo, with coding refined through team discussions and input from a Public Involvement and Engagement (PIE) group to enhance interpretive depth.

Results: Five themes captured how participants understood and navigated UPFs: (1) understanding of the concept; (2) influences shaping these understandings; (3) decision-making around UPFs; (4) barriers and enablers to reducing consumption; and (5) proposed solutions. Participants expressed uncertainty about what qualifies as a UPF, often equating “processing” with chemical additives, industrial production, or loss of naturalness. UPFs were commonly contrasted with “real” or “home-made” foods and associated with value-laden and health-related judgements. Food processing was described as a continuum, with confusion about where the boundary lies between processed and ultra-processed foods. Understanding was shaped more by trust, personal experience, and perceived credibility of information sources than by nutritional knowledge. Industry-sponsored information was viewed sceptically, while relatable voices such as social media influencers who shared similar personal stories were often seen as more trustworthy. While some participants avoided foods they perceived as ultra-processed, purchasing and consumption were more strongly driven by cost and convenience, with taste and family preferences playing a lesser role.

Conclusion: Public understandings of UPFs differ markedly from scientific and policy classifications, reflecting conceptual ambiguity and the influence of everyday information sources. Improving communication about food processing should go beyond increasing knowledge to help people navigate conflicting information and uncertainty. Policy efforts should combine clearer communication with structural measures that make less processed options more accessible and appealing.

LifeLab Dublin: Co-creating a Health Literacy Intervention with and for Young People

H. Goss¹, L. Burke¹, N. Gavigan¹, C. Smith², S. Belton¹

¹Dublin City University, School of Health and Human Performance, Dublin, Ireland, ²Royal College of Surgeons Ireland, Department of Public Health and Epidemiology, Dublin, Ireland

ABSTRACT AWARD SESSIONS

AA.07: Awards 7: Policies and Environments and Participatory research

Room 7, May 27, 2026, 3:00 PM - 4:00 PM

Purpose: LifeLab Dublin is a health literacy intervention co-designed with and for young people from disadvantaged communities in Ireland. Since 2019, the project has engaged diverse stakeholders (students, teachers, health professionals, and community partners) in collaboratively shaping LifeLab's educational content, delivery models, and research priorities. By embedding co-design at the core of intervention development and iterative refinement, the intervention has sought to enhance relevance, accessibility, and long-term behavioural impact among young participants while generating evidence for participatory practice in health literacy promotion.

Methods: Using a participatory approach, a range of methods have been utilised including questionnaires, focus groups, interviews, and co-design workshops, Photovoice, and stakeholder consultations. To date, participants have included over 500 secondary school students, over 50 teachers, approximately 30 LifeLab facilitators, and representatives from local health and education sectors. Activities focused on exploring young people's lived experiences of health, identifying barriers to engagement, and collaboratively designing curriculum materials, resources, and outreach strategies. Data were gathered through Photovoice, reflective journals, and audio recordings. Reflexive thematic analysis and collaborative sense-making has been used to identify shared priorities and emergent themes.

Results: The co-design process led to the development of a series of Vignettes, the identification of prioritised health topics, and the co-creation of activities and resources. Participants have provided insight on what, and how they would like to learn about health literacy. This includes the need for practical hands-on experiences, providing choice, and relating the content and learnings to real life. These findings have been reflected by research with class teachers, who emphasised the importance of authentic role models, and cited the LifeLab Facilitators (trained undergraduate students) as key factors in the intervention's success. These outcomes have informed the refinement of the LifeLab intervention.

Conclusion: This work demonstrates the value of participatory methodologies in bridging health literacy education and real-world application for young people, particularly those from traditionally underserved communities who can stand to benefit most from improved health literacy. Ongoing evaluation and capacity-building efforts continue to expand the model, offering a scalable framework for embedding youth voice and co-design in health literacy research and practice.

Longitudinal Associations between Screen Time Patterns and Cognitive Development among Preschool Children

V. Carson¹, M. Boyd¹, Y. Zheng¹, C. Rinaldi¹, R. Moldenhauer¹, M. Potter¹, J. Rai¹, J. Li¹, K. Dorn¹, S. Wiebe¹

¹University of Alberta, Edmonton, Canada

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Major gaps limit the comprehensive understanding of ST and cognitive development associations in preschoolers. The objectives of this study were to examine longitudinal: 1) ST patterns (i.e., type, device, content, context) and 2) associations between ST patterns and cognitive development in preschool children.

Methods: Data from the TEChnology and Development in Early Childhood (TECH) project was used. Participants included 359 preschool children (baseline: 3, 3.5, or 4 years $\pm$ 2 weeks) and their parents from Western Canada. ST patterns (type: show/movie/video, electronic game, communication [video calls]; content: parent-defined educational or entertainment, researcher-defined educational or entertainment; device: television, mobile [tablet/smartphone]; context: co-use with adult, evening) were parent-reported using a 2-week online daily diary at baseline and 6- and 12-month follow-ups. Cognitive development (language, response inhibition, working memory, self-control) was assessed at baseline and 6- and 12-month follow-ups via four established short games administered by researchers during a recorded virtual meeting. Generalized Estimating Equations and Linear Mixed Models adjusted for covariates were conducted.

Results: Across the three time points (13,435 days of data), total ST did not significantly increase, however, educational content (2.9-4.5 min/day change) and communication (14.3% change in >0 min/day) ST significantly decreased, whereas, electronic game (5% change in >0 min/day), entertainment content (4.5-6.9 min/day change), and evening (1.9 min/day change) ST significantly increased. With time held constant, higher show/movies/video, parent-defined educational and entertainment content, and evening ST were significantly associated with less advanced response inhibition. Higher show/movie/video, mobile device, and parent-defined entertainment content ST was significantly associated with less advanced self-control. The opposite was observed for communication ST and response inhibition and electronic game ST and working memory. For language, significant age by ST pattern interactions were observed for electronic game and parent-defined educational content ST. For response inhibition, significant age by ST pattern interactions were observed for researcher-defined educational content and evening ST. For working memory, a significant age by researcher-defined entertainment content ST interaction was observed.

Conclusion: Some ST patterns appeared more detrimental to cognitive development than others. Findings can inform more nuanced ST recommendations and interventions aiming to minimize harm and maximize benefits of this societal reality.

Food Avoidant Profiles in Early and Middle Childhood: The Role of Temperament, Sensory Sensitivity, and Food Neophobia in the APPETITE Cohort

O. Arman¹, J. Blissett², C.G. Russell¹, A.J. Burnett¹, A. Pickard³, C. Farrow²

¹Institute for Physical Activity and Nutrition, Deakin University, Geelong, Australia, ²School of Psychology, Aston University, Birmingham, United Kingdom, ³School of Health in Social Science, University of Edinburgh, Edinburgh, United Kingdom

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Food avoidance is a persistent problem for some children and affects dietary quality. While temperament, sensory sensitivity, and food neophobia are each linked to food avoidance, these child characteristics are likely to interact in complex ways that shape how food avoidance manifests across children. Examining profiles provides a person-centred approach to understanding the diverse pathways that underlie food avoidance, rather than assuming a single pattern of behaviour. This study aimed to identify food avoidant profiles and examine how incorporating child characteristics enhances understanding of these profiles over time.

ORAL ABSTRACT SESSIONS

Methods: This study analysed secondary data from the APPETITE study; a longitudinal investigation of UK children's eating behaviours. At Time 1 (T1; n = 995, child ages 3-6, M= 4.4 years, 52% girls), parents completed an online survey including subscales from the validated Child Eating Behaviour Questionnaire (CEBQ) and Children's Behaviour Questionnaire - Very Short Form (CBQ-VSF). Two years later (T2; n = 514, child ages 5-8, M= 6.8 years, 52% girls) parents completed the Child Food Neophobia Scale (CFNS, short form) and the Reduced Glasgow Sensory Questionnaire (rGSQ). Latent Profile Analyses were conducted at T1 and T2, with model fit evaluated using AIC, BIC, and minimum class size (>5%).

Results: At T1, five profiles were identified, including two food avoidant profiles: moderately food avoidant (16%) and food avoidant (10%). At T2, four profiles emerged, with one food avoidant profile (29%). Compared with Time 1, the Avoidant profile increased in proportion, indicating that food avoidance remained stable or even became more pronounced for some children as they got older. Including sensory sensitivity and food neophobia at T2 revealed five distinct profiles, with two food avoidant profiles: moderately food avoidant (19%) and food avoidant (28%), differing significantly in food neophobia and sensory sensitivity.

Conclusion: Food avoidant profiles vary across childhood, with avoidance becoming more delineated when sensory and neophobia traits are considered. These findings suggest that incorporating child characteristics provides a richer understanding of food avoidance profiles that may inform tailored interventions to support children at risk of poorer dietary quality.

O.1.01-3

Longitudinal Associations between General Parenting in Early Childhood and Eating Competence in Adolescence

J. Rahkola¹, R. Lehto^{1,2}, H. Vepsäläinen², M. Maukonen^{1,3}, N. Serasinghe^{1,2}, J. Björkqvist^{1,4}, I. Tillman², M. Erkkola², E. Roos^{1,5,6}, C. Ray^{1,2}

¹Folkhälsan Research Center, Helsinki, Finland, ²University of Helsinki, Department of Food and Nutrition, Helsinki, Finland, ³Finnish Institute for Health and Welfare, Helsinki, Finland, ⁴University of Aberdeen, Institute of Applied Health Sciences, Aberdeen, United Kingdom, ⁵University of Helsinki, Department of Public Health, Helsinki, Finland, ⁶Uppsala University, Department of Food studies, Nutrition and Dietetics, Uppsala, Sweden

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Parents shape children's eating habits, including what, when, and how they eat. General parenting refers to the overall approach to raising children, creating a family emotional climate. It has been associated with children's food consumption but also with other aspects of eating behavior, such as emotional and disordered eating. However, longitudinal research remains limited, and associations with eating competence have not yet been examined. Eating competence describes a positive and flexible approach to food and eating, encompassing attitudes, food acceptance, internal regulation, and management of the food context. We explored whether general parenting in preschool age was associated with eating competence in early adolescence.

Methods: The sample comprised 218 child-parent dyads from the DAGIS study in Finland. Baseline data was collected in 2015–2016 (children aged 3–6 years) and follow-up data in 2023 (10–14 years). At baseline, parents completed a 29-item version of the Comprehensive General Parenting Questionnaire (CGPQ) assessing five constructs: nurturance, structure, behavioral control, inappropriate control, and overprotection (items rated on five-point Likert scale). At follow-up, adolescents completed a preliminary Finnish translation of the Satter Eating Competence Inventory 2.0 (possible score 0–48). Data were analyzed using linear mixed-effects models, adjusted for child sex, baseline age, and parental education.

Results: Higher parental nurturance (B=2.66, 95% CI= 0.13, 5.18) and structure (B=4.58, 95% CI= 1.92, 7.24) when children were preschoolers were associated with higher eating competence score in early adolescence. By contrast, behavioral control, inappropriate control and overprotection were not associated with eating competence. Parents generally reported high nurturance, structure, and behavioral control, and low inappropriate control and overprotection.

Conclusion: Our findings suggest that parenting characterized by responsiveness to the child's needs and autonomy support (nurturance), and by a consistent organization of the child's environment to foster child development (structure) in early childhood may predict higher eating competence in adolescence. Similar parenting dimensions have also been linked to healthier food consumption and lower levels of maladaptive eating behaviors in previous research. Future studies should confirm these findings in larger, more diverse samples and explore how combinations of the five CGPQ constructs relate to eating competence.

ORAL ABSTRACT SESSIONS

O.1.01-4

Food Parenting in Motion: A Latent Transition Analysis of Stability and Change in a Daily Diary Study

O. De-Jongh González¹, L.C. Mâsse¹

¹University of British Columbia, School of Population & Public Health, Vancouver, Canada

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity
Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Most studies examine food parenting practices (FPP) as stable, independent behaviors. In reality, parents combine and adjust multiple practices from day to day. Capturing how FPP configurations unfold over time is crucial to understand the balance between feeding consistency and flexibility.

Objective: This Daily Diary identified daily FPP typologies, estimated typology transitions across nine days, and examined predictors of predominant typology and day-to-day stability/instability among families with 2.5-6-year-olds.

Methods: Parents (n=306; age 40yrs; 60% mothers) completed a 9-day Daily Diary using a validated FPP tool measuring child involvement, autonomy support, nondirective support, meal routines, healthy opportunities, rules and limits, and coercive control. Latent Class Analysis identified distinct daily typologies. Latent Transition Analysis estimated probabilities of remaining in or switching between typologies across days. Linear and logistic regressions examined predictors of predominant typology, stability, and change.

Results: Two time-invariant typologies emerged: *Consistent Guidance* (45%), combining multiple structured and autonomy-supportive practices, and *Basic Structure* (55%), emphasizing routines and limits only. Day-to-day *stability* (probability of remaining in the same typology) ranged from 79-95%, with 42% of parents never switching typologies. Transitions were asymmetric, more often shifting from *Basic Structure* to *Consistent Guidance*. At baseline, mothers (OR=1.88) and families whose children had higher fruit and vegetables intake (OR=1.09) were more likely to use *Consistent Guidance*, and higher income families spent less time using *Consistent Guidance* ($\beta=-0.18$ to -0.34). Across days, *instability* (number of switches) was greater for older parents ($\beta=0.13$), families with less food-responsive children ($\beta=-0.15$) and those with lower fruit and vegetables intake ($\beta=-0.13$). Conversely, *stability* (longest consecutive run) was greater for younger parents ($\beta=-0.15$) and parents with children with higher fruit and vegetables intake ($\beta=0.13$), food responsiveness ($\beta=0.11$), and emotional overeating ($\beta=0.12$).

Conclusion: Daily FPP clustered into two typologies that were largely stable yet showed meaningful day-to-day variation. Greater instability among higher-income and older parents, and when children were less responsive to food, suggests that busy schedules or concern about insufficient eating may prompt shifts in strategies. Identifying who sustains structured, autonomy-supportive practices clarifies predictors of consistency and informs future work on its role in fostering healthy family environments.

O.1.01-5

Mothers Practising, Fathers Encouraging. A Structural Equation Modelling Analysis of Parental Support for Physical Activity

F. Rodriguez-Rodriguez¹, C. Brennan², N. Aguilar-Farias³, R.E. Rhodes²

¹Pontificia Universidad Católica de Valparaíso, IRyS Group, School of Physical Education, Viña del Mar, Chile, ²University of Victoria, School of Exercise Science, Physical and Health Education, Victoria, Canada, ³Universidad de La Frontera, Department of Physical Education, Sports and Recreation, Temuco, Chile

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity
Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: This study aimed to examine how maternal and paternal physical activity (PA) and supportive parenting behaviours predict moderate-to-vigorous physical activity (MVPA) among children and adolescents, and whether these associations vary according to child age and parental gender in a Latin American context.

Methods: This Chilean cross-sectional study included 780 parents (390 mothers, 390 fathers) and 390 school-aged children (193 boys, 197 girls), with 61.8% (n=241) of the sample composed of adolescents. PA levels were self-reported for children using the Youth Activity Profile (YAP) questionnaire, and parental support was measured using a 5-item Likert scale. The analysis followed a three-step approach: (1) Exploratory Factor Analysis (EFA) to identify the underlying factor structure of parental support behaviours, (2) Confirmatory Factor Analysis (CFA) to validate the factor structure

ORAL ABSTRACT SESSIONS

and assess model fit, and (3) Structural Equation Modelling (SEM) to test predictive relationships. Analyses were stratified by age group (children/adolescents) and gender (girls/boys). The analysis was conducted with SPSS V25 and JASP statistical package V0.18.3. Missing data were imputed using the missForest package in R.

Results: Five factors were identified in mothers associated with encouragement, logistical support, and Co-activity, which explained 61.3% of the variance. Three factors were identified in fathers (62.4% of variance) related to encouragement and parental regulatory support, as determined by the EFA and CFA. Parental support predicted MVPA in age-specific ways: among children, maternal encouragement was positively associated with MVPA ($\beta=4.17$, $p<.05$), while combined co-activity/regulation showed a negative association ($\beta=-7.42$, $p<.05$). Among adolescents, co-activity/parental PA behaviour and encouragement/regulation were associated with MVPA ($\beta=10.98$ and $\beta=12.39$, respectively; $p<.05$). Fathers' encouragement was $\beta=3.54$ ($p<.05$) for children's MVPA and $\beta=13.89$ ($p<.05$) in adolescents' MVPA.

Conclusion: These findings reveal a gendered and developmentally sensitive pattern of parental influence. Maternal support strongly predicts adolescents' MVPA, while paternal support remains modest and stable. Since mothers often serve as primary promoters of children's PA, interventions for adolescents should particularly engage mothers, whereas child-focused programs should involve both parents. Encouraging greater paternal participation during adolescence and co-designing age- and gender-specific public health strategies may enhance PA promotion among youth.

O.1.01-6

Harnessing Youth Storytelling to Reduce Sugary Drink Intake and Prevent Childhood Obesity: Results from the H₂GO! Cluster Randomized Trial

M. Wang^{1,2}, S. Alatorre³, A. Schwarz⁴, J. Weinberg⁵, J. Aldworth⁶, L. Sprague Martinez⁷, R. Kadel⁵, S. Lemon⁸, M. Rosal⁸

¹Boston University School of Public Health, Community Health Sciences, Boston, United States, ²Harvard School of Public Health, Health Policy and Management, Boston, United States, ³Boston University, Community Health Sciences, Boston, United States, ⁴Boston Medical Center, Boston, United States, ⁵Boston University School of Public Health, Boston, United States, ⁶Massachusetts Alliance of Boys and Girls Clubs, Ludlow, United States, ⁷University of Connecticut, Hartford, United States, ⁸University of Massachusetts Medical School, Worcester, United States

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Excess sugar-sweetened beverage (SSB) consumption remains a leading contributor to childhood obesity worldwide. H₂GO! is a narrative-based behavioral intervention co-developed through an academic-community partnership with Boys & Girls Clubs (BGCs) to reduce youth SSB intake and obesity risk. This cluster randomized controlled trial tested the efficacy of H₂GO! on child body mass index z-scores (zBMI) and beverage intake compared with usual care. We hypothesized that participants in H₂GO! sites would show greater reductions in zBMI and SSB intake and greater increases in water intake than those in control sites. The study advances research by integrating *youth-created narratives*—a novel motivational approach to enhance engagement and parental involvement—and testing a scalable delivery model within trusted community settings.

Methods: Between 2020 and 2025, 11 BGC sites in Massachusetts were randomized to the intervention or usual care. Participants were 437 parent-child dyads (mean child age = 10.0 ± 1.0 years; 68% eligible for free/reduced-price lunch; 42.6% Hispanic/Latino, 29.5% non-Hispanic White, 15.8% non-Hispanic Black, 10.8% non-Hispanic Other, 1.5% non-Hispanic Asian). The 6-week, in-person intervention was delivered by trained BGC staff and included interactive sessions, youth-created narratives, and take-home activities targeting SSB reduction and water promotion. Primary outcome: child zBMI derived from staff-measured child height and weight; secondary outcomes: SSB and water intake (beverage intake questionnaire). Assessments occurred at baseline, 2, 6, and 12 months. Multilevel mixed-effects models accounted for clustering by site and adjusted for covariates.

Results: At 12 months, intervention youth demonstrated significantly greater reductions in zBMI compared with controls ($\beta = -0.19$, SE = 0.09; $p = 0.036$). Within-group analyses showed reductions in SSB intake (-3.7 fl oz/day; $p = 0.024$) and increases in water intake ($+6.6$ fl oz/day; $p = 0.003$) among intervention participants; control sites showed no significant changes.

Conclusion: Participation in H₂GO! was associated with reduced child zBMI and improved beverage behaviors among ethnically diverse, low-income youth. Embedding youth-driven narratives in community settings demonstrates promise as a theory-informed approach to motivation and behavior change. Findings advance behavioral nutrition and implementation science by leveraging community infrastructure for sustainable delivery and may inform future efforts to promote nutrition and health.

ORAL ABSTRACT SESSIONS

O.1.01-7

BMI Percentile Is Consistently Associated with Adiposity across Racial/Ethnic Groups in U.S. Children

W. Heerman¹, L. Samuels²

¹Vanderbilt University Medical Center, Pediatrics, Nashville, United States, ²Vanderbilt University Medical Center, Biostatistics, Nashville, United States

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Body mass index (BMI) is widely used to assess child adiposity, but concerns have been raised about its accuracy across racial and ethnic groups. This study evaluated whether race and ethnicity modify the association between BMI percentile and objective adiposity measures.

Methods: We analyzed data from the National Health and Nutrition Examination Survey (NHANES) from 2011 through 2018, focusing on children 8 through 19 years old with BMI percentile and dual-energy X-ray absorptiometry (DEXA) data. Adiposity measures included fat mass index and android/gynoid fat ratio. We used unweighted proportional odds regression models stratified by sex, with restricted cubic splines and interactions between age, race/ethnicity, and BMI percentile. Model-based outcomes were plotted across BMI percentiles for various age and racial/ethnic combinations. Due to model complexity, individual coefficients and p-values were not reported.

Results: The analysis included 6,835 children (48% girls), with a median age of 13.3 (IQR 10.5, 16.4) and median BMI percentile of 74.2 (IQR 42.8, 93.2). Racial/ethnic distribution was 21.1% Mexican American, 24.3% non-Hispanic Black, 27.1% non-Hispanic white, and 27.5% other. As expected, higher BMI percentiles were associated with higher measures of adiposity at all ages. When comparing across different racial and ethnic groups, there were not clinically meaningful differences in associations between BMI percentile and either fat mass index or android/gynoid ratio. For example, among 12-year-old boys at the 95th BMI percentile, predicted fat mass index was 9.5 (95% confidence interval 9.2, 9.7) for Mexican American children, 9.1 (8.7, 9.4) for non-Hispanic Black children, and 9.4 (9.1, 9.7) for non-Hispanic white children. Among 16-year-old girls at the 95th BMI percentile, predicted android/gynoid ratio was 0.99 (0.98, 1.00) for Mexican American children, 0.96 (0.94, 0.97) (95% CI) for non-Hispanic Black children, and 0.97 (0.96, 0.98) for non-Hispanic white children. Similar patterns were observed across all groups.

Conclusion: Race and ethnicity did not modify the relationship between BMI percentile and objective adiposity measures in a clinically meaningful way. Despite any potential limitations of BMI in approximating total fat mass or fat mass distribution, BMI percentile showed consistent associations across racial and ethnic groups.

Nutritional and Glycemic Disparities in Gestational Diabetes: Insights from a Swedish Randomized Controlled Trial

N. Kaegi-Braun¹, J. Ribrant¹, E. Söderström Shields¹, M. Löf¹

¹Karolinska Institutet, Medicine Huddinge, Stockholm, Sweden

O.1.01 Children and families: Developmental Trajectories: Longitudinal Perspectives on Child Nutrition and Activity Auditorium, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Gestational diabetes mellitus (GDM) is rising globally and disproportionately affects socioeconomically vulnerable populations. While Sweden is a high-income country with universal healthcare, little is known about disparities in dietary behaviors and glycemic control among women with GDM. Understanding these differences is essential for tailoring interventions and promoting equitable maternal health outcomes.

Methods: Data were drawn from an ongoing multicenter randomized controlled trial in Sweden evaluating a mobile health (mHealth) solution for GDM management. We analyzed data collected at gestational week 37 and baseline questionnaires. Three social determinants of health (SDOH) were examined: country of birth (foreign-born vs. Swedish-born), education (no university degree vs. university degree), and food security status (food-insecure vs. food-secure). Primary endpoints included daily dietary intake (energy, carbohydrate, fat, and protein) and daily continuous glucose monitoring (CGM)-derived metrics (time in range [TIR], mean glucose, and variability). Associations were assessed using linear regression models adjusted for intervention group, clinic, parity, BMI, and age.

Results: Among 264 participants, 30% were foreign-born, 39% had no university degree, and 4.7% were food-insecure.

ORAL ABSTRACT SESSIONS

Dietary intake data were available for 207 participants; mean daily intake was 1,842 kcal, 171 g carbohydrates, 89 g fat, and 80 g protein. Foreign-born and food-insecure women tended to have lower energy and fat intake (adjusted β for energy: foreign-born -149 kcal [$p = 0.086$], food-insecure -354 kcal [$p = 0.087$]; for fat: foreign-born -15.8 g [$p = 0.004$], food-insecure -24.5 g [$p = 0.057$]). Educational attainment showed no association with dietary measures. CGM data were available for 72.7% of participants; mean TIR was 96.8%, mean glucose 5.0 mmol/L, and variability 16.6%. Women with a university degree had higher TIR (adjusted β 1.82% [$p = 0.010$]) and a trend toward lower variability (-1.23% [$p = 0.056$]); other SDOH showed no association with CGM indicators.

Conclusion: We observed a gap in glucose management by education level, despite no significant dietary differences. Foreign-born and food-insecure women showed trends toward lower energy and fat intake. These findings highlight the need to integrate SDOH into precision GDM management to improve care and equity. Future analyses will explore additional factors such as physical activity.

O.1.02-1

Policy Instruments for Promoting Sport and Physical Activity among Women and Girls: A Review of International Policy Documents

X. Li¹, R. Giulianotti^{1,2}, S. Costa¹

¹Loughborough University, School of Sport, Exercise and Health Sciences, Loughborough, United Kingdom, ²University of South-Eastern Norway, Department of Sports, Physical Education and Outdoor Studies, Telemark, Norway

O.1.02 Policies and environments: Food Systems, Governance and Equity in Nutrition and Physical Activity
Room 1, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Policy plays a critical role in shaping population-level sport and physical activity behaviours. However, there's limited understanding of the specific measures recommended for promoting sport and physical activity among women and girls in international policies. This study aimed to collate international policy documents that include measures to enhance participation among women and girls, and analyse the policy instruments mentioned in these documents.

Methods: We searched the websites of ten international organizations relevant to the promotion of sport and physical activity (e.g., UNESCO, Women Sport International, and International Olympic and Paralympic Committees), particularly among women and girls, for potential documents. The resulting documents were reviewed by stakeholders in the fields of sport policy and gender equality, and 62 documents were included for analysis. Content analysis was employed, combining deductive and inductive approaches to structure and interpret the data. Schneider and Ingram's typology of policy instruments, which differentiates between authority, incentive, learning, capacity, symbolic and hortatory tools, provided the theoretical framework for this analysis. Sub-themes within each category were then generated inductively, to capture the specific tools emerging from the texts.

Results: Half of the recommended policy instruments were categorized as capacity tools (e.g., embedding gender equity in training sport professionals), with symbolic and hortatory tools (e.g., delivering education campaigns) also common. Learning tools were suggested slightly more than incentive tools, while authority tools were mentioned the least. Overall, the policies emphasised creating enabling environments (e.g., adapting facilities and equipment to be gender-sensitive), promoting inclusivity for diverse subgroups (e.g., indigenous women and girls), advancing women's roles within the sport system, embedding gender-specific needs (e.g., accommodating dress options), raising the visibility of women in sport, fostering cooperation (e.g., partnership between governments, non-governmental organizations, and private sector), supporting targeted resource allocation, and improving the evidence base to address gender inequalities in sport and physical activity participation.

Conclusion: International policies recommend a diverse set of policy instruments to promote women and girls' participation, yet the level of emphasis given to each instrument type differs. Future work should assess the extent to which recommended instruments are implemented in practice and their impact on participation outcomes.

ORAL ABSTRACT SESSIONS

O.1.02-2

The Green Gap Framework: Understanding Non and Low Use of Urban Greenspaces

A. Johnstone¹, R. Bushby², R. Hunter³, S. Rodgers⁴, C. Ward Thompson⁵, A. Williams⁶, B. Wheeler⁷, R. Mitchell¹

¹University of Glasgow, General Practice and Primary Care, Glasgow, United Kingdom, ²Consultant, Edinburgh, United Kingdom, ³Queen's University Belfast, Centre for Public Health, Belfast, United Kingdom, ⁴University of Liverpool, Public Health, Policy & Systems, Liverpool, United Kingdom, ⁵University of Edinburgh, OPENspace Research Centre, Edinburgh School of Architecture and Landscape Architecture, Edinburgh, United Kingdom, ⁶University of Edinburgh, Scottish Collaboration for Public Health Research and Policy, Edinburgh, United Kingdom, ⁷University of Exeter, European Centre for Environment and Human Health, Exeter, United Kingdom

O.1.02 Policies and environments: Food Systems, Governance and Equity in Nutrition and Physical Activity
Room 1, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Greenspaces are recognised as important for promoting physical activity and supporting mental wellbeing. Yet around 25% of the UK population rarely visit their local greenspaces. These non and low frequency users are disproportionately women, older adults, people with long-term conditions or disabilities, and those from minority ethnic groups. They are also less likely to engage in physical activity and face higher rates of cardiovascular disease, obesity, and mental health conditions. This is despite evidence that these are the people who could derive the most significant health benefits from engaging with greenspaces.

Methods: This research aimed to develop a novel theoretical framework to guide academic, practitioner and policymaker thinking and action to identify and map the modifiable multilevel factors influencing non and low use of greenspace. The framework was iteratively developed through literature reviews, expert consultations, and collaboration with stakeholders across research, policy, and practice.

Results: The output, *The Green Gap Framework*, conceptualises barriers and facilitators across four interconnected domains: Individual, Social & Community, Physical Environment, and Political & Societal. It illustrates how these domains interact to influence engagement (or lack of), providing a tool for better understanding the complex reasons behind low urban greenspace use. To evaluate its relevance and applicability, we mapped policy and research activity against the framework domains. This revealed a predominant focus on individual and physical domains, with less emphasis on systemic and social influences that could have the greatest population-level impact on greenspace use.

Conclusion: The Green Gap Framework has been developed as a dynamic tool that evolves with ongoing empirical research and real-world applications. It can inform future strategies in policy, practice, and urban planning by supporting better understanding and more holistic approaches to greenspace provision and promotion. The ultimate goal is to increase greenspace use, promote physical activity and mental wellbeing, and reduce health inequalities.

O.1.02-4

Examining Variations in Household Food Insufficiency Profiles Following the Termination of Supplemental Nutrition Assistance Program (SNAP) Emergency Allotments in the United States

M. Kasimanickam¹, S. Grutzmacher², H. Bae¹

¹Oregon State University, Corvallis, United States, ²University of Arizona, Tucson, United States

O.1.02 Policies and environments: Food Systems, Governance and Equity in Nutrition and Physical Activity
Room 1, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: The Supplemental Nutrition Assistance Program (SNAP) provides monthly benefits to eligible low-income United States (U.S.) households for food purchases. The SNAP Emergency Allotments (EA), introduced in March 2020, temporarily increased benefits during the COVID-19 pandemic. Their national termination in March 2023 reduced most recipients' benefits. In this study, we hypothesized that the distribution of latent food insufficiency profiles among SNAP households with children would vary following EA termination. This study provides insight into how household characteristics cluster across levels of food insufficiency, highlighting families most affected by benefit reductions and informing targeted policy responses.

Methods: Latent class analysis was used to identify unobserved subgroups of households with similar profiles of

ORAL ABSTRACT SESSIONS

food insufficiency severity and socioeconomic characteristics using nationally representative, repeated cross-sectional data from the U.S. Census Bureau's Household Pulse Survey (June 2022-October 2023). The analytical sample included SNAP households with at least one child from states that maintained EA until national termination, excluding states that ended EA earlier. The pre-termination period spanned June 2022-February 2023 (n=9,688), and the post-termination period spanned March-October 2023 (n=9,327). Model selection was based on Akaike Information Criteria (AIC), Bayesian Information Criteria (BIC), and entropy values.

Results: A three-class solution was favored pre-termination (AIC=153,223; BIC=153,819; entropy=0.64) and a four-class solution post-termination (AIC=149,161; BIC=149,954; entropy=0.60), indicating moderate separation. Pre-termination classes represented food-sufficient (16.2%), moderately insufficient (37.8%), and severely insufficient (46.0%) profiles. Food-sufficient households were more likely to be higher income, college educated, and married, whereas severely insufficient households were lower income, less educated, and unmarried. Post-termination classes included food-sufficient (11.0%), mildly insufficient (31.3%), moderately insufficient (19.5%), and severely insufficient (38.2%) profiles. Post-termination profiles showed greater variation in income, education, and marital status, though socioeconomic disadvantage remained concentrated in classes reflecting greater food insufficiency.

Conclusion: These findings demonstrate how EA termination shaped food insufficiency profiles among households with children. The emergence of new intermediate classes in the post-termination model may reflect greater stratification of food hardship rather than improvement. Policymakers should address the impacts of policy termination and systemic inequities that heighten households' risk of food insufficiency. This study offers insights to inform equitable public health policies and targeted interventions.

O.1.02-5

The Role of the Energy-adjusted Dietary Inflammatory Index in the Relationship between Metabolic Syndrome and Acculturation among U.S. Immigrants: Results from NHANES 2005–2018

C. Arcan¹, E. Foka Nzaha², N. Ramezani³, E. Prom-Wormley², M. Brooks⁴

⁴Virginia Commonwealth University, Family Medicine, Richmond, United States

O.1.02 Policies and environments: Food Systems, Governance and Equity in Nutrition and Physical Activity
Room 1, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Metabolic syndrome (MetS) represents a growing public health concern among U.S. immigrants. Acculturation has been linked to diet-related health outcomes, yet the mechanisms connecting acculturation and MetS remain unclear. The primary objective of this study is to examine the association between acculturation and MetS among immigrants and evaluate whether diet quality (energy-adjusted Dietary Inflammatory Index (e-DII)), functions as a mediator, effect modifier, or confounder in this relationship. The secondary objective is to evaluate the association of acculturation with individual components of the MetS.

Methods: A cross-sectional study of 6,160 adult immigrants (age ≥18 years, born outside the U.S.) participating in the 2005–2018 National Health and Nutrition Examination Survey (NHANES). Acculturation was assessed using nativity and language-related variables. MetS was defined using standard criteria, including central obesity, blood pressure, glucose, high-density lipoprotein, and triglycerides. Multivariate linear and logistic regressions were conducted in SAS 9.4 to test mediation, moderation, and confounding effects of e-DII on the acculturation–MetS relationship. This method was also used to examine association with individual components of MetS. All analyses accounted for NHANES's complex survey design and adjusted for demographic covariates (education and race/ethnicity.)

Results: The sample mean age was 45.3 years (51% female). Significant univariate associations we found between acculturation and MetS ($\beta = 0.445$, $p < 0.0001$) and acculturation and e-DII ($\beta = -0.241$, $p = 0.0096$); e-DII was not significantly associated with MetS ($\beta = 0.027$, $p = 0.0685$). The e-DII did not satisfy the Baron and Kenny's mediation assumptions and was not a significant effect modifier ($p = 0.230$). When examined as a confounder, e-DII minimally altered the acculturation–MetS association (magnitude of change in estimate = 2.2%). Systolic blood pressure, waist circumference, and fasting glucose were most strongly associated with acculturation status.

Conclusion: Among immigrants in the United States, there was no evidence that e-DII mediated or modified the association between acculturation and MetS. In this study e-DII was not associated with MetS. Since e-DII was a significant confounder, future research should consider including e-DII as a confounder in the associations between acculturation and MetS among immigrants in the US.

O.1.02 Policies and environments: Food Systems, Governance and Equity in Nutrition and Physical Activity
Room 1, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Many low- and middle-income countries face a double burden of malnutrition (DBM), characterized by the simultaneous presence of undernutrition along with overweight, obesity, and/or other diet-related noncommunicable diseases. The BIA-Obesity tool (Business Impact Assessment on Obesity and Population-level Nutrition) was developed by INFORMAS (International Network for Food and Obesity / Non-communicable Diseases Research, Monitoring and Action Support) for a systematic assessment and benchmarking of private sector commitments and practices for addressing obesity and unhealthy diets. However, it does not fully account for issues related to the DBM, particularly undernutrition. Therefore, this study aimed to extend the BIA-Obesity tool for use in contexts characterized by a DBM.

Methods: We followed the DELPHISTAR reporting guideline and conducted a three-round Delphi study with 30 international experts on private food industry policies and the commercial determinants of health, from April to October 2024. We implemented two rounds of online assessments, with an optional 2-hour collaborative workshop in between (held twice, online and in-person), to gather feedback from participants on 16 potential indicators addressing undernutrition and/or the DBM, previously identified through a systematic review. Likert scales were used for the assessments of indicators, and the data were analyzed descriptively and presented in the form of histograms. Qualitative feedback was thematically summarized and informed the (re)phrasing of indicators.

Results: Consensus (i.e., group agreement of 75% or higher) was reached for eight indicators covering i) food fortification, ii) use of traditional foods, iii) use of discounts and donations, iv) healthy diets at work, v) breastfeeding support, vi) parental leave for employees, and the production, distribution and marketing of vii) breastmilk substitutes and viii) complementary foods. One overarching indicator on corporate strategy was additionally included by the author team, despite marginally lower agreement (68%).

Conclusion: Food industry action may complement other efforts to address the DBM, such as public policies and investments. Through a three-stage Delphi process, we extended the BIA-Obesity tool to include new indicators related to undernutrition and/or the DBM. The expanded tool enables a comprehensive and resource-efficient assessment and benchmarking of the food industry's voluntary commitments and practices in countries with high prevalences of both under- and overnutrition.

O.1.02-7

The Healthiness and Environmental Sustainability of Food and Beverages Price Promoted by a Major Australian Supermarket

T. Scapin¹, C. Gomez-Donoso¹, S. Pettigrew², K. Backholer¹, A. Cameron¹

¹Deakin University, Global Centre for Preventive Health and Nutrition, Melbourne, Australia, ²The George Institute for Global Health, University of New South Wales, Sydney, Australia

ORAL ABSTRACT SESSIONS

O.1.02 Policies and environments: Food Systems, Governance and Equity in Nutrition and Physical Activity Room 1, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Unhealthy diets increase the risk of non-communicable disease and adversely impact the natural environment through food system activities, including food production, packaging, and retail. Food environments shape dietary behaviours and offer opportunities to promote both healthy and environmentally sustainable diets. This study evaluated the healthiness and environmental sustainability of price promoted food and beverages within a major Australian supermarket chain in 2024.

Methods: Two databases on the monthly price promotion strategies applied to packaged foods by a major supermarket retailer in Australia in 2024 ('PriceTracker') and the healthiness and environmental sustainability metrics of such products ('FoodSwitch'/'EcoSwitch') were used to assess: (1) the yearly average percentage of products on price promotion, (2) the average healthiness (using the Health Star Rating - HSR score) and the environmental impact (using the Planetary Health Rating - PHR score) of price and non-price promoted products, and (3) the magnitude of discounts. Analyses were conducted overall and by 'Core' vs. 'Discretionary' products.

Results: A total of 111,441 observations (9,287 unique products) were analysed. On average, 28.4% of the packaged foods available for sale each month were price promoted. Overall, 60.3% of price-promoted products were classified as less healthy ($HSR \leq 3$) and 87.0% as less sustainable ($PHR \leq 3$). The proportion of price-promoted foods and the magnitude of discounts were significantly higher for products classified as less healthy (versus healthier), discretionary (versus core), and less sustainable (versus more sustainable). When combined, healthier and more sustainable products were promoted about half as often as less healthy and less sustainable products and received smaller discounts.

Conclusion: Our findings highlight that current price promotion strategies in a major supermarket chain in Australia tend to favour less healthy and less sustainable food products. Retail initiatives and food policies that limit price promotion strategies on these items, and incentivise healthier and more sustainable purchases, should be considered to deliver benefits for both human and planetary health.

O.1.02-8

Does Walkability Explain Inequalities in Active Mobility? Findings from Curitiba, Brazil

R. Reis¹, A.A. de Paula da Silva¹, A.A. Ferreira Hino²

¹Washington University in Saint Louis, People Health, and Place Unit, Prevention Research Center, School of Public Health, Saint Louis, United States, ²Pontifícia Universidade Católica do Paraná, School of Medicine, Graduate Program in Health Sciences, Curitiba, Brazil

O.1.02 Policies and environments: Food Systems, Governance and Equity in Nutrition and Physical Activity Room 1, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Active transportation (walking, cycling, and public transit) benefits public health and sustainability, but its uptake is often uneven across gender and socioeconomic groups. The built environment may also influence inequalities in active travel. However, evidence is limited on how gender, educational, and socioeconomic disparities in active transportation vary across life stages and neighborhood contexts in Low and Middle-Income Countries. This study examines these inequalities across adolescents, adults, and older adults in Curitiba, Brazil, and their variation by neighborhood walkability and by income at the area level.

Methods: We conducted three cross-sectional household surveys in Curitiba, with samples of adolescents (n=503), adults (n=699), and older adults (n=620) (2010, 2013-14, and 2017-18, respectively). Neighborhoods were classified into four quadrants based on deciles of built environment walkability (land-use mix, household density, and street connectivity) and area-level income (high/low walkability × high/low income) from the 2010 census data. Active mobility (walking, bicycling, or public transit use ≥ 1 time/week) as examined through the inequality framework to analyze differences by gender, education level, and socioeconomic status. The Slope Index of Inequality (SII) quantified absolute inequalities across the socioeconomic spectrum for each age group and quadrant.

Results: Walking and bicycling were more prevalent among adolescents and adults, while public transit use was more common among older adults. Marked inequalities in active transportation emerged, especially in low-walkability, low-income areas. Gender gaps in cycling were significant among adolescents and adults, with males far more likely to bicycle than females. Socioeconomic and educational disparities were most pronounced in adults, particularly for public transit and walking, with lower-SES and less-educated adults more reliant on these modes. In contrast, high-walkability or higher-income neighborhoods showed more equitable participation in active transportation

ORAL ABSTRACT SESSIONS

(smaller SII values). Inequality patterns for older adults varied by neighborhood context, indicating that supportive environments (high-walkability areas) were associated with smaller active transportation gaps in this group.

Conclusion: In Curitiba, Brazil, gender, educational, and socioeconomic inequalities in active transportation are evident across all age groups and are exacerbated in under-resourced, less walkable neighborhoods. Equity-focused urban planning and transport interventions are needed to promote equitable active transportation for all groups.

O.1.03-1

Solo or Team? A Meta-analysis Comparing Individual vs. Group-based Approaches on Physical Activity, Functional, Psychosocial, and Health Outcomes

C. Thøgersen-Ntoumani^{1,2}, M. Kritz^{3,4}, D. Olsen⁵, S. Harden⁵, S. Burke^{6,7}, H. Riddell⁸, N. Ntoumanis^{1,2}

¹University of Southern Denmark, Danish Centre for Motivation and Behaviour Science (DRIVEN), Department of Sports Science and Clinical Biomechanics, Odense, Denmark, ²University of Birmingham, School of Sport, Exercise, and Rehabilitation Sciences, Birmingham, United Kingdom, ³Curtin University, School of Population Health, Perth, Western Australia, Australia, ⁴University for Continuing Education, Department of Economy and Health, Krems, Austria, ⁵Virginia Tech, Department of Human Nutrition, Food and Exercise, Blacksburg, United States, ⁶Western University, School of Health Studies, London, Ontario, Canada, ⁷Children's Health Research Institute, London, Ontario, Canada, ⁸Curtin University, Curtin School of Population Health, Perth, Western Australia, Australia

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health
Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: To update and extend existing evidence, quantitatively comparing the effectiveness of group-based (in-person and online) versus individual physical activity (PA) interventions on behavioral (PA), functional, psychosocial, and health outcomes, and test whether formats are meaningfully different or equivalent. Key innovations include inclusion of online/virtual group formats, three-level meta-analytic modeling, and equivalence testing (TOST).

Methods: Records (N=16,779) were screened, resulting in the inclusion of 71 studies (N=523 effect sizes) across 18 countries (adults ≥18 y; experimental, quasi-experimental, and observational designs). Outcomes included PA (primary), plus functional (e.g., strength, balance), psychosocial (e.g., QoL, loneliness), and health (e.g., VO₂max, BMI). Effects were standardized (Hedges *g*) and synthesized with three-level random-effects models. Prespecified moderators included group type (e.g., “true” groups using group-dynamics principles), delivery mode (online vs in-person), leader type, sample characteristics, frequency, duration, and study quality. Sensitivity analyses addressed outliers and publication bias; TOST probed equivalence when main effects were non-significant.

Results: For PA, pooled effects slightly favored groups but were non-significant ($k=125$; $g=0.086$; 95% CI $-0.061, 0.233$). After outlier checks, effects remained small and non-significant; TOST indicated statistical equivalence between formats ($z=-1.667$, $p=0.048$). For functional outcomes, groups showed a small, significant advantage after outlier removal ($k=151$; $g=0.164$; $p=0.015$) and in analyses limited to experimental/quasi-experimental studies ($g\approx0.175$, $p=0.044$). Psychosocial ($k=104$; $g=0.292$; $p=0.214$) and health outcomes ($k=137$; $g=0.125$; $p=0.096$) favored groups but were non-significant overall. “True” groups showed larger health effects compared to standard classes; online groups performed comparably to in-person groups. Study quality was moderate-to-high; GRADE certainty was low to moderate.

Conclusion: Overall, group and individual formats produce equivalent PA changes, suggesting both are viable, scalable routes to behavior change. Group-based formats may confer additional functional benefits. Given comparable effects for online groups, virtual delivery may extend reach and equity without sacrificing effectiveness. Practitioners and policymakers might offer choice-based or hybrid models tailored to preference, context, and outcome targets, and prioritize “true” group processes when functional or health gains are the goal. Future trials should improve reporting of group processes, standardize outcome measures, and test mechanisms (e.g., need support, social identity) to optimize format selection and implementation.

ORAL ABSTRACT SESSIONS

O.1.03-2

Experiences and Perceptions of Food Bank Use among Racial and Ethnic Minority Groups in High-income Countries; A Qualitative Systematic Review

E. Ansell¹, M. Murphy¹, K. Hurley¹, L. Tappin², R. Prabhu², M. Pallan¹

¹University of Birmingham, College of Medicine and Health, School of Health Sciences, Department of Applied Health Sciences, Birmingham, United Kingdom, ²University of Birmingham, College of Medicine and Health, School of Medical Sciences, Birmingham Medical School, Birmingham, United Kingdom

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Food insecurity (FI), defined as inadequate access to sufficient, safe and nutritious food for a healthy and active lifestyle, is a growing public health issue in high-income countries (HICs). FI disproportionately affects racial and ethnic minority groups and is associated with negative health outcomes, including increased risk of chronic diseases, mental health disorders, and poorer development and academic outcomes among children. Food banks are widely relied upon to alleviate FI, yet evidence suggests services may be underutilised or experienced differently by racial and ethnic minority groups due to cultural, social, and systemic factors. Despite a growing body of research, no systematic review has synthesised qualitative evidence to examine these experiences specifically. This review aims to explore how racial and ethnic minority groups in HICs experience, perceive, and engage with food banks, and to identify the socio-cultural and structural factors influencing food bank access and use.

Methods: This qualitative systematic review follows the Joanna Briggs Institute (JBI) methodology and will report according to PRISMA guidelines. Electronic searches were conducted in MEDLINE, Embase, Web of Science, CINAHL, ASSIA, and PubMed, supplemented by hand-searching. Eligible studies (1) focused on racial or ethnic minority groups in HICs; (2) used qualitative methods; (3) examined experiences or perceptions of food bank use; and (4) were published from 2008 onward. Records were screened independently by two reviewers. Quality appraisal is being conducted using the JBI Critical Appraisal Checklist for Qualitative Research. Thematic synthesis will be used for analysis.

Results: 5,064 records were screened at title and abstract stage, with 4,923 excluded. After full text screening, 34 studies met the inclusion criteria. Data extraction, quality appraisal, and thematic synthesis are ongoing and expected to be completed by January 2026. Preliminary observations indicate recurring themes related to stigma, cultural appropriateness and acceptability of food banks and barriers in referral pathways and access.

Conclusion: This is the first systematic synthesis focused specifically on racial and ethnic minority groups' experiences of food bank use in HICs. The findings are expected to support the development of more inclusive, culturally responsive, and equitable food aid policy and practice.

O.1.03-3

Influence of Diet Quality on Body Composition, Cardiometabolic Health and Weight Gain in Pregnancy

E. Söderström Shields¹, J. Sandborg^{1,2}, M. Flor-Aleman³, P. Henriksson⁴, M. Löf¹

¹Karolinska Institutet, Department of Medicine, Huddinge, Stockholm, Sweden, ²Region Östergötland, Linköping, Sweden, ³University of Granada, Department of Nutrition and Food Science, Faculty of Health Sciences, Melilla Campus, Melilla, Spain, ⁴Linköping University, Department of Health, Medicine and Caring Sciences, Linköping, Sweden

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Diet is key for a healthy lifestyle. However, evidence on how diet quality affects body composition and cardiometabolic health during pregnancy is insufficient. The aims of this study were to examine associations of diet quality (Swedish Healthy Eating Index [SHEI]) with body composition, cardiometabolic health in early and late pregnancy (gestational weeks 14 and 37) and gestational weight gain (GWG).

Methods: This observational study used cross-sectional and longitudinal data from the HealthyMoms trial at two timepoints: early (n=302) and late pregnancy (n=134). Exposure was diet quality (SHEI), and outcomes included body composition (body fatness, BMI, fat mass index [FMI]), cardiometabolic health (homeostatic model assessment for insulin resistance [HOMA-IR], metabolic syndrome [MetS] score, glycemia), and GWG. Linear regression was used to

ORAL ABSTRACT SESSIONS

investigate associations between SHEI and outcome measures.

Results: In the cross-sectional analyses, higher SHEI was associated with lower body fatness, BMI, FMI and MetS score in early pregnancy (all $b \leq -0.14$; all $P \leq 0.02$). Similar results were seen in late pregnancy, with the addition of an association with HOMA-IR (all $b \leq -0.23$; all $P \leq 0.008$). Longitudinally, a high SHEI in early pregnancy was associated with lower body fatness, BMI, FMI, glycemia, HOMA-IR and MetS score in late pregnancy (all $b \leq -0.22$, all $P \leq 0.01$). There were no statistically significant associations of change in SHEI with GWG or any other outcome ($P \geq 0.09$).

Conclusion: A healthy diet, especially in early pregnancy, seems beneficial for body composition and cardiometabolic health. Focusing on key dietary advice, as captured by SHEI, could therefore be advantageous and a feasible target within maternity care.

O.1.03-4

Supporting Physical Literacy at School and Home (SPLASH): A Randomized Controlled Trial of a Multilevel Intervention Increases Child Physical Activity Levels

E. Hennessy¹, B. Wilhite¹, P. Bakun¹, J. Blouin², S. Chouiakh¹, K. Chui³, S. Herrick⁴, C. Odalen⁴, A. Toliver⁴, J. Sacheck⁵

¹Tufts University Friedman School of Nutrition Science and Policy, Boston, United States, ²George Washington University/Milken Institute School of Public Health, Washington, DC, United States, ³Tufts University School of Medicine, Boston, United States, ⁴New York Road Runners, New York, United States, ⁵Brown University School of Public Health, Providence, United States

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health
Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: To report a main outcome of the SPLASH trial, an innovative multilevel intervention combining school-based physical literacy (PL) programming with family engagement strategies, on children's moderate-to-vigorous physical activity (MVPA) and sedentary behavior.

Methods: We conducted a group randomized controlled trial across three socioeconomically disadvantaged school districts in Massachusetts and Virginia (N=164 children, grades 3-5), USA. Districts were randomized to SPLASH intervention (n=111 children, 4 schools from two districts) or delayed-intervention control (n=53 children, 1 school from 1 district) over one academic year. The SPLASH intervention included the Rising New York Road Runners Program inclusive of a: (1) school-based PL programming delivered through physical education, (2) Social Cognitive and Self-Determination theory-informed family engagement program including emails, text messaging, and online resources, and (3) school technical support and promotional materials. Preliminary results for objectively measured minutes of PA/day (ActiGraph over 7 days) at baseline and post-intervention (8 months) are reported. Linear mixed-effects models with two-level (students nested within district) random intercepts tested intervention effects, modeled as intervention*timepoint interaction, adjusted for child age, sex, and race/ethnicity.

Results: The SPLASH intervention significantly increased children's daily MVPA by 8.07 minutes/day compared to control (95% CI: 0.16-15.97, $p=0.046$). Out-of-school MVPA demonstrated similar gains ($\beta=8.37$ min/day, 95% CI: 1.92-14.83, $p=0.011$), while during-school MVPA demonstrated similar but statistically non-significant patterns ($\beta=2.03$ min/day, 95% CI: -0.97-5.03, $p=0.185$). Notably, weekend sedentary time decreased significantly in intervention versus control groups ($\beta=-77.3$ min/day, 95% CI: -132.8 to -21.8, $p=0.006$), representing a reduction of approximately 1.3 hours of sedentary behavior on weekends.

Conclusion: SPLASH demonstrates that multilevel PL interventions integrating school and family components can effectively increase children's MVPA and reduce sedentary time in socioeconomically disadvantaged populations. Findings provide empirical evidence that theory-informed PL-focused programming can address the well-documented decline in PA during elementary years and offer a scalable approach for promoting lifelong physical activity habits in underserved communities. Future analyses will assess the impact of the intervention on PL constructs.

ORAL ABSTRACT SESSIONS

O.1.03-5

Does Habits Attenuate the Relationships between Affective Judgements and Physical Activity Behaviour in a Longitudinal Study

A. Divine¹, R.E Rhodes²

¹University of Leeds, Leeds, United Kingdom, ²University of Victoria, Victoria, Canada

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Positive affective judgements about physical activity are associated with both repeated behaviour and formation of habits. Habits may attenuate the impact of variations in affect and behaviour. As behaviour becomes more habitual it may blunt some of the influence of affective-based motivation. The purpose of this study was to assess if habit attenuates the relationship between affect and physical activity.

Methods: A total of 185 participants (66% female, mean age 45 years $\pm$ 13.95) were enrolled into a 4-week randomised trial (with a 12 week follow up) where they were assigned to either one of three intervention groups (implementation intentions, implementation intentions and imagery, or imagery) or a control group. Participants completed a bi-polar scale of affective judgements, the Godin Leisure Time Questionnaire, and the Self-Report Behavioural Automaticity index to measure habits, pre and post intervention, and during the follow up. Two mediation models were conducted using PROCESSv5 macro (model 4) to assess if habit strength mediated the relationship between affect and physical activities (while controlling for intervention group); one at post intervention and one at follow-up.

Results: Both the post intervention ($R=.32$, $p<.001$) and follow-up models ($R=.19$, $p=.010$) were significant. At post intervention habit partially mediated the relationship between affective judgments and physical activity with the impact of affective judgments on physical activity ($\beta=2.28$, $p<.001$, CI 1.34-3.21) significantly attenuated when habit was added as a mediator ($\beta=1.78$, $p=.001$, CI .78-2.73) with a mediation effect of $\beta=.52$ (CI .15-1.00). However, at follow up, habit fully mediated the relationship between affective judgments and physical activity ($\beta=.73$, $p=.27$, CI -.57-2.05) with a mediation effect of $\beta=1.01$ (CI .41-1.79).

Conclusion: These findings suggest that habit attenuates the relationship between affective judgements and physical activity, as people may no longer be as responsive to affective motives for being active. The influence of habit on variations between affect and physical activity behaviour become stronger over time as habit forms. Thus, developing a habit may help negate the negative variations in affective processing on behaviour, helping people to continue to engage in physical activity regardless of affective judgements of the behaviour.

ORAL ABSTRACT SESSIONS

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Television-viewing (TV), a common leisure-time sedentary behaviour, is associated with kidney dysfunction; however, the longitudinal associations and moderating roles of physical inactivity and type 2 diabetes (T2D) remain underexplored. We examined relationships with 12-year declines in estimated glomerular filtration rate (eGFR – kidney function) of changes in TV time (and potential joint associations with physical inactivity) in middle-aged and older Australians with and without T2D.

Methods: Australian Diabetes, Obesity and Lifestyle Study (AusDiab) data from 6220 baseline participants (age=51±13 years; waist circumference=90.3±13.7cm; women=54.2%) with 5-year or 12-year follow-up data, or both, were analysed; eGFR, TV-viewing time, physical inactivity (<150min/week self-reported physical activity), and glucose metabolism status (normal glucose metabolism – NGM, prediabetes, and T2D) were assessed at each time-point. Multilevel modelling used age (centred at 50 years) as the time metric to estimate the rate of eGFR decline and the effects of TV-viewing time, adjusting for potential sociodemographic and clinical confounders and stratifying by physical activity status.

Results: Participants' mean eGFR decreased, and mean TV time increased over 5 and 12 years. Those with T2D had lower eGFR and higher TV time at each time point compared to those without T2D. At the 50-year age point, the estimated mean eGFR was 97.6 (95%CI: 97.2 to 98.2) mL/min/1.73m², which declined yearly by 0.78 (95%CI: 0.80 to 0.77). Increasing TV time was significantly associated with eGFR decline, and the association was stronger in those with T2D [-0.05 (95%CI: -0.08 to -0.02)] compared to those without. For those who were inactive at any given time-point, higher TV time was associated with a significantly greater eGFR decline [-0.23 (95%CI: -0.45 to -0.01)] compared to physically active participants.

Conclusion: Among adult Australians, increasing TV time over 12 years was associated with an increased rate of kidney function decline. This relationship was heightened in the presence of T2D and in those who were physically inactive. These longitudinal findings strengthen the evidence base for kidney health on the detrimental effects of excessive sedentary behaviour and physical inactivity, particularly in those with T2D. They further reinforce the clinical and public health importance of meeting recommended sedentary behaviour and physical activity guidelines.

O.1.03-7

Internalized Weight Bias and Physical Activity in Higher-weight Canadian Adolescents: A Three-year COMPASS Study

K. Lucibello¹, E. Pila¹, S. Leatherdale², K. Patte³

¹Western University, London, Canada, ²University of Waterloo, Waterloo, Canada, ³Brock University, St. Catharines, Canada

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Internalized weight bias—devaluation of self due to higher body weight—is a well-established barrier to physical activity behaviour, although existing evidence is largely cross-sectional and exclusive to adult samples. By focusing on aerobic activity, research has also overlooked how internalized weight bias may relate to participation in less controllable and more socially evaluative environments such as sport. This study is the first to examine the between- and within-person associations between internalized weight bias and physical activity modalities (moderate-to-vigorous physical activity, resistance training, sport) in a cohort of adolescents with higher-weight perceptions over time.

Methods: Participants were Canadian adolescents from the prospective COMPASS study. Adolescents who perceived themselves as higher-weight ($N = 2,485$; $M_{\text{age}} = 13.8$ (1.1) years; 53.4% cis-girls) annually completed self-report surveys during the 2021/22 (T1), 2022/23 (T2), and 2023/24 (T3) school years. Assessments included internalized weight bias, resistance training (days/week), MVPA (minutes/day), and organized sport participation (yes/no). Data were analyzed using a linear mixed-effects model (MVPA) and generalized linear mixed models (resistance training, sport), while controlling for gender, age, and province.

Results: The sample reported high average daily MVPA ($T1 = 87.2 \pm 66.1$, $T2 = 90.9 \pm 65.7$, $T3 = 90.2 \pm 71.7$), and over 60% of participants engaged in resistance training at least once a week. Approximately 1 in 4 adolescents participated in organized sport ($T1 = 29.8\%$, $T2 = 27.7\%$, $T3 = 23.1\%$). Adolescents with higher average levels of internalized weight bias over time reported lower MVPA ($\beta = -4.6$, 95% CI = -6.9, -2.2) and lower odds of resistance training at least once a week (compared to no days; OR = 0.9, CI = 0.8, 0.9). The between-person association between internalized weight

ORAL ABSTRACT SESSIONS

bias and sport participation was not significant. Contrary to hypotheses, there were no significant within-person associations across physical activity modalities.

Conclusion: These findings suggest that individual differences in internalized weight bias, rather than variation over time, are most relevant in predicting physical activity. Understanding individual differences in internalized weight bias development across adolescence may elucidate critical periods during which interventions to reduce internalized weight bias could be most effective, in turn supporting MVPA and resistance training.

O.1.03-8

Nine-year Evolution of Sustainable Food Choice Motives in Food Purchases and their Association with Sociodemographic Characteristics among French Adults

C. Metzger¹, S. Péneau¹, J. Baudry¹, C. Méjean², C. Prioux¹, M. Touvier¹, S. Hercberg¹, E. Kesse-Guyot¹, B. Allès¹

¹Nutritional Epidemiology Research Team (EREN), Seine-Saint-Denis, Bobigny, France, ²INRAE, Hérault, Montpellier, France

O.1.03 Motivation and behavior change: Drivers of Change: Examining Habits, Motives, and Interventions in Health Room 2, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Food sustainability increasingly interests French consumers and could influence their food choices, but the evolutions of sustainable motives during food purchases has been little explored. This study aimed to estimate potential changes in food choice motives over 9 years, in a French cohort; and to identify associated sociodemographic characteristics.

Methods: This study included 16,184 adults who responded twice to a food choice motive questionnaire (2013 and 2022) with a focus on sustainability. This questionnaire consisted of 63 items covering 8 dimensions: ethics and environment, traditional and local production, taste, price, health, convenience, innovation and absence of contaminants. A score between 0 and 10 was computed for each motivation for all food groups and meat. The participants were classified into three groups based on changes in their scores: « increase », « decrease » and « stable », using the Minimal Important Difference, which represented the smallest significant variation in scores (based on 2013 scores as a threshold). Polytomous logistic regressions were used to assess the association between these groups and sociodemographic characteristics, mutually adjusted.

Results: Across all food groups, ethics and environment motive had the highest increase: from a mean score of 5.7 in 2013 (S-d : 2.2) to 6.6 (S-d :2.2) in 2022 ($p < 0.001$). Participants with a higher level of education were more likely to present an increase for this motive (OR : 1.59 ; 95% CI = 1.09 ; 2.32, $p = 0.02$), as well as younger participants (18-30 than >30 years old ($p < 0.001$)). Men were more likely to present a decrease for this motive than women (OR: 1.25 ; 95% CI = 1.05 ; 1.50, $p = 0.01$). Men and younger participants were more likely to present an increase in health motives than women and people over 30 years old.

Conclusion: This study brings new knowledge on the evolution of food choice motives over time in specific groups. In view of the challenges of transition of food sustainability, it's important to know which population groups to target in order to promote sustainable eating.

ORAL ABSTRACT SESSIONS

O.1.04 Ageing: Integrating physical activity, urban design, and nutrition to support healthy ageing and cognition
Room 3, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Examination of trends in handgrip strength (HGS) can improve insights into trends in population health and help evaluate the impact of implemented public health policies. This study quantified national (country-level) and international (pooled global data) temporal trends in adult handgrip strength (HGS).

Methods: Six databases/web search engines (MEDLINE, SPORTDiscus, Embase, Web of Science, CINAHL, and Google Scholar) and other sources (reference lists of included studies and topical reviews) were systematically searched up to 24 October 2024. Full-text, refereed, observational studies reporting HGS norms for adults (aged 20+ years) by sex and age were included. Countries (i.e., studies/datasets) were included if available data spanned 10+ years. Monte Carlo simulated pseudodata were generated following harmonisation for methodological variation. International sex- and age-specific norms, normalized by height (Ht) in metres (m) squared (i.e., HGS/Ht² in kg/m²), were used to convert HGS values into z-scores for all countries. Population-weighted linear regression models were used to calculate temporal trends.

Results: Temporal trend meta-analyses were conducted on a dataset representing 2,209,557 adults from 30 countries between 2000 and 2021. Internationally, there was a small (per decade) decline in normalised HGS (effect size [ES]: -0.24 [95%CI: -0.24, -0.24]), with the decline 1.6-fold larger after the year 2010. Sex- and age-specific temporal differences were negligible (ES < 0.10). Trends differed by country, with most (60% [18 of 30]) experiencing declines. National trends ranged from a small (per decade) decline in Lithuania (ES: -0.36 [95%CI: -0.39, -0.32]) to a large improvement in Singapore (ES: 0.97 [95%CI: 0.89, 1.06]) and Ireland (ES: 0.97 [95%CI: 0.94, 1.00]).

Conclusion: The recent international decline in normalised HGS among adults is suggestive of a corresponding decline in strength capacity and general health. Growing recognition of the importance of muscle strength as a population health marker highlights the need for continued tracking of temporal trends, especially among low- and lower-middle-income countries for which repeated cross-sectional survey data are few.

O.1.04-2

Bi-directional Associations between Physical Functioning and Trajectories of Five Physical Activity Components in Community Dwelling Older Adults

B. Hoogerheide^{1,2,3}, L. Schaap^{1,2,3}, M. Visser^{1,3}, T. Hoekstra^{1,2,3}, E. Maas^{1,2}

O.1.04 Ageing: Integrating physical activity, urban design, and nutrition to support healthy ageing and cognition
Room 3, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Physical activity (PA) and physical functioning influence each other throughout life. When functioning declines during aging, it becomes harder to stay active, and when activity decreases, functioning often worsens. However, this bi-relationship is usually studied through a focus on one of these directions, rather than *accounting for both directions of the association*. Building on findings from the Longitudinal Aging Study Amsterdam (LASA), which identified long-term trajectories in each of five PA components (duration, intensity, strength, mechanical strain, and turning actions), this study is the first to examine the bi-directional association between ten-year activity trajectories of multiple PA components and physical functioning.

Methods: Longitudinal Aging Study Amsterdam data includes a representative cohort of older Dutch adults. Previously identified PA trajectories were linked to measures of physical functioning (self-reported functional limitations and objective physical performance tests) for 4,963 participants (52% women; mean age = 66 years, SD = 8.6). Analyses were performed in two steps: first it was studied whether baseline physical performance and baseline functional limitations are associated with membership of PA trajectories with multinomial logistic regression; second, it was studied whether PA trajectory membership were associated with later-life physical performance with linear regression and functional limitations with multinomial logistic regression. All analyses were stratified by sex and adjusted for demographic, health, and lifestyle factors.

Results: Preliminary results show that higher baseline physical performance increased the odds of belonging to a more active PA trajectory, while higher baseline functional limitations decreased these odds. These associations held after adjustment for confounders and did not show marked differences between sex or PA components. After ten years of follow-up, membership in more active trajectories for duration, intensity, and strength predicted higher physical performance scores, except for intensity in men and strength in women. Trajectories for mechanical strain and turning actions were not associated with physical performance.

ORAL ABSTRACT SESSIONS

Conclusion: These findings support a bidirectional relationship between physical activity and functioning. Better functioning increases the likelihood of remaining active, while maintaining higher intensity, strength, or longer activity duration is linked to better functional outcomes. Understanding these two-way associations can help refine strategies to promote independence and healthy aging.

O.1.04-3

Understanding Influencing Factors in Physical Activity Promotion for Older Men: A Capability Approach Perspective

T. Schuck^{1,2}, **J. Loss**³, **S. Tittlbach**¹

¹University of Bayreuth/BaySpo – Bayreuth Center of Sport Science, Social and Health Sciences in Sport, Bayreuth, Germany, ²FAU Erlangen-Nürnberg/Department of Sport Science and Sport, Education in Sport, Erlangen, Germany, ³Robert Koch Institute (RKI), Department Epidemiology and Health Monitoring, Berlin, Germany

O.1.04 Ageing: Integrating physical activity, urban design, and nutrition to support healthy ageing and cognition
Room 3, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Promoting physical activity is a key strategy to support healthy ageing, yet older men remain an underrepresented target group in physical activity promotion. To develop physical activity promotion strategies, it is crucial to understand how individual, social, and structural factors shape physical activity behavior in this population. The capability approach provides a promising framework for capturing these dynamics by introducing capabilities as an intermediate level between conversion factors and actual behavior, thereby emphasizing individuals' freedoms to engage in an active lifestyle. However, its empirical application remains limited. This study applies the capability approach to explore how individual and socio-structural conversion factors relate to perceived capabilities for an active lifestyle and actual physical activity behavior among men aged 50 years and older in a community setting.

Methods: A cross-sectional survey was conducted with 316 men (age: $M = 64.87$, $SD = 9.70$). Partial least squares structural equation modeling (PLS-SEM) was employed to assess associations between individual conversion factors (e.g., individual barriers, self-efficacy), socio-structural conversion factors (e.g., social support, structural barriers), perceived capabilities for an active lifestyle, and actual physical activity behavior. The explanatory and predictive power were evaluated, and alternative model specifications were compared.

Results: Individual ($r = -.38$, $f^2 = .17$) and structural ($r = -.26$, $f^2 = .07$) conversion factors were significantly associated with perceived capabilities ($R^2 = .28$). Higher perceived capabilities were positively related to higher actual physical activity levels ($r = .32$, $f^2 = .12$). However, the explained variance in actual physical activity behavior was modest ($R^2 = .10$). The estimated model demonstrated good predictive power and superior fit compared to alternatives.

Conclusion: Findings emphasize the importance of considering the interplay of diverse conversion factors and perceived capabilities in promoting physical activity among older men. As social conversion factors showed no significant associations in this sample, future research should further examine different profiles of conversion factors and how they interact across subgroups. In doing so, the capability approach offers a comprehensive perspective that goes beyond behavior change, highlighting that promoting equitable capabilities can be considered a meaningful goal in itself within physical activity promotion.

O.1.04-4

Longitudinal Associations between 24-hour Movement Behaviours and Cognitive Function in Adults Aged 55 and Above

P.-J. Marent^{1,2}, **G. Cardon**², **G. Albouy**^{3,1}, **J. van Uffelen**¹

¹KU Leuven, Physical Activity, Sports and Health Research Group, Department of Movement Sciences, Leuven Brain Institute, Leuven, Belgium, ²Ghent University, Research Group Physical Activity and Health, Department of Movement and Sports Sciences, Ghent University Research for Aging Young, Ghent, Belgium, ³University of Utah, Department of Health and Kinesiology, College of Health, Salt Lake City, United States

O.1.04 Ageing: Integrating physical activity, urban design, and nutrition to support healthy ageing and cognition
Room 3, May 28, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Age-related cognitive decline poses challenges to healthy ageing. Physical activity (PA), sedentary behaviour (SB) and sleep have been linked to cognitive health, yet much evidence is cross-sectional and fails to account for the interdependent nature of these 24-hour movement behaviours. This observational study applied a compositional approach to investigate longitudinal associations between 24-hour movement behaviours and cognition in healthy adults aged 55+.

Methods: Community-dwelling adults aged ≥ 55 years were assessed at three time points, each one year apart (baseline $n=233$; 51.1% women; 68.3 ± 7.7 years). Each time, 7-day wristworn accelerometry data (ActiGraph wGT3XBT) were acquired and processed with GGIR to derive time spent in PA, SB and sleep. Additionally, cognition was measured using the Cambridge Neuropsychological Test Automated Battery (CANTAB), yielding composite z-scores for executive function (EF), short-term memory (STM), long-term memory (LTM) and processing speed (PS). Linear mixed-effects models tested longitudinal associations between time-use composition (i.e. 24-hour movements behaviours expressed as isometric log-ratios) and cognition, including an interaction term between time-use composition and time, and were adjusted for sociodemographic and health covariates. Posthoc compositional isotemporal substitution estimated cognitive differences associated with time reallocations between behaviours.

Results: No significant associations were observed between time-use composition and STM, LTM or PS. After adjusting for age, sex, educational level and social isolation, EF was significantly associated with time-use composition ($p = 0.005$) and time ($p < 0.001$), with no significant interaction effect, suggesting a stable relationship over time. Post-hoc analyses indicated that moderate-to-vigorous PA (MVPA) was the primary driver of the EF association. While reallocating time from light PA (LPA) to SB showed some positive EF differences, reallocations from LPA or sleep to MVPA were associated with better EF z-scores. Conversely, reallocating time away from MVPA related to lower EF, underscoring its central role.

Conclusion: In adults aged ≥ 55 , 24-hour movement behaviours were associated with EF but not memory or PS, and these associations remained stable over time. Maintaining or increasing time in MVPA may support cognitive health, highlighting the need for intervention studies to confirm these findings. Future research should also examine the context of behaviours.

O.1.04-6

Retention of Dietary Behaviors and Cardiometabolic Outcomes 12 Months after a Plant-forward Dietary Intervention in Older Adults

M.E Shoemaker¹, B. Oliveira de Vargas¹, S. Vaezi¹, A.M Barry¹, L. Weidauer¹, S. Qureshi², M. Perry², M. Dey¹

O.1.04 Ageing: Integrating physical activity, urban design, and nutrition to support healthy ageing and cognition
Room 3, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: While many nutrition-based interventions have reported positive results, it is unknown if intervention focused behaviors are maintained long-term. The purpose of this study was to examine if dietary intake, body composition, and cardiometabolic health from the end of a plant-forward feeding trial were retained ~12 months post-trial.

Methods: This study assessed participants at the end of the PRODMED2 feeding trial (Post Feeding Phase, PFP) and a 12-month follow-up (Feeding Sustainability Phase, FSP) to evaluate maintenance of healthy lifestyle behaviors post-trial. Older adults 65 years+ ($n=32$) who completed both the PRODMED2 feeding trial and follow-up visit were analyzed at the end of trial (PFP) and at an average of 12-month follow up (FSP). Dietary intake, body composition (weight, height, BMI, waist circumference (WC), fat mass (FM), lean mass, and cardiometabolic health (total cholesterol (TC), high-density lipoprotein (HDL) cholesterol, low-density lipoprotein (LDL) cholesterol, non-HDL, and glucose) were analyzed. Paired t tests or Wilcoxon signed-rank tests compared values between the two phases. Statistical significance was defined as a $p < 0.05$.

Results: Energy (+375 kcal), protein (+16g), fat (+31g), and sugar (+26g) all increased ($p < 0.0002-0.05$), while fiber decreased (-11g) ($p = 0.0002$) and carbohydrates remained the same ($p = 0.599$). Multiple micronutrients (vitamin A, -208.2mcg; thiamin, -0.4 mg; vitamin B12, +1.1mcg; vitamin C, -58.8mg; vitamin D, +117.4 IU; vitamin K, -75.7 mcg, and sodium, +506.1mg) changed significantly from PFP to FSP ($p < 0.0001 - 0.0498$). DBP (+6.2mmHg), TC (+11.6mg/dL), HDL (+6.4mg/dL), TC:HDL (-1.7), glucose (+9.7mg/dL), weight (+3.8kg), BMI (+0.9kg/m²), android fat (+376.3g), gynoid fat (+532.4g), visceral fat (+205.6g), and total FM (3.4kg) increased by FSP ($p < 0.0001 - 0.0393$), with a decrease in WC (-3.4cm, $p = 0.0228$) and no change in TG, non-HDL, LDL, and lean mass ($p > 0.05$).

ORAL ABSTRACT SESSIONS

Conclusion: In this cohort of older adults, most dietary, body composition, and cardiometabolic measures worsened during the 12 months following the PRODMED2 feeding trial. Given the substantial resources required for feeding trials, incorporating strategies such as behavior change-based education is critical to support long-term adherence and sustain the health benefits achieved during interventions, ultimately promoting healthier aging.

O.1.04 Ageing: Integrating physical activity, urban design, and nutrition to support healthy ageing and cognition
Room 3, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: We examined whether implementing a program that promotes movement in acute care would lead to improved physical activity and frailty levels during hospitalization.

Methods: The Breaking Bad Rest study is a randomized, two-arm controlled trial. A total of 50 participants over 60y were randomized into either the physical activity intervention group or the control group within 24 hours of admission to a geriatric acute care unit; we used a six-block design and stratification by pre-hospital mobility. Intervention participants were visited twice daily by a researcher to set step goals, provide feedback, and walk with the participant if needed. A target of up to ~20% increase in step counts from the previous day was initially used. The control group received usual care and was visited twice daily for brief conversations to ensure the same level of social engagement as the intervention group. The primary outcome was a frailty index derived from a health questionnaire at admission, weekly for the first month, monthly thereafter, at discharge and one-month post-discharge. Both groups wore activity monitors (activPAL and StepWatch) to measure daily steps, upright time, and sit-to-stand transitions. Descriptive statistics, between-group mean comparison, and mixed effects models were used to examine group and time effects on frailty and physical activity levels.

Results: Participants were 78.7±8.3 years old and 50% were female. The baseline characteristics of each group was not significantly different. Frailty was not different at each time point during hospitalization; admission frailty was 0.35±0.10 for the control group and 0.33±0.11 for the intervention group ($p=0.415$). Average daily upright time (control: 48.59±55.00; intervention: 30.01±30.85; $p<0.001$) and sit-to-stand transitions (control: 20.46±24.28; intervention: 14.46±11.78; $p<0.001$), but not steps (control: 347.33±606.76; intervention: 305.59±469.54; $p=0.279$) were different between groups. Mixed models demonstrated no significant differences in group ($\beta=0.004$; $p=0.863$), time ($\beta=0.000$; $p=0.820$) or interaction effect ($\beta=[-0.001]$; $p=0.078$) on frailty. Similarly, group did not effect steps ($\beta=2.389$; $p=0.072$), upright time ($\beta=[-0.074]$ $p=0.633$), and sit-to-stand transitions ($\beta=0.088$; $p=0.053$), differently over time.

Conclusion: The Breaking Bad Rest study failed to increase physical activity and correspondingly, improve frailty levels in acute care.

ORAL ABSTRACT SESSIONS

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health
Room 4, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Accelerometers are widely used to objectively assess physical activity, sedentary behaviour and sleep in health research. Despite widespread use, reporting of accelerometer-based research remains inconsistent, limiting transparency, comparability, reproducibility, and preventing data harmonisation across studies. We aimed to develop TRACE, the first international, consensus-based reporting guidance to standardise and improve accelerometry reporting.

Methods: We conducted a multi-phase project following the EQUATOR Network's framework for developing reporting guidelines. First, a scoping review was conducted to identify existing reporting guidance, which informed candidate reporting items. We then conducted a two-stage eDelphi survey, with an international, multidisciplinary panel of researchers, clinicians, journal editors and device manufacturers, who rated the importance of the proposed items. Items achieving a pre-defined consensus threshold of $\geq 70\%$ as critically important were retained. An online consensus meeting was then held to finalise the reporting guidance.

Results: The scoping review identified 47 publications containing reporting guidance, from which 124 unique reporting items were extracted and synthesised. A refined set of items was presented in the eDelphi survey based on team discussions. Round 1 was completed by 111 participants and round 2 by 93 participants, representing over 25 countries. Forty-one items reached consensus for inclusion; 11 items did not. The consensus meeting added five items and excluded six, resulting in 46 items forming the TRACE checklist. TRACE emphasises transparent reporting of device setup, wear protocols, data processing and analytic decisions. An accompanying explanation and elaboration document provides detailed rationale and examples of good reporting practice to support implementation by researchers, reviewers, and journals.

Conclusion: TRACE delivers the first international, consensus-based framework to standardise accelerometry reporting in health research. By promoting transparent and consistent reporting, TRACE enhances opportunities for data harmonisation, replication and evidence synthesis. Ultimately, TRACE aims to strengthen methodological rigour, facilitate cross-study comparisons and improve the translation of accelerometry-derived evidence into public health and clinical practice.

7 - Phenotyping of Environment-physical Activity Dynamics in Youth during the Summer: A Multilevel Dynamic Structural Equation Modeling Approach

T. Prochnow¹, J.-H. Park¹, V. Croan¹, G. Dunton², K.M. Pollack Porter³, K. de la Haye², C. Lee¹

¹Texas A&M University, College Station, United States, ²University of Southern California, Los Angeles, United States,

³Johns Hopkins University, Baltimore, United States

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health
Room 4, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: To identify distinct phenotypes characterizing heterogeneous patterns in how social and built environments are associated with future physical activity (PA) among youth during summer. Summer represents a critical period when youth lose access to structured supports and peer networks that facilitate PA during the academic year. Understanding individual differences in environment-PA responsiveness during this vulnerable period can inform just-in-time interventions for youth.

Methods: Ecological momentary assessment was used to collect data from 36 youth in Texas, USA (aged 11-15 years; 1,260 within-day observations) during summer months in May to July 2025. Participants responded to prompts six times daily over seven days, reporting current social environment characteristics (emotional closeness, perceived PA norms, susceptibility to influence from others) and built environment perceptions (perceived safety, pleasantness, PA space availability). Accelerometer-derived moderate-to-vigorous PA in the subsequent 30 minutes was measured. Person-specific coefficients representing individual environment-PA relationships were extracted and subjected to hierarchical cluster analysis using Ward's method to identify distinct digital phenotypes. Multilevel dynamic structural equation modeling (DSEM) was used to examine temporal relationships between environmental perceptions and subsequent PA within the following 30 minutes.

Results: DSEM revealed significant associations between PA space availability ($\beta=0.24$, $p<0.001$) and social influence ($\beta=0.18$, $p<0.01$) with future PA. Cluster analysis identified three distinct phenotypes: Built Environment Responsive ($n=16$, 44%), showing high responsiveness to physical environmental cues; Environment Resistant ($n=5$, 14%), demonstrating minimal responsiveness to environmental factors; and Social Environment Responsive ($n=15$, 42%),

ORAL ABSTRACT SESSIONS

exhibiting strong sensitivity to social network characteristics. Five of six clustering parameters showed significant between-phenotype differences after Bonferroni correction (all $p < .001$), with adequate clustering validity (Dunn index=0.28).

Conclusion: Youth in this sample demonstrated heterogeneous patterns in environment-PA dynamics, supporting the existence of phenotypes. Digital phenotyping of EMA and sensor-based data may enable just-in-time adaptive interventions tailored to individual environment-PA dynamics during summer. For example, these phenotypes could potentially be used to suggest optimal interventions based on sensitivity to social and built environment factors improving effectiveness and sustainability of behavior change programs.

5 - Toward Sustained Engagement in Digital Lifestyle Recommender Systems: Understanding the Role of Emotional Context

S. Evers¹, M. Beigy², P. van Gorp², A. Kemperman¹

¹Eindhoven University of Technology, Built Environment, Eindhoven, Netherlands, ²Eindhoven University of Technology, Industrial Engineering and Innovation Sciences, Eindhoven, Netherlands

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health
Room 4, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Digital lifestyle recommender systems hold significant potential to promote healthier behaviours through personalized interventions, such as suggesting physical activities or supporting healthy dietary choices. Yet, user engagement with these systems often declines rapidly. This study examined how momentary emotions affect user engagement with health recommendations delivered via smartwatches, considering contextual and demographic factors.

Methods: A three-week wearable ecological momentary intervention (EMI) was conducted to deliver health recommendations and collect self-reports alongside sensor data. Thirty participants (M age = 25 ± 3.8 years; M BMI = 23 ± 3.6 kg/m²) received up to ten daily prompts, triggered by time or location. Each prompt included a behavioural nudge for healthy activities in situ, followed by a brief survey capturing momentary emotions and recommendation acceptance using the Pleasure-Arousal-Dominance (PAD) model. Engagement was assessed through compliance rates, response times, and recommendation acceptance. Given the longitudinal and nested data structure, mixed-effects modelling was applied to analyse the relationships between emotional states and user engagement metrics.

Results: Participants engaged for an average of 16 ± 2.5 days, with a consistent mean daily response rate of four prompts per individual. The predominant emotional state when engaging with recommendations was excited (45%), followed by bored (27%), relaxed (20%), and stressed (8%). Recommendation acceptance was negatively affected by low-valence states (stressed: $\beta = -0.54$, $p = .008$; bored: $\beta = -0.68$, $p < .001$). Although response latency and daily compliance did not vary significantly by emotion, participants being bored responded on average more frequently and faster to recommendations. Conversely, individuals with more lower arousal states showed reduced long-term system engagement (relaxed: $\beta = -0.53$, $p = .033$, bored: $\beta = -0.74$, $p < .001$). Social context emerged as a significant influencer, with participants more likely to feel excited when not alone.

Conclusion: Momentary emotional states, influenced by social context, meaningfully shape engagement with digital health recommendations. These findings emphasize the importance of emotional and contextual factors in designing personalized interventions for digital health systems. By leveraging emotional-context patterns, future recommender systems and just-in-time adaptive interventions (JITAIs) can dynamically tailor content and timing to enhance engagement and promote healthier behaviours in everyday life.

6 - Co-designing DESI-heart: Conversational Agent Based Self-care Intervention for People with Cardiovascular Disease

A.T. Sebastian¹, R. Daryabeyghotbehsara¹, P. Jansons¹, R. Maddison¹

¹Deakin University, Institute for Physical Activity and Nutrition, Melbourne, Australia

ORAL ABSTRACT SESSIONS

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health
Room 4, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Cardiovascular diseases (CVDs) are a leading cause of morbidity and mortality worldwide and in Australia. Although effective self-care is essential for CVD management, many individuals face barriers such as complex treatment regimens, limited health literacy, and a lack of culturally appropriate support. Conversational agents (CAs) offer a promising solution by providing AI-driven, voice-based support that enables human-like interaction. However, most existing CAs primarily target mainstream populations, overlooking the unique needs of culturally and linguistically diverse (CALD) communities. This study aimed to co-design and develop the Diaspora Engaged Self-care Intervention (DESI-Heart), a culturally tailored CA to support self-care among individuals with CVDs from the Indian diaspora living in Australia.

Methods: A participatory co-design study was conducted with members of the Indian diaspora in Australia living with CVDs ($n = 15$, aged ≥ 18 years). Three Zoom-based workshops (~1–2 hours each) were held across different phases, using established design methods such as the ‘think-aloud’ approach, ‘bento-box reflections,’ and the ‘MoSCoW’ method to capture user preferences and inform culturally responsive intervention features. Workshop recordings were transcribed and analysed using Braun and Clarke’s reflexive thematic analysis approach through NVivo.

Results: Overall, six themes identified through the co-design process informed the design and key features of the DESI-Heart program, ensuring it was culturally relevant and responsive to the needs of the Indian diaspora community. The identified themes were: (1) cultural context of self-care and unique ideas for the DESI-Heart program, (2) medication management features, (3) culturally appropriate dietary support, (4) physical activity support, (5) mental wellbeing support, and (6) user experience and implementation considerations.

Conclusion: This study provided insights into the needs of CALD populations, helping address cultural and linguistic barriers and inform the development and feasibility testing of the DESI-Heart program

O.1.05

2 - Prompting Large Language Models to Recognize Behavior Change Techniques in Physical Activity Promotion Messages: Development of AI-generated Intervention Messages for AIM4Active

Y. Liao¹, J. Pankaj², L. Bohlen³, G. Brannon⁴, M. Swartz⁵, C. Li²

¹University of Texas at Arlington, Kinesiology, Arlington, United States, ²University of Texas at Arlington, Computer Science and Engineering, Arlington, United States, ³Brown University, Providence, United States, ⁴University of Texas at Arlington, Communication, Arlington, United States, ⁵University of Texas Medical Branch, Galveston, United States

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health
Room 4, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Scaling up theory-based behavior change interventions and implementing them across diverse populations remains challenging because of the intensive resources required to develop intervention content that is personally and contextually relevant to individuals. We aim to develop an AI tool, AIM4Active, which leverages generative large language models (LLMs) to produce intervention messages based on the behavior change techniques (BCTs) and tailored to individual characteristics, behavior patterns, and environmental contexts. We present initial findings on our first development step about how well LLMs identify and interpret BCTs in existing physical activity (PA) promotion messages.

Methods: To determine whether LLMs can understand how a message employs a BCT, we provided a message, its coded BCT, and definition from BCT Taxonomy v1 to LLMs. We tasked LLMs with determining how the technique was present in the message. We allowed LLMs to disagree with the coded technique and provide its reasoning. We analyzed 286 messages and coded BCTs from published PA interventions using two LLMs: a quantized version of Meta’s Llama 3.1 70B Instruct model and a reduced-precision version of OpenAI’s gpt-oss 20B model, both provided by Unsloth. We analyzed these two models to compare agreement levels across different model sizes and reasoning abilities.

Results: Out of the 286 messages, there were 35 messages where one LLM disagreed, and 30 messages both LLMs disagreed with coded technique exhibited in the message. The most disagreed BCT was Goals and Planning techniques that had insufficiently detailed planning prompts. The fewest disagreements came from BCTs Comparison of Outcomes, Regulation, and Covert Learning.

Conclusion: For LLMs to generate theory-based intervention messages aligned with BCTs, they will need to understand each BCT. Findings suggest that feeding LLMs the BCT Taxonomy alone is insufficient for them to fully comprehend

ORAL ABSTRACT SESSIONS

all BCTs. Further training is needed to operationalize LLMs to generate messages specific to BCTs. Human perspective is needed to determine whether BCTs were correctly represented in generated messages. With proper training and prompting techniques, LLMs show great promise for generating theory-based PA-promoting messages and can further incorporating real-time behavioral data (e.g., from fitness trackers) and contextual data (e.g., location-based information like weather).

O.1.05

1 - Evaluation of a Context-aware GenAI JITAI System for Lifestyle Support in Type 2 Diabetes

Y. Zhang¹, H. Shi¹, N. Lu², P. Dempsey^{1,3}, J. Rawstorn¹, R. Daryabeygikhotbehsara¹, D. Dunstan^{1,3}, R. Maddison¹

¹Deakin University, Institute for Physical Activity and Nutrition, Geelong, Australia, ²Hong Kong Baptist University, Hong Kong, Hong Kong, SAR of China, ³Baker Heart and Diabetes Institute, Melbourne, Australia

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health
Room 4, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Lifestyle modification, comprising physical activity and healthy eating, is central to Type 2 diabetes (T2D) self-management, yet scalable and personalised guidance remains challenging. Advances in generative artificial intelligence (GenAI) offer opportunities to generate context-aware, real-time recommendations to support daily self-care. We evaluated our context-aware, GenAI-enabled just-in-time adaptive intervention (JITAI) system for lifestyle support in people with T2D by experimentally comparing the quality, personalisation, and guideline-concordance of GenAI-generated lifestyle recommendations with those provided by human experts.

Methods: Ten simulated T2D self-management scenarios for five personas were developed to represent common contexts (e.g., pre-meal planning, post-exercise recovery, sedentary alerts), yielding 50 contexts. For each context, two recommendations were generated, one by our JITAI system and one by an expert team (accredited dietitians and exercise physiologists). All recommendations (n=100) were de-identified, source-masked, and randomised. Another expert panel independently rated each item using an adapted Artificial Social Agent Quality Scale (ASAQ-S) covering five constructs: coherence, intentionality, believability, attentiveness, and actionability. Ratings used 5-point Likert scales (1 = poor to 5 = excellent). Mean domain scores and inter-rater reliability (Cohen's κ) were calculated.

Results: Inter-rater reliability was acceptable ($\kappa = 0.72$). On average, human recommendations received higher total ASAQ-S scores (4.3 ± 0.4) than GenAI outputs (3.8 ± 0.5). Our proposed system approached human performance levels for coherence (4.2 vs 4.3) and guideline-concordance (4.6 vs 4.7), with lower scores for personalisation (3.5 vs 4.6) and contextual appropriateness (3.7 vs 4.4). Approximately 80% of AI recommendations were rated "acceptable" (≥ 3.0), and raters did not identify material risk concerns in this pilot set. Qualitative comments indicated that AI advice was generally sound but sometimes generic, with limited tailoring for individual circumstances (e.g., comorbidities) and cultural food practices, particularly in more complex scenarios.

Conclusion: In simulated scenarios, our JITAI system for T2D self-management generated recommendations that were broadly aligned with expert guidance, demonstrating strengths in coherence and guideline-concordance and room for improvement in nuanced personalisation. These preliminary findings support the feasibility of GenAI systems as context-aware adjuncts to expert care. Future work will involve iterative refinement with end-users to evaluate usability, acceptability, and behavioural impact in real-world settings.

3 - Machine Learning Model Development for Glucose Prediction and Just-in-Time Adaptive Interventions

B. Lim¹, S.A. Bruce², D. Dey², C.D. Rethorst¹

¹Texas A&M Agrilife Research, Institute for Advancing Health Thru Agriculture, Dallas, United States, ²Texas A&M University, Department of Statistics, College Station, United States

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health
Room 4, May 28, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Glucose excursions (GEs), including postprandial spikes, are linked to cardiometabolic risks, even in non-diabetic individuals. GEs are more frequent in people with overweight or obesity, likely due to impaired regulation and greater glycemic variability. While prior research emphasized dietary and metabolic factors, the influence of real-world behavioral and physiological states on glucose dynamics remains unclear. This study developed a machine learning model using EMA, CGM, and Fitbit data to predict GEs and examine individual-level feature importance for tailored interventions.

Methods: Data were collected from 84 adults with overweight or obesity who wore CGM and Fitbit devices and completed EMA over 14 days. We developed a regression model to predict glucose levels at 15, 30, and 60 minutes, and a random forest classifier to predict GEs (≥ 1.5 SD above individual mean) within a 2-hour window, 1–3 hours ahead. Performance was evaluated using R^2 /MSE (regression) and accuracy/recall (prediction). SHAP values and hierarchical clustering were used to identify key predictors and behavioral subgroups.

Results: The regression model showed strong performance in predicting glucose levels: $R^2 = .92$ at 15 minutes (MAE = 3.72), .68 at 30 minutes, and .55 at 60 minutes. For GE prediction, accuracy was 0.65 and recall 0.52, supporting timely intervention. SHAP analysis revealed key predictors: recent activity intensity, time of day, prior glucose patterns, and momentary hunger. Hierarchical clustering identified three behavioral subgroups: (1) meal-time hunger with low glucose and hunger, (2) rising glucose in the late evening without hunger and (3) evening glucose stability with low activity and no hunger. Each cluster aligned with tailored messaging strategies for just-in-time adaptive interventions (JITAs) delivery.

Conclusion: Machine learning models integrating real-world behavioral, physiological, and glucose data can effectively predict short-term glucose patterns and GE risk. Identified behavioral subgroups offer actionable insights for message tailoring, supporting the development of precision JITAs to promote metabolic health in individuals with overweight or obesity.

O.1.05

8 - Evaluating and Refining CHIPS: An AI-powered Food Classification App for Enhancing Nutrition Literacy and Reducing Ultra-processed Food Intake

C. Zinn¹, J. Campbell¹, G. Schofield¹

¹Auckland University of Technology, Human Potential Centre, Auckland, New Zealand

O.1.05 E- & mHealth: AI, Machine Learning, and Advanced Methodologies in Digital Health

Room 4, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Excessive consumption of ultra-processed foods (UPFs) contributes substantially to the global metabolic disease burden. However, identifying UPFs can be challenging due to inconsistencies in existing classification systems. This work aimed to develop and evaluate an artificial intelligence (AI)-powered mobile application, originally based on a refined adaptation of the NOVA framework, termed the *Human Interference Scoring System* (HISS), and now rebranded as **CHIPS (Combining Health, Intuition, Processing and Science)**. CHIPS extends NOVA by integrating both food processing and health impact, recognising that some processed foods may confer positive health attributes. The app classifies foods using AI-driven image recognition, providing real-time visual feedback on dietary patterns. This research evaluated the accuracy, usability, and cultural relevance of CHIPS across diverse user groups in New Zealand.

Methods: In this mixed-methods study, thirty-one participants were recruited across three target groups: adolescents (n=13), tertiary students (n=8), and Māori/Pacific health coaches (n=9). Participants used the app for three days to log foods and beverages via photographs. Quantitative analyses assessed AI accuracy by comparing 203 user-submitted images with dietitian-verified classifications. Usability was measured through in-app metrics and a five-item Likert-scale survey. Qualitative data were collected via semi-structured focus groups and analysed inductively to identify key themes related to engagement, usability, and cultural responsiveness.

Results: CHIPS achieved 93% accuracy in food classification. Participants reported high usability (mean 4.4/5) and usefulness (4.5/5). Across groups, participants valued the app's visual simplicity, real-time feedback, and cultural inclusivity, which encouraged reflection on food choices and improved awareness of UPF intake. These features improved CHIPS' accessibility for users with lower nutrition literacy. Thematic analysis identified three categories: *Positive Experiences* (intuitive design, reliable AI, enhanced awareness, cultural inclusivity), *Challenges* (minor technical issues, limited depth for advanced users), and *Suggested Improvements* (expanded database, educational feedback, gamification, nutrient tracking).

Conclusion: CHIPS demonstrated strong accuracy, usability, and cultural relevance, supporting its potential as a scalable tool to improve nutrition literacy and reduce UPF intake. By refining and operationalising an adapted NOVA

ORAL ABSTRACT SESSIONS

model through AI, CHIPS offers an innovative approach to food classification and dietary behaviour change. The latest version of CHIPS will be demonstrated during the session.

O.1.06-1

Dietary Amino Acid Intake and Colorectal Cancer Risk in Seven European Countries: Results from the EPIC Prospective Cohort Study

J. Martínez-Gómez^{1,2}, I. Iguacel^{3,4,5}, S. Manohar², G. Nicolas², R. Fernández-Jiménez^{1,6,7}, I. Huybrechts²

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities
Room 5, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Colorectal cancer (CRC) often develops asymptotically and is largely preventable through lifestyle modification and early detection strategies, emphasizing the importance of identifying key modifiable risk factors. Emerging evidence suggests that circulating and dietary amino acids (AAs) may influence CRC risk; however, data remain limited, with inconclusive findings. We aimed to investigate how dietary AAs intake is associated with subsequent CRC risk in a European population.

Methods: Associations between dietary AAs intake and CRC risk were examined among 367,463 adults from seven European countries participating in the European Prospective Investigation into Cancer and Nutrition (EPIC) cohort, all free of cancer at baseline. Dietary intake of 18 AAs was assessed at recruitment using validated, country-specific dietary questionnaires. AAs intake (grams/day) was standardized by multiplying by 1,000 and dividing by body weight (in kilograms). AAs were grouped into essential (n=9; histidine, isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan, and valine), non-essential/conditionally essential (n=9; alanine, arginine, aspartic acid, cysteine, glutamic acid, glycine, proline, serine, and tyrosine), and total (n=18). Participants were classified into sex-specific quartiles according to their intake levels for each AAs group. Associations between AAs intake and incident CRC were evaluated using multivariable Cox proportional hazards models to estimate hazard ratios (HRs) and 95% confidence intervals (CIs). Models were adjusted for educational level, body mass index, total energy intake, smoking status, diabetes, physical activity, height, and alcohol, red, and processed meat consumption.

Results: During a median follow-up of 13.9 (SD=3.8) years, 4,918 participants were diagnosed with CRC. In multivariable-adjusted models, higher total dietary AAs intake was inversely associated with CRC risk when comparing the highest versus lowest quartiles [HR (95% CI): 0.85 (0.73–0.97); *p*-value= 0.019]. The association was stronger and statistically significant for non-essential/conditionally essential AAs [HR (95% CI): 0.84 (0.73–0.97); *p*-value = 0.017], while a weaker and borderline association was observed for essential AAs [HR (95% CI): 0.88 (0.77–1.01); *p*-value = 0.071].

Conclusion: Higher dietary AAs intake was associated with a lower risk of CRC, with stronger associations observed for non-essential/conditionally essential AAs. Further research is needed to elucidate the biological mechanisms and molecular pathways underlying these associations.

Temporal Trends of Physical Behavior Patterns and Socio-demographic Correlates in Germany between 2014 and 2023

B. Wallmann-Sperlich¹, C. Lendt², J. Bucksch³, M. Leitzmann², I. Froboese⁴

¹Julius-Maximilians-University Wuerzburg, Integrative & Experimental Exercise Science and Training, Institute of Sport Science, Faculty of Human Science, Wuerzburg, Germany, ²University of Regensburg, Department of Epidemiology and Preventive Medicine, Regensburg, Germany, ³Heidelberg University of Education, Department of Prevention and Health Promotion, Heidelberg, Germany, ⁴German Sport University Cologne, Institute of Movement Therapy and Movement-oriented Prevention and Rehabilitation, Cologne, Germany

ORAL ABSTRACT SESSIONS

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities Room 5, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: High sedentary time and physical inactivity are linked to adverse health outcomes, with evidence showing that very high levels of moderate- to vigorous-intensity physical activity (PA) can offset some of the risks associated with prolonged sitting. Monitoring population trends in combined physical behavior is essential for understanding changing risk patterns and guiding interventions. This study therefore examined the temporal trends and their sociodemographic correlates of different physical behavior patterns among adults in Germany between 2014 and 2023.

Methods: Data were obtained from five cross-sectional, population-representative telephone surveys conducted in Germany in 2014, 2016, 2018, 2021, and 2023, comprising a total of $N = 14,417$ adults aged ≥ 18 years. Participants completed the Global Physical Activity Questionnaire and the Marshall Sitting Questionnaire. Participants were classified into four physical behavior profiles based on sitting time ($<$ or > 8 hours/weekday) and PA level ($<$ or > 600 MET-minutes/week). Descriptive statistics and logistic regression analyses examined temporal trends and their sociodemographic and health-related correlates of physical behavior profiles.

Results: The proportion of adults with high sitting time (> 8 h/weekday) and insufficient PA (< 600 MET-min/week) increased from 5.3% (4.4-6.4%) in 2014 to 8.8% (7.4- 10.4%) in 2023, peaking at 10.5% in 2021 (9.0-12.2%). The share reporting high sitting with higher PA (> 600 MET-min/week) increased from 36.9% (34.7-39.1%) to 46.8% (44.2-49.4%), while the proportion with low sitting and higher PA declined from 50.3% (48.0-52.5%) to 37.4% (35.0-39.9%). Over time, the likelihood of belonging to the low sitting/high PA group decreased (OR = 0.94, 95% CI: 0.92–0.95, $p < .001$), while odds for high sitting profiles increased (high sitting/low PA: OR = 1.06, 95% CI: 1.03–1.09, $p < .001$; high sitting/high PA: OR = 1.06, 95% CI: 1.04–1.08, $p < .001$). Men, younger age, higher education, higher income, and urban residence were associated with high sitting/high PA patterns. In contrast, higher BMI was associated with high sitting and low PA.

Conclusion: Population trends show an increase in sitting time, even among active adults, and a decline in the optimal low-sitting/high-activity profile. These findings highlight the need to target sedentary behavior as a public health priority.

O.1.06-3

Participatory Design and Implementation of School-based Healthy Habits Interventions in Chile: Experience from Reactiva Tu Escuela

N. Aguilar-Farias^{1,2}, C. Mella-Garcia^{1,2}, S. Miranda-Marquez^{1,2}

¹Universidad de La Frontera, Department of Physical Education, Sports and Recreation, Temuco, Chile, ²UFRO Activate Research Group, Department of Physical Education, Sports and Recreation, Temuco, Chile

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities Room 5, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: The Reactiva Tu Escuela project aimed to promote healthy eating and physical activity habits in educational communities in Temuco, Chile, through a child-centered participatory approach. This study examines the participatory design and implementation experience, focusing on two specific objectives: improving skills, capabilities, and practices of educational communities at individual, family, and organizational levels; and creating and adapting school and community environments that promote healthy habits.

Methods: Reactiva Tu Escuela was implemented in 2023 across six schools. The project established representative committees (7-22 members) comprising students, families, teachers, and administrators. Participatory methodologies (i.e., photovoice, flowcharts, reflective analysis) facilitated collaborative situational diagnoses across 7-8 committee meetings per school. Each committee identified context-specific barriers, prioritized problems, and co-designed tailored action plans addressing both capacity-building and environmental adaptation requirements. The research team delivered customized interventions, including skill-building and educational sessions in physical activity and healthy eating, and infrastructure improvements. Outcomes were assessed through attendance records, satisfaction surveys, accelerometry, and qualitative evaluations from students, families, and school staff.

Results: Each school successfully designed unique intervention portfolios. Across six schools, 132 skill-building and educational sessions in physical activity and healthy eating were implemented, comprising workshops in emerging sports, circus arts, healthy eating, and school gardens, which reached 700 children and involved their families. Physical activity sessions totaled 85 (1,132 participants); healthy eating sessions comprised 47 sessions (157 participants). Environmental adaptations included infrastructure improvements and optimization of physical spaces

ORAL ABSTRACT SESSIONS

based on photovoice diagnoses. Accelerometry revealed increases of 23-34% in moderate-to-vigorous physical activity during recess. Workshops enabling food preparation received the highest ratings. Communities valued that student-identified environmental and capacity needs differed from the assumptions of adults. Implementation challenges included staff workload, delayed starts, and limited duration, constraining deeper capacity development and environmental changes.

Conclusion: This experience shows that participatory co-design successfully generates contextually appropriate interventions addressing physical inactivity and unhealthy eating across diverse school settings. Meaningful child participation enhanced relevance by identifying environmental barriers and capacity gaps adults overlooked. This experience offers a replicable framework for developing locally relevant interventions that simultaneously strengthen community capabilities and transform school environments, prioritizing participatory processes over standardized approaches.

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities
Room 5, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Sustained engagement is a critical implementation challenge for community-based physical activity programs, particularly when scaled beyond pilot settings. This study examined participant characteristics associated with early retention in the Unidad Activa de Ejercicio Físico (UAEF), a region-wide exercise referral program in Castilla-La Mancha (Spain). We identified sociodemographic, clinical, and functional-fitness predictors of continuation after the initial assessment, providing practice-based evidence to guide implementation strategies and inform scalable models of exercise referral.

Methods: We analysed baseline data from 827 UAEF participants (73.6% women; 13 municipalities). The implementation outcome was early retention (completing ≥ 1 follow-up visit vs. dropout after baseline). Measures included demographics, province, BMI, health-related quality of life (EQ-5D-3L, VAS), categorized chronic conditions, and functional fitness (SPPB, 5-times sit-to-stand, sit-and-reach, 6-min walk test, resting heart rate). Analyses used chi-square tests, risk ratios, odds ratios, t-tests, and effect sizes to identify predictors relevant to program adoption/continuation at scale.

Results: Overall, 54.8% of participants completed at least one follow-up visit. Retention differed significantly by sex (men 61.5% vs. women 52.4%; OR = 1.45, $p = .021$) and province ($p < .001$), with dropout highest in Toledo (61.6%) and lowest in Cuenca (6.1%), indicating strong contextual variation. Higher BMI (specifically Obesity I/II) was associated with greater retention ($p = .0047$). Participants who remained showed better baseline functional fitness (SPPB total score; 8.20 vs 6.39; $p < .001$; (Sit and Reach; 25.12 vs 20.39; $p = .001$) and lower overall perceived health (VAS scale; 67.7 vs 71.4; $p = .003$). Moreover, clinical needs was also a key retention factor, retention was significantly higher among participants reporting chronic pain (61.6% vs 50.9%; $p = .003$), respiratory or sleep conditions (70.8% vs 53.8%; $p = .021$), and moderate/severe mobility limitations (EQ-5D-3L; $p = .019$).

Conclusion: Sex, province, BMI, functional status, and specific clinical needs predicted early retention. Tailored engagement strategies are needed, particularly supporting women and addressing provincial inequities. UAEF seems to be a good strategy for those sedentary people with lower perceived quality of life, with obesity and clinical needs. Therefore, UAEF are highly recommended.

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities
Room 5, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Around 20 percent of Australian children attend Outside School Hours Care (OSHC), yet this setting is often overlooked in efforts to improve children's physical activity and reduce recreational screen time. Although national OSHC guidelines exist, practice varies widely and many services struggle to implement and sustain evidence-based approaches.

This study examined the effectiveness of the Activated OSHC program in:

- i) increasing the proportion of OSHC services meeting the national OSHC physical activity and screen time guidelines;
- ii) improving children's physical activity and recreational screen time during OSHC; and
- iii) increasing staff behaviours that promote physical activity.

Methods: The Activated OSHC program includes staff training, development of a physical activity and screen time policy, family communication materials, posters and accreditation resources. We conducted a Type 2 hybrid effectiveness-implementation RCT to evaluate the program across 197 OSHC services in Australia, randomised 1:1 to intervention or control, with 12 month follow-up. Primary outcomes were the proportion of services meeting all four guideline components. Effectiveness outcomes were children's moderate-to-vigorous physical activity (MVPA), recreational screen time and staff enabling behaviours, measured through coordinator surveys and SOPLAY/SOSPAN observations. Intention-to-treat analyses used mixed-effects logistic and negative binomial models, with per protocol sensitivity analyses.

Results: 182 OSHC services were retained at 12-months (92%). Intention-to-treat analyses showed no significant differences for guideline adherence or children's behaviour, although staff enabling behaviours were higher in the intervention group at 12 months. Per protocol analyses showed clearer effects among services that completed Activated OSHC accreditation: at 12 months, they were seven times more likely than controls to meet guidelines (OR 7.35; 95%CI 1.39 to 38.86; $p = 0.019$); children's MVPA increased (IRR 1.23; 95%CI 1.05 to 1.43; $p = 0.010$), screen-device availability was lower OR = 0.82, 95% CI = 0.68, 0.99; $p = 0.037$), and staff enabling behaviours trebled (OR 3.00; 95%CI 2.10 to 4.28; $p < 0.001$).

Conclusion: The Activated OSHC program showed clear benefits when implemented as intended. As the largest after-school physical activity trial internationally, this study demonstrates the value of structured policy and training support. Further work is needed to strengthen implementation and sustainment.

O.1.06-6

Key Events in the Implementation Process of an Adaptable Intervention Approach in the ECEC Setting: A Case Study of SuperFIT

L. Harms¹, N. Bartelink¹, K. Beckers¹, J. Gubbels¹, S. Gerards¹

¹Maastricht University, Health Promotion, Maastricht, Netherlands

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities
Room 5, May 28, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Implementing multi-component interventions is complex because context-sensitivity and adaptability are required. It is important to highlight whether implementation challenges arise from the intervention itself (*the thing*) or from the strategies required for effective implementation (*the stuff*). This study aimed to identify barriers and facilitators for the implementation of the SuperFIT approach, from the implementers' perspective, to develop strategies to support implementers and to identify key events in the implementation process.

Methods: A case study design with an action-oriented approach was used. The study was underpinned by the CFIR implementation framework. SuperFIT, which promotes energy-balance related behaviours in 2–4-year-olds, is primarily implemented in early childhood education and care (ECEC) settings. Data were collected through semi-structured interviews (n=20), focus groups (three sessions, total n=6), meeting notes and a timeline session (n=6). Participants included the implementers (i.e., the SuperFIT coach) as well as operational and management stakeholders.

Results: Facilitating characteristics of a SuperFIT coach were enthusiasm, the ability to listen, and empathy. However, coaches themselves struggled to deal with the resistance they encountered and not all believed to have the necessary knowledge or skills. Within the inner setting, willingness and resources to implement SuperFIT were facilitators. Partnerships or collaborations within the outer setting were rarely mentioned as facilitator. Furthermore, adaptability of the intervention (*the thing*) was mentioned as both a facilitator and a barrier. Coaches were positive about the ongoing development of the intervention as a whole. Focus groups emphasised this finding and identified the use of local consensus discussions, training of implementers, development of educational materials and monitoring implementation progress as successful implementation strategies (*the stuff*) used over time. Interestingly, the support that the coaches received from within and outside their organisation (*the stuff*) was rarely identified as a key event. Instead, unanticipated challenges were mentioned more often and served as a prompt to take action.

Conclusion: Adopting the implementer's perspective provides valuable insights into whether improvements are needed in the intervention (*the thing*) or implementation strategies on multiple levels (*the stuff*). Implementing an adaptable intervention requires higher level skills, and recognising or taking ownership of this process takes time.

O.1.06-7

Physical Activity Promotion in Outpatient Hospital Care: Implementation Strategies Delivered in the PROMOTE-PA Study

K. Purcell¹, J. Baldwin¹, B. Wang¹, M. De Barros Pinheiro¹, P. Phongsavan², B. Smith², A. Tiedemann¹, L. Hassett³, A. Haynes¹, C. Sherrington¹, J. Dawson⁴

¹The University of Sydney, Institute for Musculoskeletal Health, Sydney, Australia, ²The University of Sydney, Prevention Research Collaboration, Sydney, Australia, ³The University of Sydney, School of Health Sciences, Sydney, Australia, ⁴The University of Sydney, Research Physiotherapist, Sydney, Australia

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities
Room 5, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: PROMOTE-PA is a hybrid type I effectiveness-implementation cluster randomised controlled trial evaluating implementation support for health professionals to promote physical activity (PA) within clinical practice. This abstract reports on adoption, dose, reach and acceptability of implementation support provided.

Methods: Four implementation strategies were co-designed with health professionals in PROMOTE-PA Part I - 1) education and training, 2) community PA referral, 3) experts and mentors and 4) system and local champions. Clinical teams were randomised to receive support immediately (intervention) or after recruiting patients (control). Teams could select preferred implementation strategies. Measures of implementation strategy adoption, dose and reach were collected in the intervention group through routine monitoring and program implementation data. Acceptability data were collected using a 5-point Likert scale.

Results: Thirty clinical teams (n=156 health professionals) were recruited from 17 hospitals and four physiotherapy practices in Sydney, Australia. Most health professionals were female (75%) and most were physiotherapists (75%). Fourteen clinical teams were randomised to intervention and 16 to control. Data are available for 10 intervention teams (n=50 health professionals).

All 10 teams received education and training through the learning hub, the community PA directory, community PA referral pathways and clinical mentors. A health coaching service (9 teams), transition to exercise programs (3 teams) and clinical champions (2 teams) were also utilised.

Implementation adoption –Eighty-five teams were approached and 30 (35%) recruited. Implementation dose-implementation support averaged 4 sessions and 9.6 hours of direct support. Implementation reach was broad with

ORAL ABSTRACT SESSIONS

11 musculoskeletal teams, 4 cardiopulmonary, 6 geriatric, 3 paediatric, 3 neurological, 2 medical clinics and 1 pain team recruited. Acceptability scale was completed by 38 out of 50 (76%) health professionals. Most, 82% agreed/strongly agreed that implementation support improved their knowledge about how to have PA conversations with patients, 79% agreed/strongly agreed it had given them skills to have a conversation about PA and 79% agreed/strongly agreed it made it easier to identify PA opportunities.

Conclusion: Tailored approaches to support PA promotion within clinical care are acceptable to health professionals. Co-designed implementation strategies can be adapted to different clinical contexts and patient populations.

O.1.06 Implementation and scalability: Implementation Science in Practice: Strategies for Schools and Communities
Room 5, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Sustaining delivery of school-based physical activity programs once implementation support ends is a major challenge. This study aimed to assess whether a multi-strategy intervention sustained teachers' scheduling of classroom energisers (brief bouts of physical activity) and their adherence to a mandatory physical activity policy.

Methods: Following a 12-month implementation intervention, we conducted a cluster randomised controlled trial with 25 primary schools (12 intervention, 13 control) in New South Wales, Australia. Intervention schools received a 12-month package of sustainment strategies targeting both organisational and teacher levels. These included centralised technical assistance, principal endorsement, champion preparation, teacher reminders, educational resources and parent communication. Teachers completed daily logbooks recording the scheduling of energisers, physical education, sport, and integrated lessons at baseline and 12 months. The primary outcome was mean daily minutes of energisers; secondary outcomes were total weekly minutes of physical activity and adherence to the 150-minute mandatory policy. We used mixed-effects linear and logistic regression models to account for clustering by school.

Results: There was a statistically significant difference between intervention and control schools in the mean change from baseline to 12 months in teachers' scheduling of daily energisers, with intervention schools increasing by approx. 6 minutes per day (95% CI: 3.15 to 8.82; $p < 0.001$). Intervention schools also recorded a greater increase in total weekly minutes of scheduled physical activity by approx 35 minutes (95% CI: 13.35 to 57.65; $p = 0.002$). More teachers in the intervention group met the 150-minutes-per-week policy requirement (OR 9.56; 95% CI: 1.96 to 46.57; $p = 0.005$). No significant effects were observed for physical education, sport, or integrated lessons.

Conclusion: This is the first randomised controlled trial to test strategies specifically designed to sustain teacher-led classroom physical activity. Low-intensity strategies sustained teachers' scheduling of energisers and improved compliance with the school physical activity policy at 12 months. A 24-month follow-up will assess longer-term effects on delivery and policy adherence.

ORAL ABSTRACT SESSIONS

O.1.07 Systems Science: Leveraging Nutrition Systems: From Policy to Population Health

Room 6, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: South Africa is experiencing a double burden of malnutrition (DBM), the coexistence of underweight, micronutrient deficiencies, and overweight/obesity. The DBM stems from complex interactions among individuals, food environments, and the broader socio-economic landscape. To explore these dynamics and understand shared drivers of undernutrition and overweight, we used group model building with multi-sectoral stakeholders in Cape Town, South Africa, to develop a causal loop diagram mapping the drivers of the DBM at individual, household (micro-), and community and local policy (meso-) levels.

Methods: We conducted 35 in-depth interviews with stakeholders representing the micro-level (community health workers and their coordinators) and meso-level (researchers, civil society representatives, and city and provincial government employees) to develop a preliminary list of drivers of the DBM. This data formed the basis for our group model building workshops, with two workshops each at micro- (n=13) and meso-level (n=8).

Results: Two causal loop diagrams were developed with stakeholders and then iteratively refined and merged into one model by the research team. The model contains eight central themes: food environment domains, access to resources, policy development, social and equity awareness, governance principles, commercial determinants of health, barriers to food security, and interpersonal relationships. At the micro-level, stakeholders recommended leverage points focused on strengthening food and nutrition literacy of community health workers and advocacy to limit alcohol sales in townships; increase food safety inspections at informal shops, and increase access to food gardens. At meso-level, leverage points included: mobilizing civil society, supporting evidence uptake in agenda setting, enable a healthier food environment through updated zoning laws, increasing transparency in interaction with the corporate sector, and regulating unhealthy food marketing.

Conclusion: A participatory approach is valuable to understanding the complex dynamics driving the DBM in Cape Town and to recommending double-duty actions across socioecological levels that address both undernutrition and overweight.

O.1.07-2

Unpacking the Impact of the Birmingham Food System Strategy: Insights from a Ripple Effect Mapping Study

F. ter Ellen¹, K. Parsons², M. White², A. Sawyer²

¹Erasmus MC, Department of Public Health, Rotterdam, Netherlands, ²University of Cambridge, MRC Epidemiology Unit, Cambridge, United Kingdom

O.1.07 Systems Science: Leveraging Nutrition Systems: From Policy to Population Health

Room 6, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: An increasing number of cities worldwide have adopted formal food strategies to transform urban food systems. Birmingham's Food System Strategy (2022–2030) aims to create a “sustainable, healthy, and thriving” food system. Emerging from three years of collaboration with local stakeholders, the strategy adopts a whole-systems approach and is coordinated by the Council's Food System (FS) Team. This study explored the perceived impacts of the strategy and identified key mechanisms that have enabled or constrained progress so far.

Methods: We employed Ripple Effect Mapping (REM), a participatory qualitative evaluation method designed to capture intended and unintended outcomes within complex systems. Data were collected through five REM workshops with six FS Team members and eight stakeholders active in the delivery of the strategy (e.g. from third sector, food retail, research). Impacts were mapped along a timeline, grouped into impact pathways, and thematically analysed to identify clusters of impacts and enabling mechanisms.

Results: From the stakeholder perspective, 17 impacts and enabling mechanisms were identified, grouped into two clusters: 1) How co-production helped shape an inclusive strategy, even though some stakeholders felt overlooked, 2) How the strategy's funding and support mechanisms enabled stakeholder-led action and fostered a wider movement, within a context of financial precarity.

From the FS Team perspective, 26 impacts and mechanisms were grouped into four clusters: 1) How the Team built legitimacy and fostered collaboration, 2) How funding supported stakeholder action but also increased dependency on municipal support, 3) How procurement became a systemic lever for change and 4) How the Team navigated emotional strain and institutional barriers while building institutional memory and research-policy partnerships.

Conclusion: The findings show how co-production and the dedicated coordination role of the FS Team strengthened inclusivity and legitimacy of the strategy. Funding streams mobilised local initiatives but also revealed the fragility of

ORAL ABSTRACT SESSIONS

short-term resources. Procurement emerged as a powerful institutional lever, while the Team's bridging role fostered collaboration and trust yet generated emotional strain. Future strategies should prioritise stable coordination for implementation, secure long-term funding, and embed continuous learning to enable sustained transformation of urban food systems.

O.1.07-3

Coordinating the Governance of Food and Nutrition Surveillance Systems in Canada: A Mixed Methods Network Analysis

K. Lee¹, D. Zaman¹, T. Penney¹

¹York University, School of Global Health, Toronto, Canada

O.1.07 Systems Science: Leveraging Nutrition Systems: From Policy to Population Health
Room 6, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Policy- and decision-makers have conventionally used food and nutrition surveillance data and indicators (e.g., fruit and vegetable consumption) to inform policy. However, complex structural pressures of the food system are driving the need for surveillance systems to be highly coordinated across sectors to better monitor health, climate, and equity drivers of the food system. To inform a coordinated governance approach to surveillance, there is a need to understand who is engaged in the surveillance process, how surveillance actors are connected, and potential facilitators and barriers for collective action.

Methods: A mixed methods network analysis was conducted to examine the system of institutional actors involved in food and nutrition surveillance in Canada. Participants were recruited through a purposive sampling strategy and include representatives of organizations and institutions that engage in surveillance of health-, climate-, or equity-related drivers of the food systems. Quantitative surveys mapped the structure of the network, where participants were asked which organizations they conduct surveillance activities with and how often. Centrality was used to identify highly connected organizations within the network. Qualitative interviews provided a deeper understanding of the functions and processes that underly the structure of the network, including efforts to coordinate surveillance across sectors.

Results: The Canadian food and nutrition surveillance network is diverse, including a range of actors from government and non-government organizations, research institutions, academic networks, and industry. Organizations spanned health, nutrition, environment, food and agriculture, social justice, and trade sectors. Participants emphasized collaborative and collective action is essential to understand the inter-sectoral nature of food systems, including how indicators from different surveillance systems can be linked. Strategies for inter-sectoral coordination of surveillance activities are needed to help minimize duplication of resources for data collection and analysis. Barriers include conflicting mandates and agendas, funding for data collection, and data access.

Conclusion: A systems-informed evaluation of the network of surveillance actors is essential for understanding how governance processes and structures can be improved to better inform policy for food systems. This study will contribute to a series of reports with practical, sector-specific strategies for a coordinated approach to surveillance of food and nutrition systems.

O.1.07-4

Reflections on a Collaborative Interdisciplinary Systems Approach to Urban Food Transformation: The Mandala Research Consortium

A. Sawyer¹, K. Parsons¹, J. Adams¹, S. Mantravadi², S. Cummins³, M. White¹

¹University of Cambridge, IMS Epidemiology Unit, Cambridge, United Kingdom, ²University of Cambridge, Department of Engineering, Cambridge, United Kingdom, ³London School of Hygiene and Tropical Medicine, Department of Public Health, Environments and Society, London, United Kingdom

O.1.07 Systems Science: Leveraging Nutrition Systems: From Policy to Population Health
Room 6, May 28, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: The urgency to transform food systems intensifies as externalised health, environmental and societal costs mount. However, the complex, systemic nature of food systems makes them notoriously difficult to change. The Mandala research consortium offers a case study of how interdisciplinary science, systems thinking and stakeholder collaboration can be integrated as a coherent research approach to identifying and developing interventions capable of instigating sustainable food system change. Using an established conceptual framework examining the ‘conditions’ for interdisciplinary collaboration, this paper identifies the challenges and opportunities of combining these three methodological principles.

Methods: Freeth and Caniglia’s (2020) framework was used to interrogate the case study and reflect on the challenges and opportunities of its methodological approach across two research phases: (1) Understanding the urban food system in Birmingham, UK, and identifying places to intervene; (2) Envisioning and prioritising food system interventions. Reflections were organised across epistemic, social, symbolic, spatial and temporal dimensions and considered whether the case study achieved ‘integrative interdisciplinarity’ or ‘additive multidisciplinary’.

Results: A complex systems approach enabled identification of food system interventions, overcoming epistemic differences inherent in interdisciplinary teams and epistemic, social, spatial and temporal challenges which varied across stakeholder groups. Interdisciplinary science and stakeholder collaboration provided opportunities to work across the full breadth of an urban food system. However, ‘integrative interdisciplinarity’ was not achieved in every aspect of the research.

Progress towards a collaborative interdisciplinary systems approach was supported by the tailoring of the research process to accommodate different stakeholder groups; the development of written internal guidance to support stakeholder collaboration and systems thinking; a pluralistic approach to data collection and evidence synthesis; and a pluralistic approach to evidence generation to incorporate modelling as well as evaluation.

Conclusion: A collaborative interdisciplinary systems approach to urban food system transformation was articulated using the Mandala consortium as a real-world case study. While identified opportunities support the funding and design of research using a similar methodological approach, we also documented challenges. We suggest practical solutions for researchers and funders to overcome these challenges.

Increasing Knowledge and Engagement for Policy, Practice and Environmental Change to Promote Child Health Equity: Results from Seven Catalyzing Communities Sites across the US

L. Calancie¹, T. Moore¹, K. Chui², P. Bakun¹, E. Hennessy¹, Y. Chang Chusan¹, C. Economos¹

¹Tufts University, Friedman School of Nutrition Science and Policy, Boston, United States, ²Tufts University, Department of Public Health and Community Medicine, School of Medicine, Boston, United States

O.1.07 Systems Science: Leveraging Nutrition Systems: From Policy to Population Health
Room 6, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Childhood obesity remains a major public health issue rooted in systemic inequities. Whole-of-community interventions that engage diverse partners in coalitions are a promising approach to prevention by impacting policy, practice, and environments (PPE). The Catalyzing Communities Initiative is a multi-site trial that deploys the Stakeholder-Driven Community Diffusion (SDCD) theory-informed participatory systems modeling intervention with coalition members to drive PPE change. This study evaluates changes in knowledge and engagement among participants across seven study sites.

Methods: Longitudinal survey data were collected from 363 stakeholders across seven US communities between 2019 and 2024. Participants were classified as coalition committee members who were directly involved in the intervention (n = 97), or community members (n = 266) within a committee member’s social networks. Knowledge and engagement were measured at baseline, mid-point, and follow-up using the validated SDCD Survey. The two domain scores were averaged (ranging 0–1) and then analyzed with mixed effects regression models to assess changes over time, adjusting for demographic variables and clustering by individual within communities.

Results: Knowledge scores increased significantly overall (+0.047 at mid-point, +0.067 at follow-up; scale: 0-1; p < 0.01), with larger gains among coalition committee members (+0.096 at mid-point and +0.118 at follow-up; p < 0.01). The largest improvements were in domains related to knowledge of intervention strategies, roles and resources, and implementation and sustainability; knowledge of the problem rose more modestly. Engagement increased modestly overall (+0.029 and +0.022; p < 0.05), driven by coalition committee members (+0.057 and +0.063; p < 0.01), particularly in leadership and stewardship, influence and power, and dialogue and mutual learning. Community members

ORAL ABSTRACT SESSIONS

showed minimal change in knowledge and a significant decline in engagement. Among committee members, more years of professional experience was associated with larger gains in knowledge and engagement; no moderation was observed by sector affiliation or demographics.

Conclusion: The Catalyzing Communities Initiative can significantly increase stakeholder knowledge and engagement among intervention participants. Domain-specific gains highlight which aspects of knowledge and engagement may be most responsive to the intervention. These findings underscore the potential of whole-of-community interventions to build foundational capacities in community leaders for systems-level child obesity prevention.

O.1.07-6

Sex-specific Associations of Ultra-processed Food Consumption with Metabolic Syndrome among Adults in Korea: Evidence from the Prospective Health Examinees Cohort

W. Khaing¹, J. Hwang¹, S. Shin¹

O.1.07 Systems Science: Leveraging Nutrition Systems: From Policy to Population Health
Room 6, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Emerging evidence suggests that ultra-processed food (UPF) intake may increase cardiometabolic risk, but sex-specific evidence in Asian populations remains limited. This study aimed to examine sex-specific associations between UPF consumption and the risk of metabolic syndrome (MetS) among Korean adults using data from a large-scale prospective cohort.

Methods: A total of 46,945 adults (15,225 men and 31,720 women) aged 40–69 years from the Health Examinees (HEXA) study were included. Dietary intake was assessed using a validated 106-item food frequency questionnaire, and foods were categorized according to the NOVA classification. Incident MetS was defined by the modified National Cholesterol Education Program Adult Treatment Panel III criteria. Cox proportional hazards regression models estimated hazard ratios (HRs) and 95% confidence intervals (CIs) for MetS and its components across quartiles of UPF consumption. Models were adjusted for sociodemographic, lifestyle, and health-related covariates; in women, additional reproductive factors (parity, age at first birth, menopausal status, age at menopause, and age at menarche) were included to account for hormonal influences.

Results: During follow-up, higher UPF consumption was positively associated with the risk of MetS and its components. Compared with the lowest quartile (Q1), participants in the highest quartile (Q4) had higher risks of central obesity (HR: 1.27; 95% CI: 1.20–1.33), elevated blood pressure (HR: 1.23; 95% CI: 1.16–1.29), elevated triglycerides (HR: 1.14; 95% CI: 1.07–1.22), and MetS (HR: 1.20; 95% CI: 1.11–1.29; all p-trend <0.0001). Associations were evident in both sexes but were more pronounced among women, who showed stronger relationships for central obesity, blood pressure, and triglycerides even after accounting for reproductive and hormonal factors.

Conclusion: Higher UPF intake was prospectively associated with an increased risk of metabolic syndrome among Korean adults, with women exhibiting greater vulnerability than men. These sex-specific differences suggest that biological and behavioral factors may contribute to differential susceptibility to the metabolic effects of ultra-processed foods. Public health interventions should consider sex-specific strategies to mitigate the growing metabolic burden associated with UPF consumption.

Thriving Teens: A Whole Systems Approach to Benefit Preadolescent Mental Wellbeing in Amsterdam

E. Meuleman¹, V. Busch², W. Waterlander³, N. van der Poel¹, C. Renders¹, M. van Stralen¹

¹Vrije Universiteit Amsterdam, Health Sciences, Amsterdam, Netherlands, ²GGD Amsterdam, Amsterdam, Netherlands,

³Amsterdam UMC, Amsterdam, Netherlands

O.1.07 Systems Science: Leveraging Nutrition Systems: From Policy to Population Health
Room 6, May 28, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: “If many children are struggling with the same issues and falling outside the ‘normal’ system, we need to examine the circumstances and structures in which they grow up—rather than focusing solely on the child.” This statement by Amsterdam’s Alderman Moorman reflects a growing movement in public health to apply systems thinking to complex societal challenges. The Thriving Teens project builds on this approach to uncover how interrelated factors—the *system dynamics*—shape preadolescent mental wellbeing. The goal is to provide a foundation for developing integrated, context-specific actions and driving system change across three Amsterdam neighbourhoods.

Methods: A causal loop diagram (CLD) was iteratively developed by integrating scientific and community-based insights. The scientific base drew on an umbrella review of 143 systematic reviews and seven focus groups with scientific experts (N=18). This was expanded with lived experiences from preadolescents (N=233), caretakers (N=83), and professionals (N=56), collected through a co-created conversational tool (“The Tree”) and semi-structured interviews. The resulting multi-actor CLD—comprising 62 factors, 50 feedback loops, and 11 subsystems—was analysed using system archetypes to reveal recurring behavioural patterns that sustain or hinder wellbeing.

Results: The analysis revealed interconnected dynamics ranging from livelihood insecurity and parental headspace to social comparison, performance pressure, and the 24/7 online norm. Eleven subsystems—including *Always online*, *Increasing pressure*, *Parenting challenges*, and *Lost in the system*—capture how social norms, institutional structures, and local contexts interact to influence wellbeing.

Seven system archetypes were identified, such as *Fixes that Fail* (short-term poverty relief creating long-term complexity) and *Success to the Successful* (resource-rich schools advancing faster than underresourced ones). These archetypes illustrate how well-intentioned policies can reinforce, rather than resolve, underlying inequalities.

Conclusion: Understanding both the structure (how factors connect) and the behaviour (how the system acts over time) of preadolescent mental wellbeing highlights that there are no simple fixes. Instead, effective strategies require multi-level, preventive, and equity-oriented approaches that disrupt reinforcing patterns—such as fragmented policies or societal norms around individualism and 24/7 connectivity—and strengthen supportive environments for children to thrive.

O.1.08-1

Testing the Physical Activity Transition Model among Children and Adolescents in Low- and Middle-income Countries: A Systematic Review and Meta-analysis

P.K. Akwaboah¹, A. Pierson¹, K. Obrutu¹, R.H.A. Mahdi¹, A. Oyeyemi², R. Larouche¹

¹University of Lethbridge, Faculty of Health Sciences, Lethbridge, Alberta, Canada, ²Arizona State University, College of Health Solutions, Phoenix, United States

O.1.08 Children & Families: Youth Movement Behaviors and Health Outcomes: From Measurement to Intervention
Room 7, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: The Physical Activity Transition model suggests that urbanization and economic growth lead to decreased physical activity (PA) levels, especially in urban areas. Currently, low- and middle-income countries (LMICs) are urbanizing rapidly, which can influence PA levels. However, existing evidence is based on individual country studies, limiting broad conclusions about the PA transition. This systematic review summarizes current research on the PA transition among children and adolescents in LMICs.

Methods: Two independent reviewers screened 5,147 potentially relevant articles from six databases. Data were extracted from 84 studies across 29 LMICs, involving 530,908 participants aged between 3 and 19 years. Study quality was assessed using the AXIS and JBI tools. The GRADE approach was used to evaluate the quality of the evidence. Data were synthesized narratively or meta-analyzed where appropriate. Meta-analyses compared device-based moderate-to-vigorous physical activity (MVPA) estimates between urban and rural participants, further stratified by World Bank income classification, continent, and age group.

Results: Overall, 68% of significant differences in PA levels favored rural participants, while 32% favored urban participants. The main meta-analysis indicated that, on average, children in urban areas accumulated ten fewer minutes of MVPA daily compared to those in rural areas, representing about one-sixth of the WHO PA guidelines. Stratified analyses revealed that children and adolescents in urban areas of low-income countries, (MD = -16.08, 95% CI: -31.69, -0.47) lower-middle income countries (MD = -9.48, 95% CI: -17.28, -1.67), Africa (MD = -12.29, 95% CI: -21.77, -3.94) and the Americas (MD = -8.45, 95% CI: -11.24, -5.65), accumulated fewer MVPA minutes per day than their rural counterparts. Lower PA levels in urban areas were also observed for those <6 years (MD = -12.25, 95% CI: -22.39, -2.10) and ≥6 years (MD = -9.15, 95% CI: -16.21, -2.09).

ORAL ABSTRACT SESSIONS

Conclusion: Urbanization is associated with lower PA levels among children and adolescents in LMICs, with a small effect size (Cohen's d : -0.38 , 95% CI: -0.58 to -0.18). The qualitative and quantitative analyses findings support the PA transition model. As urban growth accelerates in LMICs, policymakers, public health professionals, and urban planners should prioritize designing cities that foster active living and support healthy lifestyles

Outdoor Time Patterns Among U.S. Youth: Findings from NHANES 2011-2014

K. Chen^{1,2}, E.A. Willis³, D. Hales³, C. Neshteruk^{1,2}

¹Duke University School of Medicine, Department of Population Health Sciences, Durham, United States, ²Duke University School of Medicine, Duke Center for Childhood Obesity Research, Durham, United States, ³University of North Carolina-Chapel Hill, Center for Health Promotion and Disease Prevention, Chapel Hill, United States

O.1.08 Children & Families: Youth Movement Behaviors and Health Outcomes: From Measurement to Intervention
Room 7, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Outdoor time supports child health by promoting physical activity, better sleep, and healthier lifestyles, while reflecting children's interaction with the surrounding environment. Surveillance of outdoor time patterns provides important context for health promotion and environmental planning. However, existing evidence relies on self- or parent-reported measures. Nationally representative estimates using device-based, population-level data are needed to better understand outdoor time among U.S. youth. This study aims to establish nationally representative estimates of youth's outdoor time using the National Health and Nutrition Examination Survey (NHANES) data.

Methods: In NHANES 2011-2014, participants wore an ActiGraph GT3x accelerometer on their non-dominant wrist, with the ambient light sensor enabled. Minute-level light intensity data were extracted for participants 3-18 years old. Participants were included with daily wear time ≥ 10 hours for ≥ 4 days. Data identified for poor quality or as outliers (4SD from the mean) were excluded. Outdoor time was defined as minutes with light intensity ≥ 240 lux, a value distinguishing indoor from outdoor time. Survey weights were applied to estimate mean daily outdoor time overall and by sex, age, race/ethnicity, season, and weekday.

Results: A total of 4,783 youth met inclusion criteria. The mean outdoor time was 29.5 min/day (SE: 1.7). Mean outdoor time did not differ significantly between male (29.1 min/day) and female (29.9 min/day) participants (95% CI: -2.6, 4.1). Non-Hispanic White youth had the highest mean outdoor time (32.6 min/day, SE: 2.4), followed by Non-Hispanic Black (28.1 min/day, SE: 2.5) and Hispanic youth (27.7 min/day, SE: 2.8). Mexican American youth had significantly lower mean outdoor time compared to Non-Hispanic White youth (-7.4 min/day, 95% CI: -12.7, -2.0). Compared to youths aged 3-5 years (11.7 min/day, SE: 1.4), youths aged 6-11 (24.4 min/day, SE: 1.5) and 12-18 (40.5 min/day, SE: 2.6) years had significantly higher mean outdoor time ($P < 0.001$). Youth had higher mean outdoor time during May-October compared to during November-December ($p = 0.01$), and more outdoor time Wednesdays-Saturdays compared to Sundays ($P < 0.001$).

Conclusion: This study developed a national reference for daily outdoor time among U.S youth. Findings provide essential evidence to inform public health strategies that promote outdoor activity and healthier environments for youth.

O.1.08 Children & Families: Youth Movement Behaviors and Health Outcomes: From Measurement to Intervention
Room 7, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: BMI reflects weight relative to height. Children often gain BMI faster during summer, but it's unclear whether this results from slower height growth or increases in weight. Further, it is unclear if BMI increases are related to increased body fat. This study explored monthly height, weight, BMI, and percent body fat (%BF) change during

ORAL ABSTRACT SESSIONS

school and summer to better understand what is driving accelerated summer BMI.

Methods: Children's (N=437, M=6.8 years) height, weight, and %BF (InBody 270 Body Analyzer) were measured monthly from January 2023 to August 2025. Age- and sex-specific zBMI was calculated using the United States Centers for Disease Control growth charts. Monthly percent change in children's height and weight and monthly change in BMI, zBMI, and %BF were estimated via multilevel mixed effects regression. Differences in mean monthly change in percent height and weight and monthly change in BMI, zBMI, and %BF between school (Aug-May) and summer (May-Aug) were explored.

Results: Monthly BMI change was 0.12 (95CI=-0.05, 0.29) during summer and 0.04 (95CI=-0.10, 0.17) in school (difference in change=0.09, 95CI=0.01, 0.16), while zBMI change during summer was 0.06 (95CI=-0.03, 0.14) and 0.02 (95CI=-0.04, 0.09) during school (difference in change=0.03, 95CI=-0.00, 0.07). Monthly %BF change during summer was 0.60 (95CI=0.09, 1.11) and 0.17 (95CI=-0.17, 0.52) during school (difference in change=0.43, 95CI=0.18, 0.68). Monthly percent height change was 0.13 (95CI=-0.15, 0.40) during summer and 0.13 (95CI=-0.08, 0.34) during school (difference in change=0.00, 95CI=-0.12, 0.12), while percent weight change during summer was 0.95 (95CI=0.25, 1.65) and 0.49 (95CI=-0.06, 1.04) during school (difference in change=0.43, 95CI=0.15, 0.77).

Conclusion: Monthly change in height was not different in the summer compared to the school year while changes in weight and %BF accelerated in the summer compared to the school year. These findings suggest that accelerated increases in BMI and zBMI during the summer were unhealthy as they are driven by accelerated increases in weight and %BF. Thus, interventions targeting unhealthy weight gain in the summer are warranted.

O.1.08 Children & Families: Youth Movement Behaviors and Health Outcomes: From Measurement to Intervention
Room 7, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Efforts to improve childhood physical fitness, an indicator of current health and predictor of future disease risk, are crucial. With competing demands on daily time-use, how to balance time spent in moderate-to-vigorous physical activity (MVPA), light physical activity (LPA), sedentary behaviour (SB), and sleep to enhance physical fitness across childhood and adolescence is unclear. To guide efforts, we examined associations of cross-sectional reallocations of time between movement behaviours and physical fitness at different ages across childhood and adolescence.

Methods: Participants in the Physical Activity and Nutrition in Children (PANIC) study had their physical fitness (cardiorespiratory fitness [CRF]: maximal workload from a cycle ergometer test; muscular power: standing long jump; muscular strength: dominant handgrip strength) and 24-hour time use (MVPA, LPA, SB, sleep via a combined heart rate and movement sensor) assessed in mid-childhood (6–9 years, n=448), late-childhood (8–11 years, n=370) and again in adolescence (15–17 years, n=136). Compositional data analysis, including compositional linear regression and iso-temporal substitution, investigated how time-use composition was associated with physical fitness levels after controlling for covariates.

Results: Reallocating time to MVPA, whether proportionally or from an individual behaviour, was positively associated with all physical fitness measures, while shifting time away from MVPA was negatively associated with physical fitness. For example, 15 minutes per day more time spent in MVPA was associated with higher CRF (range: 0.83–5.35 watts) and muscular power (range: 0.86–2.73 centimetres) at all ages and muscular strength (range: 0.25–0.55 kilopascals) in mid- and late-childhood. The negative impact of reducing MVPA was greater than the positive gains from increasing

ORAL ABSTRACT SESSIONS

it by the same amount. In adolescence, increasing sleep by 15 minutes per day was associated with higher CRF when time was reallocated from SB (1.81 watts, 95% confidence intervals [CI]: 0.44, 3.17) or LPA (2.52 watts, 95% CI: 0.98, 4.05) but replacing MVPA with sleep reduced CRF (-5.51 watts, 95% CI: -8.81, -2.21).

Conclusion: Strategies targeting physical fitness among children and adolescents, notably CRF and muscular power, should aim to increase, or importantly preserve, MVPA levels, and prioritise MVPA and sleep over SB and LPA.

Cross-sectional and Longitudinal Associations between School Day Movement Behaviours and Children's Perceived Physical Literacy: A Compositional Data Analysis

M. MacDonald¹, L. Clifford², J. Banks³, P. Edwards¹, A.-M. Gilmour¹, R. Tyler¹, S. Fairclough¹

¹Edge Hill University, Sport, Physical Activity, Health and Wellbeing Research Group, Department of Sport and Physical Activity, Ormskirk, United Kingdom, ²Liverpool John Moores University, The Physical Activity Exchange, Research Institute for Sport and Exercise Sciences, Liverpool, United Kingdom, ³Lancaster University, Division of Health Research, Lancaster, United Kingdom

O.1.08 Children & Families: Youth Movement Behaviors and Health Outcomes: From Measurement to Intervention
Room 7, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Promoting movement and physical activity within the school environment may shape the development of how children perceive their physical literacy (PL). However, associations between school-day movement behaviours and children's perceived PL and how these might change over time are unclear. The purpose of this study was therefore to examine cross-sectional and longitudinal associations between school-day movement behaviours and children's perceived PL.

Methods: Data were collected from 249 primary school aged children (aged 8–9 years; 51.4% girls) across four time points: autumn 2023 (T1), winter/spring 2024 (T2), summer 2024 (T3), and summer 2025 (T4). School-day movement behaviours (sedentary time (ST), light PA (LPA), moderate PA (MPA) and vigorous PA (VPA)) were assessed using wrist-worn accelerometers. Perceived PL was assessed by the Physical Literacy in Children Questionnaire (PL-C Quest), which consists of 30 pictorial items relating four PL sub-domains (physical, psychological, social, and cognitive). Compositional linear mixed models and isotemporal substitution examined the cross-sectional and longitudinal associations between school-day movement behaviours and children's perceived PL, and predicted changes in PL following movement behaviour time-reallocations.

Results: Cross-sectional analyses showed significant overall composition associations for total PL ($p = .03$) and PL physical domain ($p < .001$) at T3 and PL cognitive domain at T4 ($p = .001$). These associations were driven by ST for total PL ($\beta = 9.84$, 95% CI [1.80, 17.97]), ST and VPA for PL physical domain ($\beta = 4.97$, [1.15, 8.79]; $\beta = 3.60$, [0.64, 6.56]), and MPA for PL cognitive domain ($\beta = -4.30$, [-8.01, -0.58]). Cross-sectionally reallocating time indicated positive associations between 30 additional minutes spent in VPA and total PL ($d = 0.71$), physical ($d = 0.96$) and cognitive domains ($d = 0.57$) at T3. Time reallocated to MPA was inversely associated with total PL, cognitive and psychological domains at T4. There were no significant longitudinal associations between schoolday movement compositions and perceived total or domain-specific PL scores.

Conclusion: The findings suggest that school-day movement compositions have limited consistent impact on children's perceived physical literacy. A substantial increase in school based VPA is needed to achieve meaningful improvements. Further, the negative predicted change in PL with increase in MPA warrants further investigation given the reported positive association between PL and PA.

O.1.08-6

Father's Motivation as a Driver of Reciprocal Reinforcement in Fathers-child Dyads: Psychometric Properties of a Father-focused Instrument

O.1.08 Children & Families: Youth Movement Behaviors and Health Outcomes: From Measurement to Intervention Room 7, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: We hypothesize that fathers and children bidirectionally influence their health behaviors through reciprocal reinforcement (RR) processes. To operationalize RR, we developed a father-focused instrument, which consists of two scales: fathers' motivation for their own health (F-RR) and for their child's health (C-RR). Both scales use parallel wording across three domains of eating, exercise, and screen use. A community advisory board reviewed and informed F-RR and C-RR during development. We tested the psychometric properties of F-RR and C-RR.

Methods: Baseline data from the Healthy Dads, Healthy Kids for Hispanics efficacy trial were analyzed to validate the F-RR and C-RR using confirmatory factor analyses. Model assumptions were tested, and robust maximum likelihood estimation was used. Three models were compared: (A) three correlated first-order factors (Eating, Exercise, Screen Use), (B) a higher-order Lifestyle factor, and (C) a unidimensional model. For the best-fitting model, internal consistency (Cronbach's α), convergent validity (average variance extracted, AVE), and discriminant validity (Heterotrait-Monotrait ratio, HTMT) were assessed. Global fit was evaluated using CFI, RMSEA, and SRMR; local fit using residuals. Monte Carlo simulations tested the model stability.

Results: We analyzed data from 187 fathers (mean age=39.9 $\pm$ 7.1 years; 46% overweight, 54% obese) of 5–11-year-old children. Models A and B showed excellent fit (F-RR: CFI=0.959, RMSEA=0.075, SRMR=0.045; C-RR: CFI=0.979, RMSEA=0.056, SRMR=0.037), whereas Model C fit poorly (F-RR: CFI=0.782, RMSEA=0.166, SRMR=0.080; C-RR: CFI=0.868, RMSEA=0.135, SRMR=0.055). Model B was retained for parsimony and theoretical alignment. In the selected model B, F-RR demonstrated reliability (α =0.80-0.84), convergent validity (AVE=0.52-0.67), and discriminant validity (HTMT=0.66-0.69); C-RR showed reliability (α =0.66-0.85), convergent validity (AVE=0.44-0.77), and discriminant validity (HTMT=0.78-0.82). All factor loadings were significant and theoretically consistent. Standardized residuals were within acceptable limits ($<|2.0|$) and residual plots indicated adequate local fit. Monte Carlo simulations confirmed model stability.

Conclusion: F-RR and C-RR are psychometrically sound and provide a foundation for future research, comprehensive analysis, and interventions that leverage paternal motivation as a catalyst for sustained family lifestyle change. This study is an initial step in measuring RR under the premise that fathers' motivation (for themselves [F-RR] or their children [C-RR]) is a driver of RR processes within father-child dyads.

O.1.08-7

Social Media Use and Wellbeing Across Adolescent Development: A Longitudinal Cohort Study Using Annual Population Data

B. Singh¹, M. Zhou¹, R. Curtis¹, C. Maher¹, D. Dumuid¹

¹Adelaide University, Alliance for Research in Exercise Nutrition and Activity (ARENA), Adelaide, Australia

O.1.08 Children & Families: Youth Movement Behaviors and Health Outcomes: From Measurement to Intervention Room 7, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Social media's impact on adolescent wellbeing remains contested. While heavy use correlates with psychological distress, complete abstinence may lead to social exclusion and missed peer connections. Existing cross-sectional research limits causal inferences and obscures age and gender variations in these associations. This study investigated three-year longitudinal associations between after-school social media use and adolescent wellbeing in a large, representative dataset, with specific attention to developmental stage, gender, and the effects of both heavy use and abstinence.

Methods: This cohort study included 100,991 Australian students in Grades 4–12 (2019–2022), contributing 173,533 observations. After-school social media use (3:00–6:00 p.m. weekdays) was self-reported and classified as none (0 hours/week), moderate (>0 to <12.5 hours/week), or highest (≥ 12.5 hours/week). The primary outcome was overall wellbeing, measured as the average score across eight validated domains (happiness, optimism, life satisfaction, worry, sadness, perseverance, emotional regulation, and cognitive engagement), dichotomised into high versus low wellbeing (<3 on a 1–5 scale). Secondary outcomes included each individual wellbeing indicator, similarly dichotomised. Wellbeing was assessed concurrently with social media use during annual school-based surveys. Mixed-effects logistic models were used for cross-sectional and longitudinal analyses, stratified by gender and adjusted for demographic covariates.

ORAL ABSTRACT SESSIONS

Results: The analytic sample comprised 100,991 adolescents (49.9% female; mean [SD] age, 13.5 [2.2] years). A U-shaped association was observed between after-school social media use and wellbeing. Compared with moderate users, adolescents with the highest use had greater odds of low wellbeing (females: OR, 3.13; 95% CI, 2.88–3.39; males: OR, 2.25; 95% CI, 1.86–2.72), while non-users also had higher odds in later adolescence (Grades 10–12: females: OR, 1.80; 95% CI, 1.40–2.30; males: OR, 3.00; 95% CI, 2.01–4.46). These patterns were consistent across survey years and robust to sensitivity analyses.

Conclusion: Social media's relationship with adolescent wellbeing appears complex and non-linear, varying by age and gender. While heavy use was associated with poorer wellbeing and abstinence sometimes coincided with less favourable outcomes, these findings are observational and should be interpreted cautiously. Further research is needed to clarify causal pathways and underlying mechanisms.

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings

Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: There is a need to understand how changes in local food environments influence eating behaviour, as existing evidence is largely correlational. Studying this in real-life is challenging because settings such as shopping streets cannot be easily manipulated. To address this, we (1) designed a high-fidelity Immersive Virtual Reality (IVR) shopping street that allows precise manipulation of food outlets and advertisements, as well as accurate tracking of participants' behavior (motion, eye tracking), and (2) conducted a first RCT randomized controlled trial to test the impact of exposure to a healthy vs. unhealthy food environment on the perceived food environment and determinants of eating behaviour.

Methods: An IVR shopping street was developed in collaboration with health scientists, IVR specialists, and local policy officials through an iterative design process. An RCT was conducted with 65 participants (M age = 24.5y; 66.2% female). After a pre-survey, participants walked through either an "obesogenic" or a "healthy" shopping street (no fast-food outlets or junk food marketing) for four minutes. Eye-tracking data were collected to assess visual attention and reactions to food cues, followed by a post-test survey. Linear regression analyses examined perceptions and supportiveness of the food environment (7-point Likert scales) and post-test hunger (VAS 0–100), adjusted for age, gender, and baseline hunger.

Results: All participants felt the environment resembled places they often visit (M = 5.5). Participants in the obesogenic shopping street (n=32) rated the environment as less healthy (B=-2.85, P<.001) and unhealthier (B=3.81, P<.001) than participants in the healthy street (n=33). They also felt the environment made them think more about food (B=0.85, P=0.036), perceived it as more encouraging of unhealthy food choices (B=2.59, P<.001), and found it less acceptable (-1.03, P=0.002). Hunger did not increase significantly (B=2.60, P=.39). Eye-tracking descriptive data will be presented.

Conclusion: The IVR food environment enables controlled, ecologically valid experiments to test the potential impact of local food environment policies. This overcomes key limitations of real-world studies, that cannot be manipulated easily. Future studies with larger samples are needed to robustly assess simulated policy effects on food choices, or use the IVR tool to support policymakers in designing healthier environments.

ORAL ABSTRACT SESSIONS

O.1.09-2

Beverage Purchasing Patterns among Canadian Households, 2018–2020

V. Drolet-Labelle¹, V. Provencher¹, L. Vanderlee¹

¹Centre Nutrition, Santé et Société (NUTRISS), Institut sur la Nutrition et les Aliments Fonctionnels (INAF), Université Laval, Québec, Canada

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings

Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Beverages are a major source of added sugars in Canadian diets among both children and adults. This study examined household beverage purchasing patterns from 2018 to 2020 as well as differences across sociodemographic characteristics.

Methods: Nielsen HomeScan data from 13,324 households in Quebec and Ontario, Canada, were analyzed to examine annual purchases of six beverage categories: sugary drinks (i.e., all beverages with added sugars), coffee/tea, water, milk/plant-based milk, 100% juice, and diet beverages (i.e., other beverages without added sugars and/or with non-nutritive sweeteners). Beverages sold in a concentrated form or requiring preparation (e.g., tea or coffee) were converted to liters. Product descriptions and UPCs were matched with nutritional information and ingredients for 12,201 distinct products. Clusters were formed based on the proportion of each beverage category relative to the total volume purchased by each household. Adjusted and weighted multinomial regressions were conducted to examine differences by sociodemographic characteristics.

Results: The most frequently purchased beverages by volume were coffee and tea (30%), followed by sugary drinks (19%), milk (18%), water (16%), diet beverages (10%), and juice (7%). A **five-cluster model** provided the best overall fit, with a 16% misclassification rate, distinguishing households based on their annual purchase volume: “**Coffee and tea**” (38% of the sample; 54L of sugary drinks, 259L of coffee and tea), “**Milk**” (23%; 78L of sugary drinks, 153L of milk), “**Sugary drinks**” (18%; 240L of sugary drinks), “**Water**” (15%; 90L of sugary drinks, 330L of water), and “**Diet**” (7%; 56L of sugary drinks, 281L of diet beverages). The “Coffee and tea” cluster was used as the reference, as it was considered the “healthiest.” Households with children at home were more likely to be in the “Milk” cluster than in the “Coffee and tea” cluster. Households without a university degree were more likely to be in the “Sugary drinks,” “Water,” and “Diet” clusters than in the “Coffee and tea” cluster. Other sociodemographic differences will be discussed.

Conclusion: These findings underscore the importance of tailoring public health strategies to household characteristics, such as the presence of children and the household’s education level, to reduce sugary drink purchases more effectively.

O.1.09-3

The Impact of School-lunch Salad Bars on Adolescent Fruit and Vegetable Waste: A Clustered Randomized Control Trial

M. Bruening¹, M. Todd², M. McEntee³, P. Ohri-Vachaspati³, T. Richards⁴, M. Adams³

¹Penn State University, Nutritional Sciences, University Park, United States, ²Arizona State University, Edson College of Nursing and Health Innovation, Phoenix, United States, ³Arizona State University, College of Health Solutions, Phoenix, United States, ⁴Arizona State University, Morrison School of Agribusiness, Chandler, United States

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings

Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Adolescents consume too few fruits and vegetables (FVs). Schools in the US serve lunch to 30 million youth each day; schools are ideal environments to implement behavioral nutrition interventions. Interventions often focus on increasing consumption; however, understanding how interventions impact FV waste is also needed, as food waste is a driver of climate change, and has financial implications for school meal programs. We tested the impact of school-lunch salad bars on FV waste for adolescents in middle and high schools.

Methods: In a cluster randomized control trial across 24 schools in Arizona, USA (12 middle and 12 high schools; 2756 student observations), schools were randomized to either Salad Bar or Wait-Listed control conditions. Digital scales were used to objectively measure plate waste to the nearest 2 grams. FV waste was defined as the amount of FV left on the child’s tray (including rinds) minus the amount selected, then calculated as a proportion of the FVs selected (%FV wasted). Mixed effects ordinal beta regressions were used to examine how change in %FV waste differed between

ORAL ABSTRACT SESSIONS

conditions, adjusting for clustering of students within schools and students' socio-demographics.

Results: The sample of students was 52% female; 68.5% Hispanic; and 84% free/reduced-price lunch eligible. At baseline, the Wait-Listed (48.2%) and Salad Bar (52.5%) conditions did not differ in %FV wasted ($p=0.761$). The between-condition difference in change from baseline to follow-up was significantly different from 0 (Salad Bar – Wait-Listed difference in change = -17%; 95% CI = -0.21, -0.12; 1-tailed $p < 0.001$), with %FV wasted increasing by 9.1% in the Wait-Listed condition and decreasing by 7.8% in the Salad Bar condition. Both within-condition changes were significantly different from 0 (1-tailed $ps < 0.001$).

Conclusion: The introduction of the built environmental change of school-lunch salad bars resulted in lower FV waste relative to no intervention for adolescents in middle and high schools. Still, significant proportions of FVs were wasted regardless of study condition. Research is needed on the financial implications on FV waste in schools. Interventions are needed to simultaneously encourage students to consume more FV consumption while decreasing FV waste for human and planetary health.

O.1.09-4

AI-assisted Monitoring of Food and Alcohol Advertising: Validating Large Language Models against Human Coders

P.-A. Giti¹, R. Cerina², A. Grigoriev¹, S. Vandevijvere³

¹Maastricht University, Data Analytics and Digitalization, Maastricht, Netherlands, ²University of Amsterdam, Institute for Logic, Language and Computation, Amsterdam, Netherlands, ³Sciensano, Epidemiology and Health, Bruxelles, Belgium

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings

Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Social media marketing of unhealthy food and alcohol influences people's eating habits and alcohol intake, especially among adolescents and young adults. Because manual coding is costly and time-consuming, it remains difficult to monitor exposure at scale. This study examined whether Large Language Models can accurately identify nutritional and marketing features of food and alcohol advertisements, comparable to crowd and expert coders.

Methods: A sample of 1000 Facebook ads (image + caption) from 77 major Belgian food and alcohol brands was collected during a one-year period using the AdDownloader tool. The ads were annotated by 600 crowd participants, three expert dieticians and four multimodal AI models (GPT-4o, Qwen2.5, Pixtral and Gemma3). The classification task included three single-option variables (alcohol presence, ad type, target group) and three multi-option variables (premium offers, marketing strategies, WHO food categories). Agreement between all coders (crowd, dieticians and AIs) was calculated using Gwet's AC1 for single-option and Krippendorff's Alpha for multi-option tasks, complemented by bias analyses and Monte Carlo bootstrap validation.

Results: Large Language Models closely matched human performance in detecting simple single-option features, such as alcohol presence or target group, with over 90% agreement with expert dieticians. For more complex multi-option questions, AI reliability was lower but still remained within the range of human/dietician variability. Bootstrap simulations showed that in over 95% of replications, GPT-4o's agreement was within the inter-dietician range, indicating statistical exchangeability with humans. Bias analyses showed that AIs slightly over-detected promotional elements (e.g., limited editions, endorsements of characters/celebrities) and under-detected their absence, but these patterns were systematic and interpretable, and could be corrected by refining label definitions or prompt design. A smaller outdoor ad analysis produced similar agreement patterns, suggesting robustness across digital and physical advertising formats.

Conclusion: Validated AI models can classify food and alcohol advertisements with reliability comparable to expert dieticians. Monitoring of harmful marketing exposure in both digital and outdoor environments can be significantly improved by incorporating them into nutrition and public health research. This approach provides a scalable way of studying and addressing commercial influences on diet and health by combining automation with expert oversight.

O.1.09-5

Who Uses a New Major Walking and Cycling Bridge? A 12 Month Study Using Novel Mobile Phone Sensor Data in Glasgow, UK

E. Lawlor¹, F. Gabler Trisotti¹, J. Olsen², R. Mitchell¹, C. Gray¹, J. Gill¹

¹University of Glasgow, Glasgow, United Kingdom, ²University of Queensland, Brisbane, Australia

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings
Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Built environments can be designed to encourage physical activity. The Govan-Partick Bridge, one of Europe's largest opening walking and cycling bridges, opened across the River Clyde in Glasgow, UK. It aims to promote active travel, reduce car dependency, and contribute to the city's net-zero climate targets. Current active travel measures (e.g. pedestrian/cycling counters), capture overall volumes of users but provide little information about *who* is using active travel infrastructure. Therefore, this study aims to evaluate the impact of a new major active travel bridge using a novel mobile phone sensor to examine the socio-demographic, spatial profile and temporal patterns of users.

Methods: A mobile phone sensor, mounted on the bridge, continuously captured anonymised data from approximately 35% of all mobile phone users crossing between September 2024 and September 2025. The sensor recorded people walking, cycling, or wheeling past with a Virgin Media O2 mobile, recording socio-demographic indicators (age, gender, spending power), spatial locations (residential and employment) and temporal patterns of use (number of visits by a user, number of crossings per hour). Aggregated data were analysed descriptively and visualised through an interactive online dashboard.

Results: Over 12-months, 1,266,111 UK users were recorded. At one year, 58% of users were male. The largest age group was 25-34 years (20%), followed by 65+ (19%), with the smallest group being 18-24 (11%). Spending power was generally high. Usage was highest at weekends, peaking between 2-3pm on Saturdays. 46% of users had visited once that month and 29% had 2-5 visits. Spatial analysis showed that the highest user residential postal sectors were in the local vicinity, with the top two in an area of high deprivation however, employment location was varied and extended across the city.

Conclusion: The new bridge has experienced high levels of active travel. Using this mobile phone sensor has provided unique large-scale insights into users and an innovative method for evaluating active travel infrastructure. A wider two-year evaluation will triangulate these findings with surveys, counters, observations, and interviews to assess the bridge's longer-term impacts on transport and health as it becomes embedded within the community.

O.1.09-6

A Cluster Randomized Controlled Trial of a Multilevel Physical Activity Intervention: Community Walks

L. Quintiliani^{1,2}, J. Murillo², D. Phiri², I. Spinola³, A. Singh⁴, A. Rolles², J. Kane⁵, D. Cummings⁶, S. Crouter⁷, J. Bather⁴, M. Goodman⁴, J. Dedier^{8,9}

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings
Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Multilevel interventions can impact several behavioral determinants; yet evidence among low-income urban adults is lacking. We are conducting a multilevel trial to compare an individual-level intervention, an environmental-level intervention, and their combination on moderate physical activity among low-income residents of U.S. public housing developments in Boston Massachusetts, hypothesizing the combined intervention would produce the greatest increase over a 2-year period.

Methods: The study design is a prospective, factorial, cluster randomized controlled trial, with housing developments (n=12) as the units of randomization. There are four groups: environmental intervention alone (3 developments), individual intervention alone (3 developments), environmental plus individual intervention (3 developments), and

ORAL ABSTRACT SESSIONS

assessment only control group (3 developments). The environmental intervention includes: community health worker (CHW)-led activities, pedestrian advocacy trainings, and maps/signage displaying walking routes. The individual intervention is a 12-week automated telephone program to increase motivation and self-efficacy. Intervention activities are designed to be enjoyable, safe, and accessible and are promoted through collaboration with front-line housing staff. Physical activity is measured at baseline, 12-, and 24-months by actigraphy in an evaluation cohort representing a sub-sample of participants across all developments. Descriptive statistics were used to summarize data.

Results: The evaluation cohort consisted of 479 residents. Mean (range) age was 53.8 (18-90) years, with the majority being women (79.5%) and Hispanic/Latino (64.0%). Half reported high blood pressure (50.4%); one-quarter reported diabetes (26.9%). At baseline, mean minutes/day (SD) was 234.5 (230.3) for sedentary, 122.2 (132.7) for light, and 24.3 (38.6) for moderate intensity physical activity. Across 6 environmental-level developments, we hosted 12 pedestrian advocacy training sessions (mean 9.4 residents/session) and 880 CHW-led activity sessions: 73.0% indoor activities and 27.0% outdoor walking groups (89.0% of sessions had ≥ 1 resident attend). 140 residents enrolled in the automated telephone program across 6 individual-level developments. Resident reported barriers to participation and comparison of physical activity levels between groups from baseline to 12-month follow-up using multilevel models will be presented.

Conclusion: Participants with high co-morbidities from marginalized communities were enrolled in this on-going multi-level intervention. While challenging, continued community and housing partnerships, addressing resident-reported barriers, and offering multiple, flexible, culturally relevant activities may encourage future participation.

O.1.09-7

Impact of Light Rail Transit on Physical Activity and Travel Behaviors: Longitudinal Findings from the TROLLEY (TRAnsit Opportunities for Health, Livability, Exercise and Equity) Study

K. Crist¹, T. Benmarhnia², J.F. Sallis²

¹San Diego State University, Exercise and Nutritional Sciences, San Diego, United States, ²UC San Diego, La Jolla, United States

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings

Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Light rail transit (LRT) may improve physical activity (PA) and air pollution by shifting travel mode. While promising, evidence of the impact of LRT on PA has been inconsistent. The TROLLEY study assessed change in PA and travel behaviors following the opening of a new LRT line. We expected PA and active travel to increase among those living closest to new LRT.

Methods: Participants were diverse, university staff who lived either <1 mile, 1-2 miles, or ≥ 2 miles from an LRT station. Participants wore accelerometers and GPS devices and completed questionnaires three times over a 2-year period, in addition to self-reporting PA and travel behaviors prior to new LRT. Multilevel mixed effects models analyzed change in outcomes, adjusting for individual and block group level covariates.

Results: Participants (N=479) were 45 years of age, mostly female (68%), and nearly 40% were people of color. Half of the sample lived <2 miles from LRT. Compared to living ≥ 2 miles from LRT, living closer to a station was positively associated with becoming a new LRT commuter (OR: 2.96 (95% CI 2.03-4.32) for <1 mile and OR:2.30 (1.48-3.56) for 1-2 mile group. Those living closest to LRT had a significant increase in the number weekly LRT commute days, compared to those furthest away. There was a 70% increase in the odds of getting any transportation PA (TPA) among new LRT commuters (OR:1.65 (95% CI 1.15-2.34)) and a significant increase of 145 minutes/week of TPA in the 1-2 mile group. Preliminary analyses show 35% and 40% used LRT to commute at 1 and 2-years of follow up, respectively, compared to 28% immediately following the LRT opening. Multilevel models of PA and travel mode outcomes at 1 and 2 years of follow up will be completed by February 2026.

Conclusion: The introduction of a new LRT line was associated with a substantial shift from driving to LRT as a primary commute mode and increased TPA among those living closest to transit. Encouraging LRT use may help address the health burden from physical inactivity and vehicle emissions.

ORAL ABSTRACT SESSIONS

O.1.09-8

Healthy Beverages in a Sugary World: Dutch Adolescents' Perspectives on Healthy Beverages, a Qualitative Multi-method Study

R. Pepping^{1,2}, V. Busch², A. Verhoeff², J.C Seidell¹, B. Groot-Sluijsmans¹

¹VU University, Health Sciences, Amsterdam, Netherlands, ²Public Health Service of Amsterdam (GGD), Healthy Living, Amsterdam, Netherlands

O.1.09 Policies and environments: Multi-level Interventions in Youth Food and Activity Settings
Room 8, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Much is known about what drives teenagers' consumption of sugar-sweetened beverages. However, far less is understood about what influences them choosing healthy options. Moreover, little is known about how adolescents define healthy beverages and what *they* consider to be healthy drinks. The aim of this study is twofold: 1) to explore how Dutch adolescents conceptualize healthy beverages, and 2) to gain a holistic understanding of the lived experiences that shape their behaviour regarding healthy beverages so that more effective future intervention endeavors can be designed.

Methods: A qualitative multi-method approach [1] was used to gain in-depth insights into adolescents' perceptions and behaviours regarding healthy beverages by combining three complementary methods: street intercept interviews, group sessions and semi-structural interviews. Data were collected from April to June 2025, both online as in person. A total of 60 Dutch adolescents, aged 12 to 16, attending prevocational-level secondary school (VMBO), participated in the study. All data were coded and analysed using Reflexive Thematic Analysis.

[1] Morse JM. Principles of Mixed Methods and Multimethod research design In: Tashakkori A, & Teddlie, C. , editor. Handbook of mixed methods in social & behavioral research Thousand Oaks, Californie: SAGE Publications 2003.

Results: Four overarching themes were generated: (1) conceptualizing healthy beverages: teenagers' perspectives; (2) refreshing but not exciting: teenagers' perspectives on tap water and associated doubts; (3) what teens wat: taste, fun and worth my money; (4) teenagers' perspectives on choosing healthy drinks: preferences and strategies for change. Water was widely recognized as healthy, energy drinks as unhealthy; soft drinks and fruit juices, however, occupied a grey area. Uncertainty about the health consequences of drinking light or zero options leads to teenagers drinking regular sodas.

Conclusion: Teenagers' confusion among drinks echoes scientific non-consensus, leading to blurry and sometimes contradicting advice towards the public. The food industry leverages this ambiguity through health claims and branding, while disinformation on platforms like TikTok – e.g. skepticism about tap water or protein drinks – further clouds adolescents' perceptions. Clearer and more consistent communication from the scientific community, stricter marketing regulations, and effective strategies to counter misinformation are essential to support adolescents in making healthier choices.

O.1.10-1

Contribution of AI-detected Pedestrian Environment Features (PEFs) to the Explanation of Physical Activity and Obesity among Adults

X. Shi¹, M.A. Adams², W. Bachman¹, J.F. Sallis³, T. Conway³, L.D. Frank^{4,1}

¹Urban Design 4 Health, Rochester, United States, ²Arizona State University, School of Technology for Public Health, Phoenix, United States, ³University of California San Diego, Herbert Wertheim School of Public Health and Human Longevity Science, San Diego, United States, ⁴University of California San Diego, Department of Urban Studies and Planning, San Diego, United States

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments
Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: This study examined whether artificial intelligence (AI)-detected pedestrian environment features (PEFs) - such as sidewalks, curb cuts, crosswalks, walk signals, and streetlights - contribute to explaining physical activity and obesity outcomes beyond macro-level walkability factors. We hypothesized that greater coverage of PEFs would be independently associated with higher levels of moderate-to-vigorous physical activity (MVPA) and lower obesity prevalence, after adjusting for neighborhood built and sociodemographic characteristics. This study is among the

ORAL ABSTRACT SESSIONS

first to link large-scale AI-detected pedestrian infrastructure data to objectively measured accelerometer-based MVPA.

Methods: Data were drawn from 1,022 adults across four US metropolitan regions (Seattle, Phoenix, Baltimore, and San Diego) participating in the SAFE and WalkIT studies. Validated deep learning models were applied to over 20 million Google Street View images to detect eight types of PEFs. Pedestrian feature coverage within 400m of each participant's neighborhood was estimated using a network-based "dense node" approach. Hierarchical and ridge regression models were used to assess independent associations between PEFs, MVPA, and obesity, adjusting for individual, social, and macro-level built environment factors.

Results: Six of eight PEFs were significantly associated with higher MVPA, including sidewalks ($\beta = 0.21$, $p < 0.001$), curb cuts ($\beta = 0.19$, $p < 0.001$), streetlight ($\beta = 0.16$, $p=0.009$), sidewalk buffer ($\beta = 0.08$, $p=0.017$), crosswalk ($\beta = 0.09$, $p=0.015$), walk signal ($\beta = 0.08$, $p = 0.029$). This translates into an average increase of 19.1 minutes in weekly MVPA if all six types of PEFs were to double in a typical neighborhood. A weighted PEF index was also constructed and validated. While PEFs were negatively associated with obesity, the associations were not significant at the $p<0.05$ level.

Conclusion: AI-detected, micro-scale pedestrian features are significant and modifiable correlates of physical activity, in addition to neighborhood walkability. Investing in such infrastructure represents a scalable, evidence-based strategy to foster activity-supportive environments and promote population health. This study also validates deep learning as a robust and efficient tool for quantifying micro-scale built environments at scale.

O.1.10-2

Does Brand-only Advertising Weaken Marketing Restriction Efficacy? An Experimental Study of Youth's Hypothetical Menu Item Selection

L. Boyar^{1,2}, C.M. White³, S.I. Kirkpatrick³, L. Vanderlee⁴, D. Hammond³

¹BC Children's Hospital Research Institute, Vancouver, Canada, ²University of British Columbia, School of Population and Public Health, Vancouver, Canada, ³University of Waterloo, School of Public Health Sciences, Waterloo, Canada, ⁴Université Laval, École de Nutrition, Québec, Canada

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments
Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Children are particularly susceptible to food marketing, which impacts dietary practices by influencing product awareness, attitudes, and purchasing intent. Marketing policies typically rely on nutrient profile model thresholds to decide whether a food/beverage advertisement would be restricted, and commonly exempt brand-only advertisements (i.e., advertisements featuring brand imagery, such as logos/mascots, without any identifiable products). This study examined the relative impact of brand-only versus product-specific advertising on youth's hypothetical menu item selection.

Methods: An online between-group experiment was conducted in 2023 with 5,744 youth aged 10-17 years from six countries. Youth were randomised to view one of four advertisements: 1) control (video game), 2) 'brand-only' (McDonald's logo), 3) 'brand and unhealthy food' (McDonald's logo and hamburger), or 4) 'brand and healthy food' (McDonald's logo and salad). Youth were then shown six McDonald's menu items and asked which they would choose to eat. Regression models tested differences in products selected and nutrient levels by advertisement condition.

Results: Youth who saw the 'brand and unhealthy food' advertisement were slightly more likely to select the item featured in the advertisement (17.5%; Quarter Pounder Deluxe) than youth who saw the 'brand-only' (15.0%, OR:1.20, $p=0.068$) and 'brand and healthy food' (14.2%, OR:1.29, $p=0.013$) advertisements. Differences in product selection between youth who saw the 'brand-only' and 'brand and unhealthy food' advertisements were otherwise minimal and did not translate into significant differences in nutrient levels. Youth who saw the 'brand and healthy food' advertisement were more likely to select the garden salad (5.7%; product featured in 'brand and healthy food' advertisement and only menu item meeting nutrient profile model thresholds), and selected items with less saturated fat and energy than those who saw the 'brand and unhealthy food' (3.8%, OR:1.53; saturated fat β :-0.66; kilocalories β :-25.50) and 'brand-only' (3.5%, OR:1.49; saturated fat β :-0.62; kilocalories β :-26.06) advertisements ($p<0.05$ for all).

Conclusion: Brand-only advertisements may have similar impacts on youth's selection of unhealthy products as advertisements featuring specific unhealthy foods, whereas advertisements featuring healthy products may encourage healthier selection. These findings underscore the importance of including brand-only advertising in global marketing restriction development to support efficacy.

ORAL ABSTRACT SESSIONS

O.1.10-3

From Citizen Perceptions to Policy Action: Mapping Food Environments Using the Big Food Map App in Flanders

J. Benhaïem¹, S. D'Hooghe^{1,2}, J. Van Kerckhove^{1,3}, S. Vandevijvere¹

¹Sciensano, Epidemiology, Brussels, Belgium, ²Vrije Universiteit Brussel, Brussels, Belgium, ³Ghent University, Primary Care and Public Health, Ghent, Belgium

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments
Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: This study investigates the hypothesis that citizen-driven, subjective data on food environments can effectively inform actions to improve those environments. We address three interlinked goals: raising citizen awareness of the food environment, generating a large-scale map of perceived food-environment quality across Flanders, and fostering public support for food-environment policy.

Methods: We developed the “Big Food Map” smartphone application through co-creation with stakeholders (local governments, retailers, short-chain initiatives), citizens — including those in vulnerable groups — and app developers. Over four months, participants evaluated retail food-locations, answered daily perception/behaviour questions tied to locations, and engaged in weekly thematic challenges on themes such as advertising, short-chain initiatives and ideal food environments. 4 707 participants registered (2 364 active). Recruitment was open to the general public via media, social outreach and incentives; 4 707 registered, of whom 2 364 were active. Descriptive analyses were performed on participation patterns, demographic characteristics, and user responses, complemented by qualitative coding of open-ended inputs. Future work will apply logistic regression to identify demographic and contextual predictors of perceived “healthy” food locations, and clustering techniques to detect user typologies based on food-environment perceptions.

Results: The sample mean age was ~50.8 years (SD 14.7), 69.9 % female; education skewed high (~70 % had higher/university education). Users spanned rural (35 %), peri-urban (22 %) and urban (43 %) zones. Initial findings show that “accessibility” was ranked the top reason for choosing a food-point (16.5 %), followed by “taste” and “personnel friendliness” (both 8.9 %). Mobility patterns differed markedly: in urban zones 79 % of journeys to food points used active modes (walk/bike), versus 54 % car use in rural zones. Qualitative themes emerging include strong citizen demand for local/short-chain initiatives, affordability, and enhanced accessibility.

Conclusion: This large-scale, citizen-science initiative offers a novel tool for mapping subjective food environments and generating actionable insights. The citizen-science approach yielded high engagement and substantial data on perceived food-environments, offering a fresh angle for food-environment policy. It bridges behavioural nutrition (perceptions/choices) and environment/policy science (availability/accessibility). The outputs are now being used in municipal workshops to co-design local food-environment policies. This app is scalable and transferable to other contexts.

ORAL ABSTRACT SESSIONS

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments

Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: South Africa faces a nutrition transition with an escalating double burden of malnutrition (undernutrition, micronutrient deficiencies, overweight/obesity), which is significantly influenced by the food environment. The Healthy Food Environment Policy Index (Food-EPI) was developed to evaluate the implementation of public food environment policies in comparison with international best practice. The aim of this study was to assess the extent of implementation of healthy food environment policies in South Africa using an expanded version of Food-EPI which includes indicators related to the double burden of malnutrition, compare its progress since the assessment in 2016, benchmark implementation against international best practice, and develop a list of priority policy actions.

Methods: The assessment was conducted in a stepwise approach, which included tool adaptation to the context using expert and policy reviews, identification of international best practice, and evidence validation, and two workshops involving a panel of national experts from government, academia and civil society to benchmark current food environment policies across 60 indicators and prioritize a list of policy actions based on perceived implementation gaps.

Results: 70% of the indicators were rated at low / very low levels of implementation. Of the 48 original indicators, the mean implementation improved between 2016 and 2024, driven by the introduction of a sugar-sweetened beverage tax, increased evidence uptake and health impact assessments in policy development, and the new draft food labelling regulation. Of the 12 (new) indicators that addressed the double burden of malnutrition, eight were rated at low to very low levels of implementation. Priority policy actions, considered relevant and achievable, included regulation of the food marketing directed at children, increase of the sugar-sweetened beverage tax to an effective level, supplement income support programs, and ensure affordability of healthy foods for vulnerable populations. Policies are also needed to regulate the relationship with industry, ensure adequate resource allocation, and implement monitoring and evaluation mechanisms to increase accountability.

Conclusion: Application of the expanded Food-EPI in South Africa showed improvements for the original indicators compared with 2016 and highlights the need for additional policy efforts to improve public nutrition policy and address the double burden of malnutrition.

O.1.10-5

Correlations between Physical Activity Environments and Flood Risk across the United States: Disparities by Social Vulnerability, Rurality, and Region

M. Wende¹, S. Aytur², J. Gustat³, M.R. Umstattd Meyer⁴, K. Valentine Goins⁵, J. Stroope⁶

¹University of Florida, Health Education and Behavior, Gainesville, United States, ²University of New Hampshire, Department of Health Management and Policy, Durham, United States, ³Tulane University, School of Public Health and Tropical Medicine, New Orleans, United States, ⁴Baylor University, Department of Public Health, Waco, United States, ⁵University of Massachusetts Chan Medical School, Worcester, United States, ⁶Louisiana State University, School of Kinesiology, Baton Rouge, United States

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments

Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: We aim to examine the county-level correlations between flood risk and environmental infrastructure that supports physical activity, including access to parks and the National Walkability Index. Additionally, we aim to analyze differences across social vulnerability, urban-rural status, and region.

Methods: This cross-sectional analysis included 3,142 counties across the contiguous United States. Data were merged from public health and governmental sources, including 2018 FEMA's National Flood Hazard Layer (quantifying the percentage of county land in 100- or 500-year flood zones), the 2018 CDC/ATSDR Social Vulnerability Index (SVI; grouped into tertiles), and 2013 USDA Rural-Urban Continuum Codes (RUCC). Proximity to parks from the National Environmental Public Health Tracking Network and the county-level EPA National Walkability Index (aggregated from block group data) were based on 2018 data. Spearman correlations (ρ) were calculated and stratified by RUCC, region, and SVI tertile.

Results: Overall, both park access ($\rho=0.17$, $p<0.0001$) and walkability ($\rho=0.33$, $p<0.0001$) were positively correlated with flood hazard. Stratified analysis revealed significant heterogeneity. In metropolitan counties, park proximity and walkability were significantly correlated with flood hazard (parks: $\rho=0.10$, $p=0.04$; walkability: $\rho=0.42$, $p<0.0001$). Conversely, non-metropolitan counties showed no significant correlation to park access ($\rho=-0.04$, $p=0.48$), and when compared to the metropolitan correlation, walkability had a significantly weaker correlation with flood hazard ($\rho=0.12$,

ORAL ABSTRACT SESSIONS

$p=0.02$). Regional analysis showed correlations with flood hazard were strongest in the Northeast and West. The West showed robust positive relationships for park proximity ($p=0.29$, $p<0.0001$) and walkability ($p=0.63$, $p<0.0001$), and the Northeast was similar (parks proximity: $p=0.27$, $p<0.0001$; walkability: $p=0.49$, $p<0.0001$). The Midwest and South regions exhibited somewhat weaker positive correlations (Midwest park proximity: $p=0.08$, $p=0.03$; Midwest walkability: $p=0.17$, $p<0.0001$; South park proximity: $p=0.05$, $p=0.10$; South walkability: $p=0.15$, $p<0.0001$). The strongest positive correlations with flood hazard were found in the lowest social vulnerability tertile (park proximity: $p=0.32$, $p<0.0001$; walkability: $p=0.48$, $p<0.0001$).

Conclusion: This analysis underscores the importance of climate adaptation and resilience planning that incorporates locally informed approaches to mitigate disproportionate flood risks to physical activity infrastructure, particularly in communities with lower social vulnerability, metropolitan counties, and regions in the western and northeastern United States.

O.1.10-6

Quantifying Health and Economic Benefits of Active Transportation Investments and Supportive Land Use Actions within Government Decision Making Processes: The National Public Health Assessment Model

L. Frank¹, W. Bachman², X. Shi²

¹UC San Diego, Urban Studies and Planning, San Diego, United States, ²Urban Design 4 Health, Inc., Rochester, United States

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments
Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: The National Public Health Assessment Model (N-PHAM) is a Peer-Reviewed and Federally-Funded Software Tool that has been applied in 15 Regions of North America to assess health impacts of contrasting land use and transportation investment scenarios. N-PHAM employs a quantitative health impact assessment framework and has been applied at a wide range of geographic scales from neighbourhood, corridor, to entire regions to inform government actions and investment decisions over the past 2 decades. Agencies that have employed N-PHAM have stories to share how the evidence N-PHAM provided was used to document health and economic benefits of active transportation and supportive land use actions.

Methods: N-PHAM is a suite of random parameter predictive models capturing duration of walking and biking, physical activity, obesity, diabetes, cardiovascular disease, and depression, chronic disease. These models are built off California Health Interview Survey (CHIS / N=54,000) and National Household Transportation Survey (NHTS) (N=45,000) datasets joined at the census block group level with built (walkability), regional accessibility, demographic, greenspace metrics. These California based models used variables that exist for the entire USA creating the ability to estimate current baseline health characteristics employing existing values for environmental and demographic metrics for each health outcome model anywhere in the USA. It allows end users to test and compare potential changes in health outcomes from densification, adding shops, services, green space, and other features.

Results: Results from the application of N-PHAM over the past 20 years in 15 different regions of North America will be summarized and presented: Implementing Agency, Intended Outcome and Purpose, Health Outcomes Across Scenarios, Use of Evidence and Impact on Agency Policies, Synthesis of Findings Across Case Studies, Limitations of Methods, and Proposed Next Steps.

Conclusion: The ability to directly apply research to decision making is a primary goal for scholars and policy advocates. N-PHAM has documented health and related economic importance of active transportation investments and elevated and protected billions in funding for active transportation infrastructure. In Los Angeles N-PHAM helped to protect \$12.9 Billion in active transportation funding by documenting an \$8.41 return on investment from active transportation from health care cost savings and workforce productivity.

O.1.10-7

Peeking Behind the Algorithm: AI-enabled Surveillance of Unhealthy Food Marketing to Children on Youtube

D.L. Olstad¹, S. AlSharani², S. Fietz¹, L. Radin-Pereira¹, C. Elliott², M. Potvin Kent³, I. Lalani¹, R. Prowse⁴, T. Williamson¹

¹University of Calgary, Department of Community Health Sciences, Calgary, Canada, ²University of Calgary, Calgary, Canada, ³University of Ottawa, Ottawa, Canada, ⁴Memorial University of Newfoundland, St John's, Canada

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments

Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Whereas industry has leveraged artificial intelligence (AI) to market unhealthy food to children on digital media in covert ways, researchers continue to manually assess these AI-enabled tactics. To address these gaps, we developed the CHOPPED (CHild Oriented food Product Promotion Evaluation and Detection system) AI system that can automatically collect and analyze food marketing on digital media. The purpose of this study was to use CHOPPED to examine unhealthy food marketing in YouTube videos suggested to child and adult accounts based on age and gender.

Methods: Over two months of continuous monitoring, CHOPPED collected and analyzed all marketing instances shown before, during, and after videos suggested by YouTube's algorithm to six child (2-12 years) and two adult accounts from four major cities in Canada (n=60,633). Marketing instances were classified based on whether they featured unhealthy foods and used child-targeted marketing techniques. The extent and nature of monthly child-targeted unhealthy food marketing were characterized during a 24-hour daily viewing period and children's typical 2-hour daily viewing period.

Results: No food marketing instances were shown to child accounts 2-4 years. On average, child accounts (5-12 years) were shown 25 monthly unhealthy food marketing instances during a 2-hour daily viewing period. The boy's account (9-12 years) was shown a significantly higher monthly frequency of child-targeted unhealthy food marketing instances (340, 70.2%) than the boy's account aged 5-8 years (241, 66.2%), the girl's account aged 5-8 years (261, 60.6%), the man's account (224, 79.9%), and the woman's account (263, 54.7%) during a 24-hour (p<0.05) but not a 2-hour daily viewing period. The monthly frequency of some core child-targeted techniques shown to the boy's account (9-12 years) was significantly higher than that shown to other accounts during a 24-hour (p<0.05) but not a 2-hour daily viewing period.

Conclusion: This study is the first to demonstrate the potential of AI to monitor unhealthy food marketing to children on YouTube. Findings suggest that children's exposure to unhealthy food marketing on YouTube may be relatively low and that food marketers may target a general audience, rather than children based on age and gender.

O.1.10-8

Examining Public Support for Comprehensive Policy Packages to Tackle Unhealthy Food Environments

S. Wahnschafft^{1,2}, A. Spiller², Y. Boztuğ³, P. von Philipsborn^{1,4}, D. Lemken⁵

¹University of Bayreuth, Public Health Nutrition, Bayreuth, Germany, ²University of Göttingen, Agricultural Economics and Rural Development, Göttingen, Germany, ³University of Göttingen, Economics, Göttingen, Germany, ⁴LMU Munich, Public Health and Health Services Research, Munich, Germany, ⁵University of Bonn, Institute for Food and Resource Economics, Bonn, Germany

O.1.10 Policies and environments: Measuring and Modelling Healthy Food and Activity Environments

Room 9, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: This study examines public support – and its drivers – for comprehensive policy packages (i.e. bundles of coherent policy measures introduced together) aimed at improving food environments.

Methods: The study was conducted in Germany via an online survey. The sample included 1200 eligible German voters, recruited based on age, gender and income quotas. Participants completed an online survey with a choice-based conjoint experiment, where they evaluated pairs of policy packages comprising up to seven distinct food environment measures. After choosing a preferred package or opting for a single policy, participants designed their ideal policy package. Based on their choices, respondents were categorized as resistant, inclined or supportive towards policy packaging according to their frequency of opting out for single measures and the number of policies

ORAL ABSTRACT SESSIONS

they included in their ideal package.

Results: Based on both opt-out frequency (44.7 %) and ideal policy packaging (72.8 %) outcomes, most respondents were inclined towards policy packages. The inclusion of fiscal incentives and school-based measures in packages enhanced support, while fiscal disincentives reduced it. Key drivers of support included beliefs about the importance of diet-related issues and the role of government in regulation, while socio-demographic factors, political leaning and personal experience with diet-related disease had minimal impact.

Conclusion: The results reveal public appetite for policy packages to address unhealthy food environments, contingent on package design and beliefs about the issue's severity and legitimacy of intervention. Public health advocates should design and promote policy packages aligned with public preferences, especially given anticipated opposition from commercial interests.

O.1.11-1

La Cruz que Cargamos: A Sociocultural Perspective of Health and Lifestyle through the Lived Experiences of Immigrant U.S.-Mexico Borderland Residents Living with Type 2 Diabetes

L. Mitchell-Bennett¹, M.V. Saldana¹, S. McCurdy², B. Reininger¹

¹University of Texas Health Science Center Houston, School of Public Health, Brownsville, United States, ²University of Texas Health Science Center Houston, School of Public Health, Houston, United States

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: The U.S.-Mexico borderland population experiences high rates of chronic disease, persistent poverty and other non-medical barriers to healthy lifestyle behaviors like physical activity and nutrition. The purpose of this study was to explore adverse and protective non-medical drivers of health from a sociocultural perspective through the lived experiences of Texas-Mexico borderland residents with type 2 diabetes, to provide more effective chronic disease management interventions and give voice to an often-marginalized population.

Methods: This mixed method study included semi-structured, in-depth interviews with 20 residents of the Texas-Mexico borderlands living with type 2 diabetes. We used an engaged critical phenomenological approach with a focus on understanding the meaning people give to their lived experiences; embedded within the socioeconomic, cultural and political context by exploring participant sense-making and emotions related to topics. Demographic questions, the Adverse Childhood Experience (ACE) Immigration survey, and the Accountable Health Communities (AHC) Health-Related Social Needs (HRSN) Screening were administered to further describe the study sample.

Results: Several phenomena emerged from the interviews: *Beyond familism, work and life exhaustion, geographic challenges, walking associated with poverty and immigrant status, stress makes me sick. 'Desahogar' (unburdening) and "cargar la cruz" (faith as empowering)* were coping mechanisms. *Borderland culture familiarity* emerged as a protective factor. The participants were monolingual Spanish speaking, low-income, middle-aged to older adults ranging in age from 44-73, 50% with less than 8 years of formal education, all having immigrated to the U.S. over the age of 18. Participants reported experiencing childhood and adulthood trauma as well as multiple complex social determinants of health needs, including food insecurity, transportation and interpersonal safety barriers.

Conclusion: The study provides unique socio-cultural insight into an immigrant population living in the U.S.-Mexico borderlands with type 2 diabetes experiencing multiple and complex SDOH challenges. Findings from this study can contribute to improving non-medical behavior change interventions related to physical activity, nutrition, stress and chronic disease prevention and control. This study highlights protective and resilience factors that should be also considered in intervention design. Insight into the lived experiences of individuals seldom included in mainstream narrative is important for further research with populations experiencing similar conditions.

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: The association between self-reported 24-hour movement behaviour (physical activity (PA), sedentary behaviour, and sleep), with health and disease is well documented. However, device-measurement of these behaviours in low-income settings is rare, with particular need for comparative studies, given the very different lives of rural and urban dwellers.

Methods: In Malawi, we invited a stratified, random sample of 3,489 individuals aged ≥ 15 years participating in a larger urban and rural Long-Term Conditions survey, to wear a wrist-worn accelerometer (Axivity AX3) continuously for one week. The survey collects demographic, behavioural (including the International Physical Activity Questionnaire Short Form) and health data. Data were processed in R (GGIR package) to derive PA and sleep variables, and Inverse Probability Weighting used to account for the sampling strategy.

Results: To date, 2,939 participants have provided accelerometry data (weighted mean age 34.1 (SD 16.1); 59.2% female; 45.8% urban dwelling). Participants provided a median of 7 valid 24-hour recordings (IQR: 6–7) with minimal non-wear time (median 0.15%, IQR: 0–1.2%). Accelerometer-measured PA and self-reported PA (total MET-minutes) showed weak positive correlation (Spearman's $\rho = 0.3$, $p < 0.001$) that was similar between sites. However, urban participants had significantly lower total acceleration for the same self-reported PA ($\beta = -14.1$ mg, $p < 0.001$). Median overall (unweighted) acceleration (Euclidean Norm Minus One, ENMO) was 47.8 mg/day (IQR: 35.7–59.7). The median intensity gradient, reflecting the distribution of intensity across the day, was -2.25 (IQR: -2.4 to -2.2). The median minutes of moderate-to-vigorous physical activity (MVPA) were 1521 minutes/week (IQR: 1075–1952). Median sleep period duration was 7.1 hours/night (IQR: 6.2–7.9), sleep efficiency was 83.8% (IQR: 79.3–87.5%), and median inactive time was 10.0 hours/day (IQR: 8.7–11.7).

After weighting, compared to urban, rural participants had higher ENMO (53.5 vs 39.9 mg/day), more MVPA (1744 vs 1316 minutes/week), and less inactive time (median 9.6 vs 11.2 hours/day), all $p < 0.001$. Sleep periods and sleep efficiency were similar across sites.

Conclusion: Device-measured PA was lower in urban than rural participants for the same self-reported PA, suggesting self-report may not adequately capture differences between contexts. Objective measurements are needed to accurately quantify differences in 24-hour movement behaviours.

O.1.11-3

A Mixed-methods Analysis of Oregon Double Up Food Bucks Participants' Nutrition Security during and after SNAP Emergency Allotments

S. Grutzmacher¹, M. Kasimanickam², J. Geldhof², R. Ward³, M. Watson³, J. Caris³, J. Jackson²

¹University of Arizona, School of Nutritional Sciences and Wellness, Tucson, United States, ²Oregon State University, Corvallis, United States, ³Farmers Market Fund, Portland, United States

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Emergency allotments (EA) temporarily increased Supplemental Nutrition Assistance Program (SNAP) benefits to the maximum monthly allotment, substantially reducing food insecurity in the U.S. during the pandemic. Double Up Food Bucks Oregon (DUFBO), a nutrition incentive program that matches SNAP dollars for fruit and vegetable purchases, expands purchasing power at farmers markets and small grocers. Because SNAP policy strongly shapes

ORAL ABSTRACT SESSIONS

nutrition incentives, this study explores how having and losing EA shaped DUFB participants' perceptions of nutrition security and DUFB participation.

Methods: A cross-sectional survey of 331 DUFB participants was conducted after EA ended in 2023. Participants answered parallel sets of seven questions about having and losing EA and open-ended questions about having and losing EA. Multinomial logistic regressions assessed perceptions during and after EA, while thematic analysis was applied to qualitative data.

Results: Participants were predominantly women (65%), aged 25–64 (72%), and non-Hispanic White (75%). Over 90% agreed that increased SNAP benefits helped them afford enough food, buy preferred foods, buy more fruits and vegetables, reduce stress, and afford other basic needs. Participants expressed stronger sentiment about EA's positive impact than its loss, though food-insecure households reported greater harm from termination (RRR=2.4, $p=.022$). No demographic differences emerged.

Themes indicated EA improved food security, diet quality, and autonomy, while reducing stress and enabling budget flexibility. Termination led to increased food insecurity, financial strain, and reliance on cheaper, less nutritious foods. Coping strategies included meal skipping and food pantry use. Some relied more on DUFB to offset benefit loss, while others reduced participation due to limited SNAP funds and transportation costs.

Conclusion: EA substantially improved food security and well-being, while termination exacerbated hardship and constrained choices. Though most participants felt more strongly about EA's positive impact than termination's negative impact, the coping strategies they employed undermine nutrition, chronic disease prevention, and mental health. DUFB provided critical support, but could not fully compensate for reduced SNAP benefits. Findings underscore the importance of considering the time, hassle, tradeoffs, and cost of food decisions, the adequacy of SNAP benefits, and overall household needs in policy decisions, particularly amid significant SNAP eligibility and benefit cuts.

O.1.11-4

Ultra-processed Food Purchases in England, 2012–2019 and 2022: A Sociodemographic and BMI-stratified Analysis

K. Ullian¹, S. Cummins¹, A. Medina-Lara², L. Cornelsen¹

¹London School of Hygiene and Tropical Medicine, Department of Public Health, Environments and Society, London, United Kingdom, ²University of Exeter, Public Health Economics Group, Exeter, United Kingdom

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: To assess how ultra-processed food (UPF) purchasing varies across sociodemographic characteristics and Body Mass Index (BMI).

Methods: Take-home food and non-alcoholic drink purchase data for England (2012–2019, 2022) included ~77,000 households. Products were classified as UPF using NOVA and further divided into High Fat, Salt and Sugar (HFSS) or non-HFSS using the UK Nutrient Profiling Model, aligning with current policy criteria. UPF shares by spending (£), calories (kcal), and volume (kg) were modelled by income, education, ethnicity, socioeconomic position (SEP), and BMI using Quasi Maximum Likelihood Estimation with cluster-robust errors, adjusting for shopper age, gender, household composition, region, and year.

Results: UPF accounted for 59% of total purchased take-home calories, 55% of spending, and 48% of volume purchased, with minimal year-to-year variation. HFSS UPF contributed more calories (35%) and spending (29%), while non-HFSS UPF accounted for 24% of calories and 30% of volume. UPF purchasing (All UPF and HFSS UPF) was higher among lower-income (Kcal OR 1.23; Spending 1.32; Volume 1.22–1.29, all $p<0.001$), lower-SEP (Kcal 1.20–1.23; Spending 1.27–1.30; Volume 1.24–1.26, all $p<0.001$), and less-educated households (Kcal 1.16–1.19; Spending 1.19–1.23; Volume 1.17–1.19, all $p<0.001$). Asian households purchased less UPF than White households (Kcal OR 0.67–0.79; Volume 0.61–0.82; Spending 0.73–0.88, all $p<0.01$). Households with a shopper living with obesity purchased more UPF (Kcal 1.11–1.12; Spending 1.12–1.14; Volume 1.12–1.19, all $p<0.001$). Differences in non-HFSS UPF purchasing across these subgroups were minimal.

Conclusion: A sociodemographic and BMI gradient in UPF purchasing was observed, with lower-income, lower-education, lower-SEP and higher BMI households purchasing more UPF. Lower UPF purchasing among ethnic minority households may reflect protective cultural dietary patterns or the underrepresentation of culturally specific food outlets in the dataset. Inequalities in purchasing were driven by HFSS products, confirming that HFSS-focused policies may be an effective tool to reduce dietary inequalities.

ORAL ABSTRACT SESSIONS

O.1.11-5

The Agency Dimension of Food Security: Measurement Development and Application

E. Calloway¹, C. Milburn Atkinson¹, K. Nelson¹, G. Stott¹, J. Schrum², M. Dinglasan², A.L. Yaroch¹

¹Center for Nutrition and Health Impact, Omaha, United States, ²New Jersey Office of the Food Security Advocate, Trenton, United States

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: There is increasing momentum in development around the construct of food security, including by the Food and Agriculture Organization of the United Nations, to add *Agency* (ability of individuals/households to act on their own food decisions and engage in processes to shape the food system) to the four traditional dimensions of food security (Availability, Accessibility, Utilization, and Stability). However, there is no available survey measure to assess Agency. The purpose of this study was to develop, test, and apply a novel Agency scale.

Methods: An initial pool of questions was drafted from newly written and modified existing questions. The pool was reviewed during a focus group of stakeholders (n=12), and revisions were made based on feedback. The revised pool was piloted among community members (n=300) and underwent item-reduction steps to identify poor-performing questions and exploratory factor analysis to understand groupings (i.e., factors). Two factors were retained and underwent assessment of convergent validity, reliability, and confirmatory factor analysis (CFA) in a new sample (n=720). The finalized scale was then used to examine sociodemographic differences in Agency among food pantry clients (n=1,054) using a generalized linear mixed model.

Results: CFA fit statistics met acceptable thresholds (e.g., RMSEA=0.069, SRMR=0.022, CFI=0.986), meaning the hypothesized model fit the observed data (supporting construct validity). Scale scores were associated with scores for Availability, Accessibility, Utilization, and Stability in expected directions ($\rho=0.161-0.743$, all $p<0.001$) (further supporting construct validity). Cronbach's alpha was high at 0.89 (supporting reliability/internal consistency). When examining sociodemographic differences in Agency among food pantry clients, after controlling for other sociodemographics and clustering effects, being on the WIC nutrition assistance program ($p=0.01$), speaking English ($p<0.01$), and having a household income higher than \$4,000 USD ($p=0.04$) were associated with greater Agency.

Conclusion: The scale measuring perceived household/individual-level Agency was shown to be valid and reliable in this sample. It was used to examine Agency among food pantry clients and found that governmental assistance programs and language access efforts may support Agency. This scale may strengthen the ability to assess all dimensions of food security beyond traditional financial-access-focused measures in the USA as well in other countries.

O.1.11-6

Mapping Behavioral, Social, and Healthcare Pathways to Diabetes Hospitalizations in California: A Configurational Analysis

A. Descarpentrie¹, Q. Huang², T. Alderete³, M. Goran¹, J. Espinoza⁴

¹Children Hospital of Los Angeles, Pediatrics, Los Angeles, United States, ²Northwestern University, Political Science Department, Evanston, United States, ³Johns Hopkins Bloomberg School of Public Health, Department of Environmental Health and Engineering, Baltimore, United States, ⁴Ann & Robert H. Lurie Children's Hospital of Chicago, Stanley Manne Children's Research Institute, Chicago, United States

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Diabetes-related hospitalizations strain U.S. healthcare systems and, while often seen as a reflection of care access, may be influenced by more complex, context-specific factors, ie, behaviors and social determinants of health (SDoH). This ecological study examined whether limited healthcare access was a necessary condition for high hospitalization rates in California's 58 counties and identified specific combinations of SDoH and behaviors that create sufficient pathways to elevated rates.

ORAL ABSTRACT SESSIONS

Methods: Using 2023 county-level data from the Agency for Healthcare Research and Quality and the County Health Rankings initiative, we applied machine learning-enhanced Qualitative Comparative Analysis to assess 20 behavioral, social, healthcare, economic, and demographic factors in relation to high hospitalization risk. Elevated hospitalization risk-adjusted rates were defined as counties exceeding the statewide benchmark of 234.4 hospitalizations per 100,000 adults (21 counties).

Results: No individual behavior nor SDoH, including insurance coverage or primary care provider rates, emerged as a necessary condition. Instead, five sufficient configurations were identified, each explaining 38–43% of high-hospitalization counties. Conditions defining the identified solutions included a low proportion of seniors (characterizing four solutions), low rates of uninsurance (four solutions), and high prevalence of insufficient sleep (three solutions), with some pathways also marked by predominantly male (two solutions), urban populations (two solutions) and limited availability of non-physician care providers (one solution).

Conclusion: These findings highlight the multifactorial nature of diabetes-related hospitalizations in California and suggest that expanding insurance or primary care provider coverage alone may be insufficient to reduce admissions. Public health strategies may benefit from combining targeted, context-specific approaches (particularly those focused on younger populations), behavioral risk mitigation, and expanding team-based care for men in urban settings to improve diabetes management and reduce hospitalizations.

O.1.11-7

Co-creating a Neighborhood-based Lifestyle Desk to Support Healthy Living among Residents with Socioeconomic Challenges and Limited Health Literacy in Amsterdam

M. Gündüz¹, J. van den Helder¹, S. Mul¹, R. Hengelaar - van Dijk¹, P.J. Weijs^{1,2}, J.D. Schoufour¹

¹Amsterdam University of Applied Sciences, Faculty of Health, Sport and Physical Activity, Amsterdam, Netherlands,

²Amsterdam University Medical Centers, Vrije Universiteit, Department of Nutrition & Dietetics, Amsterdam, Netherlands

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Older adults in socioeconomically disadvantaged urban neighborhoods face increased risk of chronic disease, social isolation, and often encounter barriers to preventive lifestyle support due to limited health literacy and fragmented services. Addressing these challenges requires citizen science and co-creation approaches that actively involve community members and local organizations in developing context-specific solutions. This citizen science project therefore aims to establish a *Neighborhood Lifestyle Desk* that offers accessible, culturally sensitive, and personalized lifestyle support for older adults.

Methods: A participatory co-creation process was conducted with residents, community workers, healthcare professionals, local authorities, and students to jointly identify priorities, design criteria, and contextual enablers for a one-year pilot of the Lifestyle Desk. Guided by the socio-ecological model and the RE-AIM framework, the process used a triangulated qualitative approach combining field notes and logbooks, co-creation workshops, and semi-structured interviews. Field notes and logbooks captured contextual dynamics, informal interactions, and neighborhood engagement. Joint and separate co-creation workshops were conducted with stakeholders to define the aims, functions, and design criteria of the lifestyle desk, ensuring equal participation and transparent idea prioritization through the nominal group technique. Semi-structured interviews with professionals and local authorities explored existing collaboration and priorities. All data were thematically analyzed, with attention to cultural sensitivity, organizational enablers and barriers, and multi-level influences which highlights by the socio-ecological framework.

Results: Bringing together residents, professionals, and local organizations successfully fostered mutual understanding and shared ownership. The co-creation process produced clear design criteria and culminated in the collective naming of the project “*Gezond en Ontmoet in Osdorp (GOO)*”, emphasizing both on health and social connection. Three overarching themes emerged: (1) trust and familiarity as key enablers of engagement, (2) cultural and linguistic accessibility, and (3) strengthened collaboration across health and social domains. The co-created GOO prototype is currently being implemented and evaluated in a one-year pilot.

Conclusion: This participatory citizen science study demonstrates how researchers and community stakeholders can collaboratively translate community needs into a feasible prototype for neighborhood-based lifestyle support. The co-creation process offers valuable insights and preliminary blueprint for developing a culturally sensitive, Neighborhood-based Lifestyle Desk for older adults in socioeconomically disadvantaged urban areas.

ORAL ABSTRACT SESSIONS

O.1.11-8

Grow.Cook.Eat: Supporting a Community Living with Disadvantage to Build Food Literacy and Connection

K.A Bolton¹, K. Wingrove¹, R. Lindberg¹, E. Litterbach², V. Brown³, S. Reeves⁴, K. Reeves⁴

O.1.11 Socio-economic inequalities: Bridging Gaps in Health Equity: Community-Centered Approaches to Nutrition and Lifestyle

Multipurpose Room, May 28, 2026, 12:00 PM - 1:00 PM

Purpose: Rising living costs, poor access to affordable healthy food, and being swamped with unhealthy options pose major health challenges to the Norlane community (the most disadvantaged area in Victoria, Australia). The Good Neighbourhood Project, a community-led placemaking organisation, takes a whole-of-neighbourhood and whole-of-person approach to create healthy, sustainable, inclusive, and resilient communities. Their strategies include: social enterprise cafés, an urban farm, a community garden, neighbourhood meals, and a food co-operative. Community feedback revealed a demand for food literacy skill-building.

Methods: The Good Neighbourhood Project partnered with Deakin University to co-design, deliver and evaluate a pilot food literacy program Grow.Cook.Eat. Free weekly sessions for 6 months were held at a social enterprise café adjacent to a community garden to build nutrition knowledge, cooking and gardening skills via growing, cooking and sharing a meal. A mixed-methods evaluation included surveys, session evaluations and interviews. Thematic analysis of follow-up interviews against the RE-AIM framework helped understand implementation and impact.

Results: Follow-up interviews revealed that the majority of participants were: 60+ years old, female, retired/unable to work; and many were living on their own (*Reach*). Participants had a strong sense of engagement, enjoyment and perceived value of Grow.Cook.Eat; improved food knowledge, cooking skills and increased fruit and vegetable intake and social connection (*Effectiveness*). Motivation to participate included poor cooking knowledge/skills, living with medical/health issue and social isolation (*Adoption*). Participants reported high program satisfaction and acceptability; with inclusivity suggestions for participants living with disabilities. Facilitators thought implementation success was rooted in relationships and social capital. Gardening engagement was lower (poor weather, limited growing space at home, mobility challenges) (*Implementation*). Participants replicated recipes independently at home, had plans for a home vegetable garden and wanted to program to continue. Facilitators reported succession planning, supporting local cost recovery and active promotion would enhance Grow.Cook.Eat's longevity and reach (*Maintenance*).

Conclusion: Co-designed, place-based food literacy programs can build community trust and engagement while addressing local needs such as food security and food literacy skills. Embedding opportunities for social connection into food literacy programs enhances impact beyond empowering community members with nutrition knowledge by fostering a healthier more connected community.

O.2.12-1

The Bloom Study – An Early Childhood Obesity Prevention Program Embedded in the Existing Health Service by Community Health Nurses in Denmark

M. Rasmussen¹, L. Kierkegaard¹, R.R. Carlsson¹, M.P. Jensen¹, T.R. Ubbesen¹, K.R. Madsen¹, T.P. Pedersen¹, C.T. Bonnesen¹

¹University of Southern Denmark, National Institute of Public Health, Denmark, Denmark

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: In Denmark, health promotion delivered by community health nurses (CHNs) has been a universal health promoting service for families with newborns for more than 75 years. The service is well-established, characterized by a high level of professional competence, and highly trusted by families. Typically, families receive 5–6 home visits during the child's first year, with the guidance and support tailored to each family's circumstances and needs. Based

ORAL ABSTRACT SESSIONS

on the recognition of the importance of early prevention, the Danish CHN service holds considerable potential for promoting healthy weight development in early childhood. The Bloom Study explores this potential by developing, implementing, and evaluating an intervention promoting healthy weight among infants, embedded within the CHN service. This study presents the strategies of the Bloom Study for ensuring successful embedding of the intervention into the service of CHNs in Denmark. Results from the development phase, strategies reflected in the final intervention design and experiences from early parts of the implementation will be presented.

Methods: The Bloom Study was developed through an extensive co-creation process involving parents and CHNs. The final intervention provides an enhanced service for first-time parents, focusing on eating and meal routines, motor skills and movement, screen habits, sleep, and a safe psychosocial family environment. Deliveries to families include additional home visits, telephone consultations, supportive dialogue tools, access to a video library, and parent group involvement.

Results: To support successful embedding in the CHN service, the development phase explored the implementation capacity, including staffing, financial resources, management engagement, competence level and training needs. The findings from the capacity analysis informed the final intervention design. Examples include focus points addressed (e.g. sleep), number of extra home visits and telephone consultations, duration of the intervention and themes prioritized in the teaching course provided to CHNs.

Conclusion: The Bloom Study resembles an example of an intervention program in which development and design are based on systematic exploration on how to increase the chance of successful embedding in an existing health service. This approach is taken to maximize the likelihood of successful and long-term sustainability within the Danish health system of CHNs.

O.2.12-2

A Qualitative Study of Parental Physical Activity and Diet Health Behaviours in First Time Parents in England

H. Little¹, R. Kipping², N. Heslehurst³, E. van Sluijs¹, K. Hesketh^{4,1}

¹University of Cambridge, MRC Epidemiology Unit, Cambridge, United Kingdom, ²The University of Bristol, Bristol, United Kingdom, ³Newcastle University, Newcastle, United Kingdom, ⁴University College London, London, United Kingdom

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Early parenthood offers an important window of opportunity to make positive behaviour changes to support parent, child and family health. Yet little is known about how new mothers and fathers experience changes in their diet, physical activity (PA) and sleep across early parenthood, or what support new parents require. This qualitative study aimed to a) understand new parents' diet and PA behaviours and how these were related to sleep quality in 3-6 months postpartum) and b) assess their related support needs.

Methods: First-time parents with infants aged 3-6 months were recruited using purposive sampling via parent and child groups in England, UK (January-March 2025). Semi-structured telephone/online interviews explored parents' own diet and PA. Participants also completed the validated Pittsburgh Sleep Quality Index (PSQI). Using Nvivo 12 software, verbatim transcripts were analysed inductively using Reflexive Thematic Analysis and a constructivist approach. Using the PSQI score, two groups were derived using median split (median= 6; better vs poorer sleepers). Qualitative sub-group analyses were undertaken to determine whether themes differed by parents' sleep quality.

Results: Participants from diverse socioeconomic, geographical and ethnic backgrounds (n=27, 37% men) completed interviews. Three themes common to all participants included: 'new routines for diet and PA behaviours'; 'expectations and hopes for future diet and PA'; and 'external support to support health behaviours'. An additional theme was identified through sub-group analyses: 'perceptions of diet and PA behaviours' were more positive for parents with better sleep scores and more pessimistic for poorer sleepers. Support needs were consistent regardless of sleep quality, with parents stating they would like greater social support from other parents at a similar life stage; and digital resources to help with meal planning and PA.

Conclusion: First-time parents described wide-ranging benefits and challenges to maintaining diet and PA behaviours during early parenthood. Sleep quality varied across participants, and appeared to influence their perceptions of diet and PA, rather than their behaviours directly. Quantitative exploration of these relationships in first-time parents is now warranted. Bringing together new parents in similar circumstances, and using digital materials, may better support positive diet and PA behaviours during the transition to parenthood.

ORAL ABSTRACT SESSIONS

O.2.12-3

Associations between Caregiver Mental Health Symptoms and 3- to 4-year-Old Children's Movement Behaviours

T. Karppinen¹, K. Uusitalo^{2,3}, P. Koski¹, J. Lahti³, I. Stamhuis⁴, N. Wackström^{2,3}, U.-M. Luoma^{5,2}, A. Okely⁶, E. Roos^{2,3}, E. Engberg^{2,3}

¹University of Turku, Faculty of Education, Rauma, Finland, ²Folkhalsan Research Center, Helsinki, Finland, ³University of Helsinki, Faculty of Medicine, Helsinki, Finland, ⁴Open University of the Netherlands, Faculty of Psychology, Heerlen, Netherlands, ⁵Oulu Deaconess Institute Foundation sr, Department of Sports and Exercise Medicine, Oulu, Finland, ⁶University of Wollongong, Faculty of the Arts, Social Sciences and Humanities, Wollongong, Australia

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Understanding factors influencing children's movement behaviours is essential for healthy development. However, the role of caregiver mental health in shaping these behaviours is understudied. We examined associations between caregiver mental health symptoms and 3- to 4-year-old children's movement behaviours, including physical activity, sedentary time, digital media use, and sleep. We also investigated whether these associations were modified by caregivers' and child gender.

Methods: The cross-sectional SUNRISE Finland study included 1082 children (mean age 4.0, SD 0.6 years; 46% girls) and 1485 caregivers (65% women). Caregivers completed mental health questionnaires (Center for Epidemiologic Studies Depression Scale, Generalized Anxiety Disorder-7, Perceived Stress Scale, Insomnia Severity Index) and reported child digital media use. Children wore ActiGraph accelerometers for seven days to assess physical activity, sedentary time, and sleep.

Results: After adjusting for several sociodemographic confounders, higher caregiver stress was associated with shorter child sleep duration ($\beta = -0.43$, 95% CI -0.79, -0.08). Caregivers' higher depressive symptoms, ($\beta = 0.50$, 95% CI 0.18, 0.81) and stress ($\beta = 0.51$, 95% CI 0.13, 0.90) were associated with increased passive digital media use among children. Caregivers' higher stress ($\beta = 0.52$, 95% CI 0.18, 0.85) and insomnia symptoms ($\beta = 0.61$, 95% CI 0.18, 1.05) were associated with greater child gaming. We observed interactions by caregiver gender or by child gender in several associations. Only men caregivers' higher levels of stress were associated with more child sedentary time ($\beta = 1.08$, 95% CI 0.30, 1.86) and men caregivers' higher depressive ($\beta = 0.69$, 95% CI 0.15, 1.23) anxiety ($\beta = 1.57$, 95% CI 0.34, 2.80) and insomnia symptoms ($\beta = 1.43$, 95% CI 0.59, 2.27) were associated with more child gaming. Caregivers' insomnia symptoms were associated with increased passive digital media use only in boys. ($\beta = 1.44$, 95% CI 0.71, 2.17). Caregiver mental health symptoms did not associate with child physical activity.

Conclusion: This study highlights the potential relevance of caregiver mental health in shaping children's sedentary time, sleep and digital media use. These findings may inform the development of family-based interventions and public health strategies.

O.2.12-4

Correlates of Physical Activity and Motor Skills of Children Aged 3-6 Years Old: An Overview of Reviews

S.B. Nijenhuis¹, K.M. Bel^{2,3}, S.I. de Vries^{2,3}, E. Hartman¹

¹University Medical Center Groningen, University of Groningen, Department of Human Movement Sciences, Groningen, Netherlands, ²The Hague University of Applied Sciences, Centre of Expertise Health Innovation, The Hague, Netherlands, ³Leiden University Medical Centre Health Campus The Hague, Department of Public Health and Primary Care, The Hague, Netherlands

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Physical Activity (PA) and Motor Skills (MS) in young children are influenced by correlates operating at multiple levels as described by the socio-ecological model of Sallis et al. (2006). Previous studies that investigated correlates of PA and MS often examined these correlates in isolation, lack transferability to specific target groups or might be outdated today. Therefore, the aim of this overview of reviews is to synthesize the current evidence of the correlates of PA and MS in children aged 3- to 6-year-olds. These insights will guide the development of effective

ORAL ABSTRACT SESSIONS

system approaches and provide directions for future research.

Methods: An overview of reviews (i.e., umbrella review) was conducted, following specific guidelines developed for overview of reviews (Fernandez et al., 2025; Gates et al., 2022). PubMed, PsycINFO and ERIC were searched for eligible studies from 2020 up until January 21, 2025. Inclusion criteria were formulated in line with the PECOS framework (Morgan et al., 2018). The Rayyan web tool was used for removing duplicates and assessing eligibility (Ouzzani et al., 2016). The quality of the included studies and study overlap were assessed with the AMSTAR-2 and GROOVE tools, respectively (Bracchiglione et al., 2022; Shea et al., 2017). Evidence synthesis was done with summary codes, leading to certainty of evidence per identified correlate.

Results: A total of 31 reviews/meta-analyses were included in this study. The number of primary studies per review/meta-analysis varied from 9 to 150 and were published between 1988 and 2023. In total, 323 distinctive correlates of PA and/or MS of 3- to 6-year-olds were identified. For most correlates, inconsistent evidence was found.

Conclusion: The inconsistent evidence found for most correlates underscores the highly context-dependent nature of PA behaviour and MS development in children. Moreover, confounders (e.g., sex, age, PA intensity level and type of MS) and the different definitions and assessment methods for PA and MS should be considered when investigating specific correlates in this target group.

Altogether, this overview of reviews provides a comprehensive overview of correlates that can be used to develop effective system approaches to increase PA and MS in young children.

O.2.12-5

Associations between 24-hour Movement Behavior Reallocations and Endothelial Dysfunction Biomarkers in Youth with Overweight and Obesity: An Isotemporal Substitution Analysis

K. Moore¹, T. Chapman², T. Pickering², T. Mason², J. Unger², J. Courtney³, S. Castillo², K. McAlister⁴, J. Huh², C. Dieli-Conwright⁵, K. Page², J. Kaslander², M. Hewus², B. Belcher², G. Dunton²

¹University of Southern California, Population and Public Health, Los Angeles, United States, ²University of Southern California, Los Angeles, United States, ³University of North Carolina Chapel Hill, North Carolina, United States, ⁴Fit Minded, Los Angeles, United States, ⁵Harvard, Cambridge, United States

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Endothelial dysfunction, characterized by impaired vasodilation and vasoconstriction, is an early and reversible marker of cardiovascular disease (CVD) and is more prevalent in youth with overweight and obesity (OW/OB). Although higher physical activity (PA) and lower sedentary time (ST) are associated with improved cardiometabolic profiles, little is known about how time reallocations between daily movement behaviors influence early indicators of vascular health. Isotemporal substitution analysis (ISA) is an approach to model the effects of replacing one behavior with another while holding total daily time constant. This study applied ISA to examine whether reallocating ST to PA or sleep was associated with biomarkers of endothelial dysfunction in youth with OW/OB.

Methods: Children aged 8–11 years with OW/OB wore activPAL accelerometers for seven days to capture time spent in ST, light-intensity PA (LPA), moderate-to-vigorous PA (MVPA), and sleep. Fasting blood samples taken directly after the activity monitoring week were analyzed for soluble intercellular adhesion molecule-1 (sICAM-1) and vascular cell adhesion molecule-1 (sVCAM-1). ISA models estimated effects of reallocating 10- and 18-minutes between behaviors, adjusting for age, sex, ethnicity, maternal education, and body fat (%).

Results: Participants (n=37; mean age=9.4±1.1y; 37.8% female; 62.2% Hispanic) accumulated 686±97 min/day of ST, 79±93 min/day of LPA, 36±18 min/day of MVPA, and 616±67 min/day of sleep. Reallocating 10 and 18 min of ST to LPA was associated with lower sICAM-1 (Δ =-2.36 and -3.80 ng/mL; 95% CIs -4.54, -0.18 and -7.38, -0.26; p=0.03), whereas reallocating 10 and 18 min of LPA to MVPA (Δ =8.46 and 14.03 ng/mL; 95% CIs 3.05, 13.86 and 5.91, 22.14; p<0.01) or sleep (Δ =4.24 and 8.05 ng/mL; 95% CIs 0.27, 8.22 and 0.56, 15.55; p=0.04) corresponded with higher sICAM-1. No reallocations were significantly associated with sVCAM-1.

Conclusion: Reallocating as little as 10 min/day of ST to LPA was linked to favorable sICAM-1 concentrations, suggesting that even modest behavioral changes may yield measurable vascular benefits in youth with OW/OB. Public health efforts that encourage short, frequent bouts of LPA throughout the day could be beneficial in reducing early CVD risk in this population.

Leveraging Built-in Mobile Device Motion Sensors to Enhance Measurement of Mobile Device Usage in Children: Evaluating Model Performance across a Standardized Screen Time Protocol

O. Finnegan¹, A. Holowiecki¹, C. Yalla¹, T. Adair¹, B. Armstrong¹, H. Yang¹, S. Nelakuditi¹, R. Ghosal¹, J. White¹, M. Savidge¹, G. Randolph¹, K. Bowen¹, J. Culverhouse¹, K. Kiely¹, A. Holmes¹, Z. Zhong¹, M. Beets¹, E. Adams¹, S. Burkart¹, E. Willis², R.G. Weaver²

¹University of South Carolina, Columbia, United States, ²University of North Carolina Chapel Hill, Chapel Hill, United States

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Objectively measuring how children use mobile devices is challenging, especially when devices are shared among family members. Passive sensing provides an objective way to track use, but it cannot reveal who is actually holding the device. Recent work suggests that motion sensor data might help identify users, yet these findings may be confounded by the types of applications used and have not been tested for temporal stability. This study tests whether models trained on standardized activities can reliably identify users, and whether this identification remains stable over time.

Methods: Thirty-seven parent-child dyads (children: 9.4 ± 1.8 years, 57% female; parents: 41.8 ± 6.7 years, 70% female) engaged in a ~30-min standardized protocol, where they played a counterbalanced series of games (i.e., Like a Dino, Block Blast, Toy Blast, Melon Maker) and watched YouTube videos on a Pixel tablet, while a sensor logging application captured tablet accelerometer and gyroscope data. Random Forest models were trained to classify each target user against three unseen test users using an 80/20 split, with performance averaged across target users. First, models were trained on four activities (Toy Blast, Melon Maker, YouTube, Like a Dino) and tested on one activity (Block Blast) to evaluate how models perform when participants are doing the same activities. Second, models were trained on the first instance of users watching YouTube and tested on the second instance of users watching YouTube (1 to 25-min gap) to evaluate temporal stability.

Results: When models were trained on four activities and tested on one activity, models performed well in predicting when it was *not* the target user (Specificity: 0.93 ± 0.13), and moderately when predicting when it *was* the target user (Sensitivity: 0.61 ± 0.41). When trained on the first instance of YouTube and tested on the second instance of YouTube, Specificity was also strong (0.93 ± 0.14), but Sensitivity was low (0.48 ± 0.43).

Conclusion: Although previously strong model performance does not appear to be driven by the model only identifying the game being played, the temporal instability highlighted in the current study warrants further investigation of this and other machine learning methods to identify mobile device users.

O.2.12-7

The Early Movers Pilot Intervention: Encouraging Healthy Movement Behaviours in Infants

V. Carson¹, M. Potter¹, M. Boyd¹, L. Pritchard¹, G. Faulkner², S. Liu³, K. Hesketh⁴

¹University of Alberta, Edmonton, Canada, ²University of British Columbia, Vancouver, Canada, ³University of Victoria, Victoria, Canada, ⁴Deakin University, Geelong, Australia

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Adherence to the Canadian 24-Hour Movement Guidelines among infants (<1 years) is low across demographic groups, impacting overall development. To increase guideline dissemination and activation, the Early Movers Intervention was developed and piloted. The primary objectives of this study were to: 1) explore the feasibility of the Early Movers intervention protocol, including recruitment, retention, data collection, and procedures and 2) explore the acceptability of the intervention by parents and public health nurses.

Methods: In partnership with the local public health authority, Alberta Health Services, a randomised controlled trial (RCT) was conducted with 60 infants (Intervention: n=31; Control: n=29; Baseline: 2.3 ± 0.2 months old) and

ORAL ABSTRACT SESSIONS

their parents. Participants were recruited from public health centres in Edmonton, Alberta Canada during routine 2-month immunization appointments. The intervention group received: 1) an educational resource (i.e., hand-out) regarding the 24-Hour Movement Guidelines from public health nurses at their 2-month immunization appointment and 2) follow-up support via access to a digital app with evidence-based information and support from an online toolkit as well as weekly text messages until their infant was 6 months old. The control group received standard care. Participation, retention, and data completion rates as well as app usage were tracked. Brief semi-structured interviews were conducted with 21 intervention group parents at 6-month follow-up and 10 public health nurses at study completion. Descriptive statistics and thematic analyses were conducted.

Results: For feasibility, the participation rate was 64%, the retention rate was 85%, and the data completion rate was 100%. A total of 26 intervention participants (84%) used the app, and these participants spent a total of 15±14 minutes using the app (27.5 minutes was estimated to complete all app content). Overall, intervention procedures were perceived as feasible by public health staff. For acceptability, there were consistent positive responses from both interviewed parents and public health nurses supporting the following acceptability constructs: perceived effectiveness, affective attitude, ethicality, low burden, opportunity cost, and self-efficacy.

Conclusion: The Early Movers Intervention was observed to be feasible and acceptable. Findings will inform an adequately powered RCT that aims to promote healthy infant movement behaviours and subsequently support optimal development.

O.2.12-8

Maternal Physical Activity Trajectories from Pre-conception to 12 Years Post-delivery and their Associations with Children's 24-hour Movement Behaviour Composition: Findings from the GUSTO Cohort

O.2.12 Children & Families: Early Life Health: Parenting, Movement Behaviors, and Developmental Outcomes, Auditorium, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Patterns of maternal physical activity (PA) across the transition into and throughout motherhood may influence both maternal well-being and children's movement behaviours. However, little is known about how maternal PA evolves from before pregnancy into the second decade of their child's development, or how these long-term trajectories relate to children's PA and sedentary behaviour (SB). This study aimed to identify distinct trajectories of maternal PA from pre-conception to 12 years post-delivery and examine their associations with children's 24-hour movement behaviour compositions at age 12.

Methods: In the Growing Up in Singapore Towards healthy Outcomes (GUSTO) cohort, maternal PA was assessed repeatedly 5 times from pre-conception to 12 years post-delivery using interviewer-administered questionnaires capturing PA intensity, frequency, and duration, from which total MET-hours/week were calculated. Latent growth mixture modelling identified maternal PA trajectories. At age 12, children's 24-hour movement behaviours (SB, light-intensity PA (LPA), moderate-to-vigorous PA (MVPA), and sleep) were measured using wrist-worn accelerometers. Associations between maternal PA trajectories and children's movement behaviours were examined using compositional data analysis, adjusting for maternal and child sociodemographic and anthropometric factors.

ORAL ABSTRACT SESSIONS

Results: A total of 900 women with PA data at three or more timepoints were included in the trajectory analyses; 466 of their children with valid accelerometer data were included in the compositional analyses. Three maternal PA trajectories were identified: consistently low PA (44.1%); high-to-lower PA with higher pre- and early-pregnancy PA that declined over the 12 years following delivery (19.2%); and low-to-higher PA, with initially low PA that increased during the post-delivery (36.6%). Maternal PA trajectory membership was associated with children's overall 24-hour movement composition ($p=0.049$). Compared with children of mothers with consistently low PA, those whose mothers' PA decreased over time accumulated less LPA, more SB, and less sleep per day. No notable differences in MVPA were observed.

Conclusion: Three distinct maternal PA patterns from pre-conception to 12 years post-delivery were identified in our study. These trajectories are associated with children's movement behaviours, underscoring the importance of parental role modelling in promoting children's behaviour during the dynamic parenting years and throughout the life course.

O.2.13-1

Developing a Context-specific Evaluation Framework for Physical Activity and Sedentary Behavior Interventions in Thailand

K. Akksilp^{1,2}, T. Topothai³, W. Mungmee¹, N. Pimsarn⁴, W. Sirichokchatchawan⁵, Y. Teerawattananon¹

O.2.13 Policies and environments: Safe Routes, Food Systems and Power in Local Policy Processes
Room 1, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: To develop and disseminate a Thailand-specific evaluation framework for physical activity and sedentary behavior interventions that is practical for local implementers while also methodologically robust to inform policy and scale-up.

Methods: We executed four sequential phases: (1) synthesized core structures from 13 related international frameworks (e.g., CDC program evaluation framework, NHS Standard Evaluation Framework); (2) conducted Scoping Review and Systematic Review of Thai physical activity and sedentary behavior intervention studies (2014–2024), by searching five international databases (PubMed, Embase, Web of Science, Scopus, Cochrane Library) and Thai databases; (3) co-designed the framework through iterative consultations with national and international experts; and (4) delivered capacity-building and testing of the developed materials via interactive workshops, a web application, and a support system for free rental and training on research-grade accelerometers (e.g., ActiGraph™).

Results: The final guideline integrates elements from 13 frameworks into a coherent pathway of 3 phases and 6 steps, with practical templates for stakeholder mapping, context assessment, theory of change and logic model reconstruction, indicator selection (with SMART examples), data quality checks, and reporting standards aligned to process and outcome evaluation. Analytic guidance emphasizes fit-for-purpose designs (e.g., difference-in-differences for non-randomized settings, cluster designs when appropriate) and explicit causal assumptions. The national literature review ($n = 163$) identified gaps the framework directly addresses: heavy reliance on self-report; limited device-based measurement with pedometers predominating and minimal accelerometer use; scarce formal process evaluation; infrequent long-term follow-up; and absent economic evaluation or scalability planning. The framework, web application, and device-lending/training system were piloted with implementers and evaluators, establishing pathways for routine use of objective measurement and standardized analytic and reporting practices.

Conclusion: By coupling clear evaluation steps with accessible tools (digital platform, device lending, and training), this context-appropriate framework can raise the quality and comparability of physical activity and sedentary behavior evaluations in Thailand. In turn, stronger evidence will better support decision-makers in prioritizing effective interventions and sustaining physical activity and sedentary behavior promotion within constrained public health budgets.

ORAL ABSTRACT SESSIONS

O.2.13-2

Association between Bikeability and Cycling: The Role of Ethnicity (YAHEE Project)

O.2.13 Policies and environments: Safe Routes, Food Systems and Power in Local Policy Processes
Room 1, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Active transport, such as cycling, contributes to an active lifestyle and while the Netherlands is often considered a global benchmark for cycling, evidence on whether all population groups benefit equally from a bike friendly environments (bikeability) is lacking. This study examines ethnic differences in exposure to bikeability and its association with cycling behavior in Amsterdam.

Methods: As part of the Young Adults in Health-enhancing Equitable Environments (YAHEE) project, we used data from 18,916 participants (18-70 years old) from the Healthy Life in an Urban Setting (HELIUS) multi-ethnic cohort (Amsterdam), including 1,990 young adults (18-25 years old). An objectively measured bikeability index, comprising four subcomponents (safety/comfort, attractiveness, directness, coherence), was computed within a 0.5-2.5km residential buffer using data from the Geoscience and Health Cohort Consortium (GECCO). Welch's ANOVA and Tukey HSD post-hoc analyses assessed ethnic differences. Ethnicity-stratified linear regressions examined associations between bikeability(subcomponents) and self-reported commute and leisure cycling (SQUASH-questionnaire), adjusting for sociodemographic factors. Moderation analyses tested education and acculturation effects.

Results: Bikeability differed by ethnicity in both age groups ($p < .001$). Dutch participants were exposed to more bikeable environments; with higher directness and coherence but lower safety/comfort and attractiveness. For commute cycling: higher bikeability related to more cycling in Dutch and African Surinamese participants (e.g., in Dutch $B = 0.51$, $95\%CI = 0.17-0.85$). For leisure time cycling: bikeability was positively related in Dutch, African Surinamese, and Turkish (e.g. African Surinamese $B = 1.44$, $95\%CI = 0.75-2.14$). For the subcomponents directness and coherence were positively associated, whereas safety/comfort and attractiveness were negatively associated, with commute and leisure time cycling, albeit with differences in effect sizes and statistical significance per ethnic group. Education moderated only in Dutch: among young adults effects were stronger for vocational vs higher education groups ($B = 2.15$, $95\%CI = 0.13-4.17$), but weaker with primary/no education in the full sample ($B = -2.92$, $95\%CI = -5.41-0.44$). Acculturation moderated the associations only in African Surinamese young adults: with higher acculturation the association bikeability and cycling was stronger ($B = 8.88$, $95\%CI = 1.31-16.45$).

Conclusion: This study provides evidence of inequities in bikeability in Amsterdam. Findings highlight that infrastructure improvements alone may not increase cycling. Further research is needed to understand which strategies can promote cycling in a multi-ethnic population.

How Can Advocates Leverage Power to Advance Comprehensive Regulation on Ultra-processed Foods? Learning from Advocate Experience in Argentina

S. Wahnschafft^{1,2}, A. Spiller², B.A. Graciano³

O.2.13 Policies and environments: Safe Routes, Food Systems and Power in Local Policy Processes
Room 1, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: The use of corporate power to undermine public health policy processes is increasingly well understood; however, relatively little scholarship examines how advocates can leverage power to promote the successful adoption

ORAL ABSTRACT SESSIONS

of public health policies. The objective of this paper is to explore how advocates leveraged three forms of power – structural, instrumental and discursive – to promote the passage of the Promotion of Healthy Eating Law (Ley 27,642) in Argentina, one of the most comprehensive policies to introduce mandatory front-of-package (FOP) warning labels and regulate the marketing and sales of ultra-processed foods (UPFs) adopted to date.

Methods: We conducted seventeen semi-structured interviews with advocates from different sectors, including civil society, international agencies, and government. Both data collection and analysis were guided by Milsom's conceptual framework for analyzing power in public health policymaking, and the data was analyzed using hybrid deductive and inductive thematic analysis.

Results: Advocates harnessed structural power through the leveraging of revolving doors, informal alliances, and formal coalitions, enabling them to convene discussion spaces with decision-makers, make strategic use of limited resources, and cultivate the diverse expertise (e.g., research, nutrition science, advocacy, law, political science, activism and communications) needed to support the law through different phases of the policy process. Advocates wielded instrumental power by amassing an armada of localized evidence to promote robust policy design, building technical literacy amongst themselves and decision-makers, and exposing conflicts of interest to harness public pressure. Advocates exercised discursive power by adopting a rights-based discourse, including of children and adolescents and of consumers to transparent information, which enabled advocates to foster a favorable perception of the law amongst both decision-makers and the public. Key contextual enablers include a political window of opportunity, the COVID-19 pandemic, and the ability to learn from the regional precedent of similar policies.

Conclusion: Public health policymaking, particularly when encroaching upon corporate interests, is characterized by stark imbalances of power that hinder policy decisions. The strategies identified in the case of Argentina provide important insights as to how advocates might harness and exercise structural, instrumental, and discursive power to counter corporate influence and promote the successful adoption of comprehensive UPF regulation.

O.2.13-4

Evaluation and Prioritization of Food Environment Policies in Türkiye Using the Healthy Food Environment Policy Index (Food-EPI)

O.2.13 Policies and environments: Safe Routes, Food Systems and Power in Local Policy Processes
Room 1, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Türkiye is facing an alarming rise in diet-related non-communicable diseases, with obesity rates anticipated to reach 36%. Tackling this issue demands a more proactive policy approach that fosters healthier food environments and supports long-term dietary improvements. The purpose of this study is to identify and evaluate policies implemented to create healthy food environments in Türkiye, using the Healthy Food Environment Policy Index (Food-EPI) framework.

Methods: The Food-EPI process in Türkiye was carried out in five main stages. First, the domains and indicators included in the tool were contextualized and adapted to the national setting. Second, international benchmarks were compiled, and evidence on national policies was gathered. Third, national experts assessed the implementation level and suggested improvements. Fourth, workshops were held to review results and identify policy gaps. Finally, experts prioritized proposed actions.

Results: None of the food policy or infrastructure support indicators in Türkiye reached a 'high' level of implementation, with half of the policy indicators (50%) and more than half of the infrastructure support indicators (54%) assessed as having a 'low' level of implementation. The two most important policy and infrastructure support actions are as follows, respectively: (1) reducing taxes on healthy and staple foods, (2) supporting healthy, local, and minimally processed food systems through agricultural policies and direct-to-consumer sales; (1) increasing dietitian employment in primary care to enhance nutrition monitoring, and (2) implementing systems to track children's growth, fitness, and eating habits throughout life. According to expert opinions, the implementation of most policy indicators has the potential to create a small reduction in socioeconomic inequalities. However, two policy domains — food promotion and food provision — were identified as having the potential to significantly reduce socioeconomic inequalities.

Conclusion: Türkiye shows weak implementation across several critical areas of food environment policy, including

ORAL ABSTRACT SESSIONS

marketing restrictions, fiscal measures, and healthy food standards in schools and public settings. Without targeted and equity-focused interventions, Türkiye risks missing its health and nutrition goals. Strengthening multisectoral governance and prioritizing vulnerable groups will be essential.

O.2.13-5

Can Safe Routes to School Keep Children Moving? Evidence from the STREETS Project in Austin, Texas, USA

O.2.13 Policies and environments: Safe Routes, Food Systems and Power in Local Policy Processes
Room 1, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Active commuting to school (ACS) can contribute up to 48% of the daily physical activity recommendations for children and adolescents. However, over the past 50 years, ACS rates in the United States have declined dramatically. The *Safe TRavel Environment Evaluation in Texas Schools* (STREETS) project evaluated the effects of a \$27.5 million USD municipal bond investment in Safe Routes to School (SRTS) infrastructure in Austin, Texas, USA, on children's ACS participation and accelerometer-based physical activity.

Methods: Two complementary natural experiments were conducted between Spring 2019 and Spring 2024. A serial cross-sectional study assessed school-level changes in the prevalence of ACS (n=84 schools), and concurrently, a prospective cohort followed children from 3rd to 5th grade (analytic n=275), measuring physical activity levels over time using accelerometers. Exposure was defined by school proximity (<1 mile) to completed SRTS infrastructure projects. Mixed-effects regression models examined associations between SRTS project implementation status in nearby roads to each school (no construction, during construction, completed project(s)) and ACS prevalence (study 1) and child accelerometer-based physical activity (total and MVPA) over time, adjusting for demographic, school, and environmental covariates (study 2).

Results: In both studies, exposure to completed SRTS infrastructure projects was associated with an apparent attenuation of the expected age-related declines in ACS participation and physical activity. During construction periods, temporary declines in school-level ACS participation and accelerometer-based PA were observed. At follow-up, ACS participation in infrastructure schools was attenuated compared to ACS participation in schools without infrastructure ($p < 0.05$). Among cohort participants, children unexposed to infrastructure improvements showed significant declines in total PA and MVPA compared to those attending schools with completed SRTS projects. Children exposed to two or more infrastructure projects exhibited no significant decline in MVPA between 3rd (48.0 min/day; 95%CI: 46.2, 49.9) and 5th grade (40.2 min/day; 95%CI: 32.3, 48.0).

Conclusion: Large-scale SRTS infrastructure investments may mitigate age-related physical activity declines by supporting ACS. While short-term construction disruptions can reduce activity, longer-term exposure to completed infrastructure appears protective. Findings highlight the importance of longer-term follow-up periods in natural experiment evaluations to fully capture the possible benefits of built environment transformations on child travel-related behaviors.

¹Tilburg University, Communication and Cognition, Tilburg, Netherlands, ²Tilburg University, Department of Marketing, Tilburg, Netherlands, ³Questionmark Foundation, Amsterdam, Netherlands

O.2.13 Policies and environments: Safe Routes, Food Systems and Power in Local Policy Processes
Room 1, May 29, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Food environments influence food choices, and the digital transition has increasingly shifted food purchasing to digital food environments, like supermarket apps and meal delivery services. Robust indicators are essential for accurately assessing exposure to unhealthy food environments, understanding associations with health outcomes, and informing policy. While indicators are well developed for physical supermarkets and for online assortment and promotions, indicators for digital *choice architecture* are only beginning to emerge. This project aimed to develop indicators for digital food choice environments and to assess the extent to which the online supermarket landscape in the Netherlands supports healthy food choices.

Methods: Two observational substudies using an indicator-based analysis of major online supermarkets, were conducted. Drawing on the choice architecture framework (Münscher et al., 2016), we iteratively developed indicators reflecting decision information, structure, and assistance. In substudy 1, a broad set of indicators covering eight app functionalities was employed. In substudy 2, we focused more narrowly on the search and checkout functions using a granular set of indicators. Data were collected in November 2024 and April-May 2025.

Results: For substudy 1, across all indicators, online supermarkets generally favoured unhealthy over healthy products. For example, on product-pages, recommended products were often unhealthy, only one supermarket allowed filtering recipes by healthiness, and hedonic visual cues were more common than healthy ones. In Substudy 2, 3/4 of supermarkets recommended products at checkout. Although the top product in the checkout was always healthy (66.7%) or non-food (33.3%), the overall nutritional profile of recommended products was skewed: 52.7% were unhealthy, 34.7% healthy, and 12.5% non-food. A similar pattern emerged in the search function. While healthy products appeared more often in the top half of the search results ($M=2.3$, $SD=2.2$) compared to the lower half ($M=1.7$, $SD=2.0$), the majority of products returned were still unhealthy. Inter-rater reliability and stability over time were high (Krippendorff's α 's and ICC's > 0.9).

Conclusion: Both substudies show that online supermarkets generally promote unhealthy over healthy products, mirroring patterns seen in physical supermarkets. The indicators proved to be reliable and stable across time points, confirming the indicators' suitability for longitudinal and comparative research.

O.2.13 Policies and environments: Safe Routes, Food Systems and Power in Local Policy Processes

Room 1, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Despite growing attention to local food policies as a means to transform unhealthy food environments, little is known about how these policies make their way into municipal agendas. This study compares municipalities within the Dutch *City Deal: Healthy and Sustainable Food Environment* to understand why some succeed in placing food strategies and zoning regulations on the agenda while others do not.

Methods: Using Kingdon's Multiple Streams Framework (MSF), we conducted a qualitative comparative case study of ten Dutch municipalities. Interview data from 14 policymakers and policy documents were coded according to the MSF streams and analysed to explore how and through which mechanisms the theoretical expectations of the framework were reflected in local policy processes. We examined whether and how hypothesised conditions, such as problem recognition, feasibility and acceptability of the policy and changes in the political environment, were realised across municipalities.

Results:

Six municipalities adopted a local food strategy. Rising obesity rates, health inequalities, and unsustainable food systems framed the food environment as a public issue, though in some cases it was also viewed as an economic opportunity. Political attention often depended on the presence of an alderman responsible for food, while strategies linked to broader health or sustainability agendas benefited from existing capacity and resources. In contrast, municipalities without a strategy lacked urgency, clear framing, or leadership, and some considered the topic too politically sensitive.

ORAL ABSTRACT SESSIONS

No municipality had fully adopted zoning policies, but four were experimenting with restrictions or advertising rules. In these municipalities, policy and political entrepreneurs successfully framed fast-food dominance as a threat to health, spatial quality and local economy, mobilising support for regulatory action. Elsewhere, perceived legal uncertainty and fears of paternalism prevented progress despite technical options being available.

Conclusion: The MSF provided an useful analytical lens to examine how theoretical expectations of agenda-setting manifest in practice. Findings largely confirmed these expectations: successful agenda-setting depended on the alignment of issue framing, institutional capacity, and political culture. For zoning policies, ideological alignment and framing strategies were particularly influential, indicating that addressing perceptions of paternalism is essential for advancing regulatory measures.

O.2.14-1

Staying on Track: Exploring Experiences and Needs to Sustain Healthy Behavior after a Lifestyle Intervention

A. Ronteltap¹, F. Meester¹, B. Dorhout¹, D. Bossen², K. Braam³, D.-J. Barten¹

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: The rise in non-communicable chronic diseases calls for effective support of healthy lifestyle behaviors. Combined lifestyle interventions (CLI), aimed at reducing weight-related health risks through behavior change, seem successful in initial behavior change. However, sustaining healthy lifestyle behaviors after completing lifestyle interventions remains challenging. This study explores the experiences and needs to sustain healthy behavior after a lifestyle intervention of CLI providers and individuals who successfully completed a CLI in the Netherlands.

Methods: We conducted semi-structured online interviews with 17 adults who successfully completed a CLI. Additionally, four focus groups (three onsite, one online) were held with 22 CLI providers representing various CLI-programs and professional backgrounds. Data were audio-recorded, transcribed verbatim, and thematically analyzed using an iterative, inductive approach.

Results: In the interviews, participants highlighted the crucial role of social support in sustaining healthy behaviors after CLI, such as continued peer contact in informal meetings or sport groups. Participants emphasized the need for ongoing guidance after a CLI, through brief follow-ups, either in person or digitally. Participants expressed a preference for accessible, interactive support tools combining personalized feedback, social connection, and reminders, introduced during the CLI itself. In the focus groups, CLI-providers indicated to be available for ongoing support, but only at the initiative of participants. Both respondent groups mentioned digital tools as potentially helpful in post-CLI behavior maintenance, including apps for communication (chat or video calling), and for behavior tracking (physical activity, dietary habits, or emotional well-being). CLI-providers mentioned systemic barriers to provide support after CLI, including lack of structural funding, a shared national approach, and lack of collaboration between CLI-providers.

Conclusion: Sustaining healthy behaviors after CLI requires accessible, socially embedded, and personalized support. Guided peer interaction, self-monitoring tools, and brief in-person or digital follow-ups can enhance long-term maintenance. Addressing systemic barriers, including fragmented post-CLI support and lack of national coordination, is crucial. Findings will be used in a follow-up study into the design of a digital support tool for maintenance of healthy behaviors.

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Adolescence is a period in which body image satisfaction (BIS) gains relevance and may influence lifestyles, with possible effects on cardiovascular health (CVH). The study aims to evaluate the relationship between BIS and CVH using the Life's Essential 8 (LE8) score over adolescence.

Methods: 1321 adolescents from the SI! Program for Secondary Schools trial were assessed at baseline (12.5 [±0.4] years, 48.4% girls), and after 2- and 4- years follow-up. Validated questionnaires were used for assessing BIS, diet and nicotine exposure. Validated tools were used to measure physical activity, sleep time, height, weight and blood pressure. Capillary blood samples were collected in fasting status to measure blood glucose and lipids. Associations were estimated using linear and logistic mixed models stratified by gender, and adjusted for age, educational level, migrant background, and randomization group as fixed effects, and region and schools as random effects.

Results: At age 12, adolescents desiring to lose weight (DTL) showed the lowest LE8 CVH score (76.4 [± 9.5]) compared to body-satisfied adolescents (82.0 [± 7.2]) and to those desiring to gain weight (DTG) (83.0 [± 8.0]). 53.3% of adolescents presented ideal CVH, but the proportion varied according to BIS (satisfied: 65.8%; DTL: 38.6%; DTG: 69.3%). After a 4-years follow-up, CVH significantly worsened, with a larger impairment in adolescents DTL (-4.1 [95% CI: -5.0; -3.2]), compared to body-satisfied participants (p-value: 0.014). In gender-stratified analysis, similar differences were observed for boys DTL (-4.7 [95% CI: -5.9; -3.4]). Between-groups differences in LE8 impairment over time were mainly driven by a larger impairment in physical activity among adolescents DTG and by worse blood pressure scores among those DTL, compared to body-satisfied adolescents.

Conclusion: BIS was consistently associated with CVH throughout adolescence, with a better CVH in body satisfied adolescents, and with a worse cardiovascular profile in adolescents DTL. Health promotion programs targeting adolescents should reinforce body image acceptance, considering its association with healthy lifestyle behaviors, beyond weight status.

ORAL ABSTRACT SESSIONS

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: To describe longitudinal trajectories of light physical activity (LPA), moderate-to-vigorous PA (MVPA), sedentary behaviour (SB), and screen viewing time (SVT) in Singaporean children aged 2–6 years and identify key socio-demographic predictors.

Methods: We used data of 325 children included from birth as part of the S-PRESTO cohort in Singapore. At ages 2, 3 and 6, parent reported LPA, MVPA, SB, and SVT using questionnaires. Population-averaged generalized estimating equations (GEE) with an exchangeable correlation structure, and robust standard errors were used. Models were adjusted for school year, sex, ethnicity, and maternal age, education, BMI, and SVT.

Results: Mean (95% CI) total PA time increased from 198.3 min/day (194.6–202.1) at Year 2 to a peak of 471.9 min/day (467.5–476.4) at Year 3, then declined to 188.8 min/day (184.7–192.8) by Year 6. LPA and MVPA followed similar trajectories, peaking at Year 3 (LPA: 356.9 min/day (353.4–360.5); MVPA: 115.0 min/day (113.3–116.7)). SB showed a U-shaped pattern, decreasing from 496.0 min/day (491.0–500.9) at Year 2 to 355.0 min/day (350.5–359.4) at Year 3, then increasing to 441.7 min/day (436.8–446.6) by Year 6. SVT rose steadily from 82.6 min/day (80.2–84.9) at Year 2 to 132.8 min/day (130.1–135.5) at Year 6.

Adjusted models showed lower daily LPA time in girls ($\beta = -18.3$ [-34.8, -1.8] min/day) and higher in non-Chinese children (+26.7 [6.1, 47.4] min/day). MVPA was higher among non-Chinese (+16.5 [6.4, 26.5] min/day) and children of mothers with overweight/obesity (+11.5 [0.1, 22.8] min/day). SB was higher in non-Chinese children (+52.3 [18.6, 86.0] min/day). Daily SVT was greater in non-Chinese children (+32.0 [13.5, 50.5] min/day) and increased with higher maternal SVT (>180 min/day; $\beta = +15.2$ [1.1, 29.4] min/day), BMI (+23.1 [5.7, 40.5] min/day), and age (+2.54 [0.3, 4.8] min/day per year), but was lower with maternal university education (-45.5 [-63.9, -27.2] min/day).

Conclusion: Our study shows that Singaporean preschool children experience important changes in movement behaviours. Those changes are predicted by child sex and ethnicity, maternal education and BMI. Interventions should target the critical Year 3–4 transition and promote parental role-modelling.

O.2.14-4

Effectiveness of Integrating a Lifestyle Front Office in Hospital Care for Patients with Lifestyle-related Diseases: The LOFIT Randomised Controlled Trial

J. Jelsma¹, M. van Dijk¹, I. van den Akker-Scheek², A. Bouma², R. Dekker², A. Driessen¹, L. te Loo¹, C. Schumacher², H. van der Ploeg¹, W. van Mechelen¹, J. Vrijsen², on behalf of the LOFIT Consortium

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: In many clinical guidelines lifestyle medicine is recommended as treatment option for diverse noncommunicable diseases. However, healthcare professionals experience barriers such as limited time, lack of skills and lack of knowledge to implement this in usual practice. Therefore, in the Netherlands, lifestyle front offices were integrated in hospital care for patients with lifestyle-related diseases to facilitate tailored lifestyle counselling and referral to community-based lifestyle initiatives. The LOFIT study aims to evaluate the effectiveness of implementing these lifestyle front offices in hospital care on a composite lifestyle and health risk outcome.

Methods: A pragmatic randomized controlled trial was conducted among patients recruited from three outpatient clinics in the Netherlands. Patients with (an increased risk for) cardiometabolic or musculoskeletal disorders and aged ≥ 18 years were eligible. Further inclusion criteria comprised BMI ≥ 25 kg/m² and/or current smokers. Patients were randomized to either the intervention or a usual care group. The intervention consisted of a face-to-face motivational interviewing session with a lifestyle broker, who motivated and supported patients in identifying and accessing suitable community-based lifestyle initiatives. The primary outcome was the adapted Fuster-BEWAT score at 12 months, a composite health and lifestyle measure comprising resting systolic and diastolic blood pressure, objectively measured physical activity and sedentary time, body mass index, fruit and vegetable intake, and smoking behavior. Analyses followed the intention-to-treat principle, using mixed-effects models to evaluate between-group differences over time, adjusted for baseline values.

Results: Between April 2022 and May 2024 a total of 740 patients were assessed for eligibility. Of these 415 (56%)

ORAL ABSTRACT SESSIONS

were excluded, and 325 were randomly assigned (162 to the intervention group and 163 to the no treatment control group). 52% of the patients were women and the mean age was 54.0 years ($\pm$ SD 12.9). The intervention was effective and showed a significant improvement in the health risk and lifestyle score (0.74 95%CI 0.06 to 1.42).

Conclusion: This study provides evidence on the effectiveness of an integrated hospital- and community-based lifestyle care model. A lifestyle front office is a scalable strategy to embed lifestyle medicine within routine hospital care, promoting sustainable health behavior change and improved clinical outcomes.

O.2.14-5

The Impact of Taxation, Subsidies, and Warning Messages on Consumers' Healthy and Sustainable Online Food Purchases

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Excessive red and processed meat (RPM) consumption in Belgium poses environmental and health risks, while fruit, vegetable, and legume (FVL) intake remains insufficient. Traditional interventions such as labeling yield limited effectiveness, while fiscal policies have shown mixed results. This study investigates whether combining fiscal interventions (taxes on RPM, subsidies on FVLN) with FoP warning labels (health, environmental, or combined) promotes healthier, more sustainable food choices among Belgian consumers, and whether eco-anxiety moderates intervention effectiveness. This research innovatively evaluates comparative and combined effects of fiscal and informational interventions in an incentive-compatible virtual supermarket, providing ecologically valid insights into behavioral mechanisms underlying sustainable dietary shifts.

Methods: A 4 (Warning Message: Control, Health, Environment, Combined) $\times$ 2 (Fiscal Policy: Absent vs. Present) between-subjects design was implemented with 3200 Belgian adults. Participants completed three-day online grocery shopping in an incentive-compatible virtual supermarket replicating Belgian retailers with over 10,000 products. Fiscal intervention: 30% tax on RPM, 30% subsidy on FVL. Outcomes included purchase probability, quantity (grams), spending (€) for RPM and FVL, nutritional quality, and basket CO₂ emissions. Eco-anxiety was examined as a moderator.

Results: Fiscal interventions consistently reduced probability and grams of RPM purchases while increasing FVL gram purchases. These interventions altered spending patterns, with higher per-buyer spending on RPM and lower spending on subsidized FVL. Combined fiscal and warning messages yielded largest improvements across purchase behavior, nutritional quality, and environmental outcomes, including lower CO₂ emissions from RPM and higher emissions from FVL. Warning messages alone had minimal or inconsistent effects. Eco-anxiety significantly amplified the effects of fiscal intervention: participants with higher eco-anxiety showed larger reductions in RPM purchases, stronger shifts in spending, although it did not consistently influence overall nutritional quality or total basket CO₂ emissions.

Conclusion: Fiscal interventions outperform warning labels alone, with combined strategies producing comprehensive improvements. Findings demonstrate how economic incentives integrate with behavioral insights to shift dietary behavior. Eco-anxiety's moderating role suggests emotional engagement enhances intervention effectiveness. Methodologically, the research demonstrates utility of incentive-compatible virtual supermarkets for ecologically valid behavioral experiments. Results support implementing taxes on red/processed meat and subsidies for FVLN, showing combined strategies meaningfully promote sustainable diets at population level.

ORAL ABSTRACT SESSIONS

O.2.14-6

Effects of a Two-year Primary Care Behavioural Lifestyle Intervention on Weight Loss among Patients with Obesity and Prediabetes

P. Katzmarzyk¹, K. Denstel¹, E. Mire¹, C. Martin¹, J. Apolzan¹, R. Newton¹

¹Pennington Biomedical Research Center, Baton Rouge, United States

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: The purpose was to determine the effectiveness of treatment for obesity delivered in primary care on weight loss among adults with obesity and prediabetes.

Methods: Eighteen primary care clinics participated in the Promoting Successful Weight Loss in Primary Care in Louisiana (PROPEL) cluster randomized trial. Clinics serving primarily low-income patients were randomized to a 24-month intensive lifestyle intervention (ILI) for weight loss or to usual care (UC). Patients in the ILI participated in a high-intensity behavioural program focused on reduced caloric intake and increased physical activity delivered by health coaches embedded in the clinics. Patients in the UC group received their usual care from their healthcare providers. Percent weight loss from baseline was calculated at months 6, 12, 18 and 24 months, and differences between groups were tested using linear mixed-effects multi-level models including age, sex and race as covariates, and included random cluster (clinic) effects.

Results: The full sample in the PROPEL trial included 803 adults. The analytic sub-sample included in the present analysis consisted of 174 patients (99 ILI; 75 UC) with obesity (BMI ≥ 30 kg/m²) and prediabetes (fasting glucose 100 – 125 mg/dL with no diagnosis of diabetes). A total of 86% of the sample were female and 64% were African American. The mean (SD) age and BMI at baseline were 50.8 (11.9) y and 37.6 (4.6) kg/m², respectively. At 24 months, weight change in the ILI was -5.09% (95% CI: -6.87, -3.31) compared to 0.02% (-1.84, 1.88) in the UC group. The mean difference between the two groups for weight loss was -5.11% (-7.48, -2.75%; $p < 0.0001$). Similarly, the mean difference between the two groups for change in waist circumference was -4.74 cm (-6.96, -2.52; $p < 0.0001$) favouring the ILI group.

Conclusion: A behavioural lifestyle intervention consistent with current guidelines was effective at producing clinically significant weight loss over 2 years in a high-risk, underserved population with obesity and prediabetes.

O.2.14-7

Effect of the RISE Intervention on 24-hour Movement Behaviour in People with First-ever Stroke: A Randomized Controlled Trial

C.F. Biemans^{1,2,3}, S.A. Pagen^{1,2,3}, S. Broers^{2,3}, W. Hendrickx^{1,2,3}, R. Study Group², C. English⁴, O.W. Verschuren^{1,2,5}, C. Veenhof^{2,6}, J.M. Visser-Meily^{2,5}, Y.A. Hartman^{1,2,3}, M.F. Pisters^{1,2,3}

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: A balanced 24-hour movement behaviour (sedentary behaviour (SB), physical activity and sleep) is expected to reduce the risk of a new major cardiovascular event or mortality (MACE) after stroke. This study evaluates the effectiveness of the RISE (*Reduce and Interrupt Sedentary behaviour using a blended behavioural intervention to Empower people at risk towards sustainable 24-hour movement behaviour change*) intervention on changes in 24-hour movement behaviour in community dwelling people with a first-ever stroke and high-risk sedentary profile, compared to usual care.

Methods: In this randomized controlled trial (N=119), participants were randomly assigned to either the *experimental*

ORAL ABSTRACT SESSIONS

group (RISE intervention and usual care) or the *control group* (usual care). RISE is a 15-week blended care intervention: primary care physiotherapists coach people in their home setting using behaviour change techniques and the RISE eCoaching system. This system consists of: (1) an activity monitor, (2) a smartphone application that provides real-time feedback and contains e-learning modules and (3) a monitoring dashboard for the physiotherapist. A close relative of the participant is involved during the intervention to provide social support. The primary outcome was change in 24h movement behaviour (short SB (<30 minutes), prolonged SB (≥30 minutes), light physical activity (LPA), moderate to vigorous physical activity (MVPA) and sleep), objectively measured with accelerometers at baseline (T0) and post-intervention (T1). Compositional data were expressed as proportions of a 24-hour day and transformed into isometric log-ratio (ilr) coordinates to account for the co-dependency of 24-hour data. Changes in ilr-coordinates (T1-T0) were analyzed using multivariate analysis of variance (MANOVA) and follow-up univariate tests. Perturbation-based compositional differences were visualized using ternary plots.

Results: Complete dataset and analyses will be available at the end of 2025.

Conclusion: We anticipate that the RISE intervention will improve the 24-hour movement behaviour composition by replacing short and prolonged SB with LPA or MVPA, demonstrating that a 24-hour behaviour change is achievable through a 15-week blended behavioural intervention. If confirmed, these changes could contribute to secondary prevention of MACE in individuals after a first-ever stroke.

O.2.14-8

Development and Pilot of a Healthcare Professional Training Programme on 24-hour Movement Behaviours in Multiple Long-term Conditions

O.2.14 Motivation and behaviour change: Advancing Care and Prevention: Strategies for Movement and Dietary Behaviors

Room 2, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: We aimed to develop and pilot test a theory and evidence-based training programme for HCPs focused on supporting 24-movement behaviours (physical activity, sitting time and sleep) in people living with multiple long-term conditions (MLTCs).

Methods: Intervention Mapping (IM) guided the programme development. Literature review data (n=23 articles), five qualitative focus groups with HCPs (n=31), and two Patient and Public Involvement groups informed the needs assessment step of IM. Determinants of HCP behaviour were mapped to Behaviour Change Techniques (BCTs) and applied to the training. A collaborative, multidisciplinary group developed the training curriculum and materials. Training was pilot tested as a one-day, free course with a pre-post and 3 month follow up mixed-method online survey measuring participants self-rated knowledge of movement behaviours, self-efficacy in behaviour change, and Shared Decision Making (SDM) skills (SDM-Q-Doc-9). Pre-post results were analysed using the Wilcoxon Signed Ranks T-Test and content analysis of free-text responses.

Results: The needs assessment found that HCPs require knowledge on 24-hour movement behaviours and guidelines, skills in communication and SDM, and self-efficacy in behaviour change (e.g. action planning) to support people with MLTCs with 24-hour movement behaviours. These topics were incorporated into the training and resource pack with BCTs to change HCPs knowledge, skills and self-efficacy (e.g. behavioural practice).

Twenty-two HCPs attended the training (67%); 12 (54%) completed pre and post-training surveys and 9 (41%) completed follow-up surveys. Participants mean age was 44 (SD=12.4) and median years of experience was 3.5 (IQR=2.6-8.0). Following training, increases were found in SDM skills scores (mean=60±80), knowledge across all movement behaviours (from reasonable to good), and self-efficacy in behaviour change (from slightly or moderately confident to very confident), except planning. Qualitative responses indicated that the practice-based components were particularly valuable, however that the training could be improved with less repetition and shorter breaks to maintain engagement. Follow-up results are currently being analysed.

Conclusion: We developed and delivered a theory and evidence-based training programme to enhance HCPs knowledge, skills and confidence to support 24-hour movement in MLTCs. Further research should refine the programme and evaluate its impact on clinical practice and patient outcomes.

ORAL ABSTRACT SESSIONS

O.2.15-1

Harmonising Sociodemographic Variables and Behavioural Outcomes for Individual Participant Data Meta-analysis: A Case Study in Early Childhood Obesity Prevention

K. Hunter¹, D. Nguyen¹, S. Libesman¹, J. Williams¹, J. Aagerup^{1,2}, B. Johnson³, A.L. Seidler², TOPCHILD Collaboration
¹University of Sydney, NHMRC Clinical Trials Centre, Sydney, Australia, ²Universitätsmedizin Rostock, German Center for Child and Adolescent Health (DZKJ), Rostock, Germany, ³Flinders University, College of Nursing and Health Sciences, Caring Futures Institute, Adelaide, Australia

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Outcomes assessing obesity-related behaviours, such as diet, feeding, physical activity, and sleep are often defined, measured and collected differently across trials, limiting the ability to compare and synthesise evidence. Similarly, sociodemographic data, such as ethnicity, education, and employment are often collected heterogeneously, precluding examination of health equity issues. We aimed to develop methods to harmonise variables and outcomes in a large systematic review and individual participant data (IPD) meta-analysis of early childhood obesity prevention interventions commencing during pregnancy or <12 months after birth.

Methods: We established the Transforming Obesity Prevention for Children (TOPCHILD) Collaboration, comprising over 70 researchers across 47 institutions. Investigators from 31 randomised trials evaluating parent-focused behavioural interventions for early child obesity prevention shared their line-by-line IPD and accompanying codebooks, generating a large dataset of 28,825 participants. To derive a process for harmonising these data, we conducted a literature review, drew on experiences from previous IPD and prospective meta-analyses, and consulted experts in the field, including members of the Cochrane Prospective Meta-Analysis Methods Group and the SMART-IPD Methods Group.

Results: We developed a step-by-step process for harmonisation:

1. **Collation:** Collecting detailed information on variables and outcomes across eligible trials, including definitions, measures, and timepoints.
2. **Mapping:** Aligning trial-specific data to TOPCHILD target variables to assess equivalence.
3. **Standardisation:** Using algorithmic transformations (e.g. recoding categories), unit calibration (e.g. pounds to kilograms), and score rescaling to achieve comparability.
4. **Consensus:** Conducting workshops with topic experts to decide on standardisation rules while preserving scientific validity.
5. **Documentation:** Recording all decisions and rules transparently.
6. **Application:** Re-coding datasets for analyses and sharing harmonised variables with ongoing trials to promote prospective harmonisation.

Harmonisation across trials enabled high-quality evidence generation on intervention effects on child weight status, breastfeeding, diet, physical activity, and sleep. Harmonised sociodemographic data also facilitated subgroup analyses to explore equity-related differences in intervention effects.

Conclusion: Our harmonisation framework supports the standardisation of behavioural and sociodemographic variables in early childhood obesity prevention research using IPD. Applying these methods enhances statistical power, precision, and validity, enabling more robust evidence to inform policy and practice.

¹Karolinska Institutet, Department of Medicine, Huddinge, Huddinge, Sweden, ²Linköping University, Department of Health, Medicine and Caring Sciences, Linköping, Sweden

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Research investigating associations between movement behaviours and physical fitness using compositional data analysis in preschool children is scarce and to date only one other study has examined the full 24-hour day. Therefore, the aim of this study is to investigate associations of vigorous physical activity (VPA) and moderate-to-vigorous physical activity (MVPA) with physical fitness in 3–6-year-old children.

Methods: This study utilized cross-sectional data from the Swedish arm of the SUNRISE study ($n=631$). Physical activity and sedentary behaviour were assessed using waist-worn ActiGraphs following a seven day 24-hour protocol and sleep was assessed in the parental questionnaire. Physical fitness tests included: 20m shuttle run (cardiorespiratory fitness), handgrip strength (upper body muscular strength), standing long jump (lower body muscular strength), and supine-timed up and go (mobility and posture). Linear regression models were built using compositional data analysis standards.

Results: Reallocating time to VPA relative to the lower-intensity behaviours was associated with jumping longer ($\beta = 15.668$, $P < 0.001$), a stronger handgrip ($\beta = 1.547$, $P < 0.001$), and running more laps in the 20-m shuttle run ($\beta = 2.503$, $P = 0.011$). Similar results were also found for reallocating time to MVPA relative to the lower-intensity behaviours, where significant associations were observed with jumping longer ($\beta = 26.552$, $P < 0.001$), a stronger handgrip ($\beta = 2.114$, $P < 0.001$), running more laps on the 20-m shuttle run ($\beta = 3.883$, $P = 0.002$), as well as a faster time on the supine-timed up and go ($\beta = -0.952$, $P = 0.002$). Magnitudes of effects were larger for VPA than MVPA.

Conclusion: These findings highlight the importance of promoting higher intensity activities, especially VPA in early childhood for physical fitness. There is a need for prospective studies with large samples sizes, along with rigorously designed randomized controlled trials with a range of health outcomes to determine whether VPA plays a more significant role than MVPA in relation to preschool children's health. This could help in supporting future physical activity guidelines in the early years.

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Healthy and sustainable eating behavior is essential for health and environmental sustainability, yet children often fail to meet dietary recommendations. School-based nutrition education aims to enhance children's food literacy and favorable eating behaviors. A wide array of studies has evaluated nutrition education programs on various outcomes and showed various effects. This study mapped existing evidence on the effectiveness of nutrition education in childcare and school settings, and promising strategies for implementation of these interventions.

Methods: A review of reviews was conducted, including reviews that were published in the past decade. The search was conducted in PubMed and Scopus, focusing on nutrition education programs, food policy, and food provision in childcare or school settings in Western countries for children up to 18 years old. After title and abstract screening, 41 reviews from 322 unique search results were analyzed. An expert consultation was organized with 15 professionals from science, policy, and practice to validate the findings and discuss success factors for implementation.

Results: Most reviews reported positive effects on behavioral determinants (particularly on knowledge and self-efficacy) and dietary behaviors (particularly fruit and vegetable consumption). Effects on health-related outcomes, such as BMI, were less frequently assessed and inconsistent, with most often positive effects when nutrition education was combined with physical activity. Effects were generally small and often assessed on the short-term, limiting insights into long-term impact. Promising intervention strategies of effective interventions were multi-component strategies, combining experience-based activities (e.g., cooking and tasting), changing in the food provision, and active parental involvement. Moreover, theoretical grounding, a longer intervention duration, contextual adaptation, stakeholder involvement, and training of implementers increased the likelihood of effectiveness. Implementation barriers were related to intervention complexity, organizational constraints, and insufficient policy support.

Conclusion: School-based nutrition education is mainly effective in increasing behavioral determinants and eating behaviors of children and adolescents. Multi-component, context-sensitive, sustained approaches including

ORAL ABSTRACT SESSIONS

experiential learning methods showed the largest effects. Structural implementation of nutrition education across all settings and age groups, supported by adequate resources, is therefore recommended.

O.2.15-4

Impact of a Family-based Early Childhood Intervention on Self-efficacy and Resilience for Obesity Prevention: Results from a Cluster Randomized Controlled Trial

P. Berrueto^{1,2}, G. Según^{1,3}, S. Torres^{1,4}, G. Valdés-Querol¹, G. López-Iglesias¹, M. Franco^{5,6,7}, S.F. Gómez^{1,3,8}

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Early childhood is an essential period for shaping lifelong health trajectories, yet socioeconomic inequalities increase obesity risk. Parents and caregivers play a central role in establishing healthy behaviours, but evidence on effective interventions remains mixed. The primary aim of the study is to evaluate whether a family-based intervention can strengthen parental self-efficacy and resilience, which may, in turn, foster healthier behaviours in children and prevent obesity in later stages. This study is innovative as it addresses the psychosocial determinants of obesity among socioeconomically disadvantaged preschool children.

Methods: PRESAFALIN was conducted as a 1:1 cluster randomized controlled trial with a 10-month intervention across 115 early childhood centres in Spain (2020–2024). Ethics approval number: PIC-238-20; Trial registration: ISRCTN15553317. A total of 1,020 parents/caregivers of children under 5 years participated (546 intervention, 474 control). Parental self-efficacy (total and four subdimensions: Care, Signalling, Behavior, Belief) and resilience were assessed using validated self-report questionnaires. Baseline comparability was examined using univariate analyses. Intervention effects on continuous and binary outcomes were estimated with mixed-effects linear and logistic models, adjusting for sociodemographic factors and clustering by centre. Analyses were conducted in R 4.5.1 using two-sided tests with a 5% significance level.

Results: Bootstrap analyses of adjusted models confirmed significant group-by-time interactions for Self-efficacy_Total ($\beta = 1.57$, 95% CI [0.86, 2.21]), Self-efficacy_Behavior ($\beta = 0.78$, 95% CI [0.46, 1.11]), Self-efficacy_Signalling ($\beta = 0.53$, 95% CI [0.29, 0.76]), and Self-efficacy_Belief ($\beta = 0.22$, 95% CI [0.08, 0.34]). Logistic regression analyses confirmed significant short-term improvements in Self-efficacy_Total (OR = 1.43, 95% CI [1.06–1.94], $p = 0.019$) and Self-efficacy_Behavior (OR = 1.45, 95% CI [1.05–2.01], $p = 0.024$; $n = 690$). The remaining outcomes showed favourable but non-significant trends.

Conclusion: PRESAFALIN demonstrates that family-based interventions can effectively strengthen parental self-efficacy and resilience in the short term. Planned follow-up assessments will evaluate the sustainability of these effects, as well as their impact on health behaviours and weight status trajectories in the medium and long term. This intervention is designed to be scalable through national public health policies if the positive outcomes are maintained.

O.2.15-5

Mealtimes Are More Than Food: Fostering Inclusive Practices and Meaningful Conversations in Early Childhood Education and Care Settings

A. Elford¹, L. Clark¹, C. Ihlein¹, A. Devine¹, R. Sambell¹

¹Edith Cowan University, School of Medical and Health Sciences, Perth, Australia

ORAL ABSTRACT SESSIONS

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Approximately 50% of Australian children aged birth-5 years attend Early Childhood Education and Care (ECEC), therefore these settings can be seen as “proxy homes” for children. Early mealtime experiences not only influence lifelong eating habits but can also foster connection and broaden learning. Yet current guidance largely focuses on food provision rather than the broader social and pedagogical dimensions of mealtimes. The purpose of this study was to explore how ECEC staff and assessment-and rating-officers (AROs) of ECEC perceive and enact mealtime environments and practices.

Methods: Five 90-minute online focus groups were conducted with ECEC Educators, Cooks, Directors, and AROs across Western Australia via Microsoft Teams. Purposive sampling ensured representation from privately owned and community-based services, family day care, and services located in metropolitan, regional, and remote areas. All sessions were recorded, transcribed verbatim, and analysed using an inductive thematic approach with NVivo.

Results: Data collection concluded in September 2025. Twenty-seven participants included Directors (n = 9), Educators (n = 6), Cooks (n = 5), and AROs (n = 7). Preliminary findings outlined four major themes: i) Mealtimes are more than food — they should be calm, positive, and inclusive, with reduced noise, fostering comfort and connection for all children, including those who are neurodivergent; ii) Current mealtime practices were shaped by personal experience and peer learning, with staff requesting concrete and practical guidance; iii) Conversations at mealtimes typically centred on food rather than supporting social connection or broader learning; iv) Staffing ratios and allergy management requirements constrained positive shared mealtime experiences.

Conclusion: Mealtimes can be a powerful relational and pedagogical opportunity. Findings highlight practical, high impact levers. There is an opportunity to guide ECEC services in supporting safe mealtimes beyond food quality, developing practices and conversations that foster connection and broader learning. These insights are being translated into a co-designed “Mealtime Environment and Practices” module (theme one of five), for the Best Practice Guide for food environments in ECEC with ECEC staff, health and clinical practitioners including allergy specialists, and trauma-informed experts, ensuring inclusive, emotionally safe mealtimes practices are fostered.

O.2.15-6

Effectiveness of Three Years of Classroom-based Physical Activity Interventions on Executive Functions in Schoolchildren: A Cluster Randomized Trial

J.C. N. Melo¹, E.C. M. Silva², J. Ywgne³, L. Gandarela³, D. N. Oliveria⁴, J. Caldas³, J.A.I. R. S. Sampaio⁴, J. Tejada⁵, D. R. Silva⁶

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Physically active lessons (PAL) and physically active breaks (PAB) can reduce sedentary behavior in children, but their medium- and long-term effects on executive functions remain unclear. This study examined the impact of three-year PAL and PAB interventions on schoolchildren's executive functions.

Methods: A total of 324 children (7.5±1.1 years; 51.5% girls) from six public schools in Aracaju/Brazil, participated in a study from 2022 to 2024. Schools were randomized into three groups: PAL, integrating movement into academic content; PAB, short breaks involving physical activity; and control (CTL). Executive functions were assessed using reaction time (RT) and total correct responses (CR) in the Go/No-Go (inhibitory control), Digit Span (short-term memory), Mental Rotation (spatial reasoning), Visual Search (selective attention), and Posner Cueing (orienting attention) tasks. Generalized Linear Mixed Models were applied.

Results: Significant group-by-time interactions were observed for the inhibitory control (RT, p =0.001), spatial reasoning (RT, p=0.003), and orienting attention (RT, p=0.003). In the inhibitory control, only the PAB group showed a significant RT improvement after three years (-151.6 ms; p <0.001), whereas the PAL group improved only in the

ORAL ABSTRACT SESSIONS

first year (-79.2 ms; $p=0.001$). In the spatial reasoning, all groups reduced RT after three years: PAL (-3794.4 ms), PAB (-2748.4 ms), and CTL (-2602.9 ms), all $p<0.001$, with only PAL and PAB improving in the first year ($p<0.001$). Difference-in-differences analyses showed greater reductions for PAL at the end of year three compared with CTL ($p=0.013$) and PAB ($p=0.026$). In the orienting attention, all groups reduced RT after three years: PAL (-571.1 ms), PAB (-452.3 ms), and CTL (-456.8 ms), all $p<0.001$, with improvements in the intervention groups only in year one (PAL: -261.1 ms, $p<0.001$; PAB: -166.6 ms, $p=0.015$) and year two (PAL: -359.5 ms; PAB: -252.3 ms; both $p<0.001$). Difference-in-differences analyses showed greater reductions for PAB compared with CTL in year one ($p=0.011$) and for PAL compared with CTL in both year one and year two ($p<0.001$ and $p=0.005$, respectively).

Conclusion: PAL and PAB improve children's executive functions, with PAL producing greater effects on attentional orienting and spatial reasoning, whereas PAB promotes gradual and cumulative improvements in inhibitory control.

O.2.15-7

NNN-ECEC as an Intermediary for System Change: Community of Practice Collaboration Model for Early Childhood Food Environments

R. Sambell¹, L. Costello¹, R. Byrne², R. Wallace¹, A. Devine¹

¹Edith Cowan University, School of Medical and Health Science, Perth, Australia, ²Queensland University of Technology, School of Exercise and Nutrition Sciences, Brisbane, Australia

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Translation of ECEC nutrition research into practice in Australia has been slow and patchy, leaving jurisdictions working in silos. Communities of practice (CoP) have been identified as effective knowledge-brokering platforms because they sit at the centre of cross-sector networks, which positions them to facilitate system change. In 2018, the National Nutrition Network-ECEC formed as a virtual CoP acting as intermediary to connect research, practice and policy. This study describes the Network's operational model, demonstrates how it enables system change, and offers a blueprint for adoption.

Methods: Over eight years (2018–2025), the Network moved from organic clusters to a structured model. Members co-designed governance comprising a core group and three action streams, measurement, intervention, communication and engagement, with nominated co-leads. Membership was strategically mapped across jurisdictions and sector roles to identify gaps and strengthen system influence. The Network runs six-weekly virtual meetings and maintains a shared knowledge repository. An annual member survey and routine tracking of activities captures collaboration and evidence uptake.

Results: The stream model with strategic membership enabled important intermediary functions. Members undertook mapping of programs and resources across jurisdictions, which reduced duplication and identified gaps where support was most needed. Practitioners were connected with researchers, supporting use of validated measurement tools. Dialogues progressed around harmonising food provision recommendations where guidelines had been interpreted differently, and strategic relationships were built with peak bodies such as Dietitians Australia. Members reported that the Network strengthened cross-jurisdictional connectivity, provided easier access to research collaborators, and created clearer pathways from evidence to practice and policy uptake. Key enablers included fostering trust among members, role clarity through stream leads, predictable routines, and lightweight/informal governance enabled a willingness for member engagement.

Conclusion: A nationally coordinated CoP that operates as a system intermediary can convert fragmented efforts into coordinated system action. The NNN-ECEC demonstrates that when CoP have explicit roles in knowledge management, linkage and exchange, and capacity-building, they reduce siloed working, which, in turn, delivers measurable value to members and the sector. The NNN-ECEC provides a scalable template for replication to accelerate improvements to ECEC food environments across different country contexts.

O.2.15 Early care and education: Early Childhood Health Promotion: Interventions, Assessments, and Analytical Approaches

Room 3, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Early childhood educators (ECEs) are ideally positioned to support the development of children's fundamental movement skills (FMS), which are essential building blocks for physical activity and long-term health. However, most ECEs receive little specialized training in this domain. This study investigated the impact of a novel e-Learning course designed to enhance ECEs' knowledge and capacity to promote FMS within childcare settings. This was the first randomized controlled trial (RCT) to assess whether an e-Learning course for ECEs could improve children's objectively measured FMS, while also capturing parental perceptions of their child's FMS.

Methods: A cluster RCT was conducted across 12 childcare centres in London, Canada. A total of 42 ECEs and 145 preschool-aged children (2.5-5 years) participated. Centres were randomized into an intervention arm, in which ECEs completed the TEACH e-Learning course, or a control group continuing usual practice. A subsample of children (n = 48) was assessed at baseline and 3-month follow-up using the Test of Gross Motor Development-3 (TGMD-3), measuring locomotor and object-control skills. Parents of all participating children completed a questionnaire reporting their perceptions of their child's FMS at both timepoints. Data were analyzed with linear mixed-effects models, controlling for age and gender, with effect sizes expressed as Cohen's d.

Results: Children in the intervention group showed significant improvements in TGMD-3 locomotor skills ($p = .023$, $d = 0.67$) and total FMS ($p = .016$, $d = 0.71$) compared to controls. Object-control scores increased in the intervention group, but between-group effects were not significant ($p = .174$). Parent-reported locomotor, object-control, and total FMS also improved in the intervention group; however, intervention effects did not reach significance across these measures ($p > .05$).

Conclusion: This study provides promising evidence that an e-Learning course for ECEs can improve children's locomotor and overall FMS. While parent-reported outcomes trended positively, objective measures were more sensitive to change. Given its scalability and resource efficiency, e-Learning represents an innovative strategy to enhance ECEs' training and promote children's physical literacy. Integrating such programs with structured play and multicomponent interventions could strengthen their impact and better support children's movement development.

O.2.16-2

Effectiveness of a Machine Learning and App-based Digital Assistant to Increase Physical Activity in Adults: Outcomes of a Randomised Controlled Trial

C. Vandelanotte¹, S. Trost², D. Hodgetts¹, T. Imam³, M. Rashid³, Q. To¹, C. Maher⁴

O.2.16 E- & mHealth: Effectiveness and Implementation of Digital Lifestyle Interventions

Room 4, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: While technology-based physical interventions have shown their worth, outcomes are often modest and short lived. Interventions that integrate machine learning with real-time data to offer unprecedented levels of personalisation and customisation might offer solutions. The aim of this study was to conduct a randomised controlled trial to evaluate the effectiveness of a machine learning and app-based digital assistant to increase physical activity.

Methods: 204 office workers were recruited through Facebook advertisements and randomly allocated to an

ORAL ABSTRACT SESSIONS

intervention or control group. Intervention participants gained access to an app-based physical activity digital assistant that can learn and adapt in real-time to achieve high levels of personalisation and user engagement by virtue of applying a range of machine learning techniques (i.e. reinforcement learning, natural language processing and large language models). The digital assistant interacted with participants in 3 main ways: (1) educational conversations about physical activity; (2) just-in-time personalised in-app notifications ('nudges'), cues to action encouraging physical activity and (3) chat-based questions and answers about physical activity using Google's Gemini LLM. Outcomes were measured at baseline, 3 and 6 months. The primary outcome was change in moderate-to-vigorous physical activity (MVPA), assessed using the Axivity AX3 and the Active Australia Survey. Secondary outcomes include mental health (DASS21) and Wellbeing (Employee Wellbeing Scale). Linear Mixed Models were used to analyse outcomes.

Results: Over the 6-month period, daily minutes of MVPA decreased from 35.0 to 33.5 in the control group and from 39.7 to 35.0 in the intervention group (ns.) as measured by the Axivity monitor. Weekly minutes of MVPA decreased from 127.7 to 125.2 in the control group and increased from 143.6 to 213.1 in the intervention group ($P<0.01$) as measured by the Active Australia survey. Mental health and wellbeing outcomes slightly improved in the intervention group compared to the control group.

Conclusion: While self-reported physical activity significantly increased, similar to our pilot study, no improvement was observed using device-based measures. Process evaluation and mediation analyses will provide further insights. More research is needed to unlock the potential of machine learning applications to improve physical activity outcomes.

O.2.16-3

Outcomes of a Microrandomized Trial of Just-in-Time Adaptive Intervention Messages Nudging Weight-related Behaviors in Young Adults

C.G. Valle^{1,2}, B.T. Nezami¹, K.E. Hatley², M.A. Diamond², K. Polzien², H.M. Wasser¹, N. Gottfredson O'Shea³, D.F. Tate^{1,3,2}

¹University of North Carolina at Chapel Hill, Nutrition, Chapel Hill, United States, ²University of North Carolina at Chapel Hill, Lineberger Comprehensive Cancer Center, Chapel Hill, United States, ³University of North Carolina at Chapel Hill, Health Behavior, Chapel Hill, United States

O.2.16 E- & mHealth: Effectiveness and Implementation of Digital Lifestyle Interventions Room 4, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: While just-in-time adaptive intervention (JITAI) research continues to advance, evidence guiding the use of behavior change techniques (BCTs) in JITAI messages remains limited. This microrandomized trial tested effects of BCT message types on achievement of daily weight-related behavioral goals among young adults in a 6-month mobile intervention.

Methods: Participants in the Nudge study received a smart scale, activity tracker, food log app, videochat session, and access to an app with weekly lessons, tailored feedback, and up to 3 BCT messages daily. Participants had 3 daily goals: self-weigh, an activity goal, and a red food (high-calorie foods; RF) limit. At 3 daily decision points, participants were microrandomized to receive or not receive one of 7 BCT message types focused on promoting one of the 3 goals (i.e., 21 BCT-behavior message types). Using generalized estimating equations accounting for nesting of observations within individuals, we evaluated the unique effects of receiving, versus not receiving, each message type on daily proximal outcomes of weighing, meeting activity goals, and staying at/below RF limit.

Results: Over 168 days, 206 young adults ($M_{age}=32.8$ years; $M_{BMI}=32.7$ kg/m², 65% female, 38% racial/ethnic minority background) were randomized multiple times daily, resulting in 50,986 randomizations to receive BCT messages and 51,019 randomizations to not receive messages. Retention was 99.5% and 96.0% at 3 and 6 months, respectively. Being randomized to receive any BCT message, versus none, increased odds of weighing that day by 6% (OR=1.06, 95% CI: 1.01-1.12). Receiving any BCT message about RFs, versus none, increased odds of staying at/below one's RF limit that day by 5% (OR=1.05, 95% CI: 1.00-1.11). Receiving messages about discrepancy between current RF consumption and one's daily RF limit resulted in 19% higher odds of meeting one's RF limit that day (OR=1.19, 95% CI: 1.06-1.35). Social comparison messages that indicated other participants' recent weighing behavior increased odds of weighing that day by 26% (OR=1.26, 95% CI: 1.05-1.51).

Conclusion: Providing BCT-specific messages can prompt daily weighing and dietary goal achievement. Future studies should focus on promoting achievement of activity goals and examine whether message effects vary by program week, time of day, and individuals' contextual factors.

O.2.16 E- & mHealth: Effectiveness and Implementation of Digital Lifestyle Interventions
Room 4, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Behavioural weight management trials have struggled to engage women during the demanding postpartum period. Whilst digital tools to support weight management show promise, robust evidence on effectiveness of such interventions in this population remains limited. This randomised controlled trial (RCT) assessed the effectiveness of the theory-based *Supporting MumS* (SMS) intervention, an automated, bi-directional text message service, targeting diet and physical activity behaviour change, to support postpartum weight loss and weight loss maintenance for women with overweight or obesity.

Methods: Women, within 6 weeks to two years postpartum, with a BMI ≥ 25 kg/m², were recruited from five sites across the United Kingdom. The two-arm parallel group RCT compared the effectiveness of receiving 12 months of text messages about 1) weight management (intervention), versus 2) child health and development (active control), on weight change (kg) at 12-month follow-up. Weight was measured by researchers using standardised protocols and calibrated scales. An intention-to-treat analysis was conducted using ANCOVA, adjusting for baseline weight, site, ethnicity and recruitment pathway. Engagement with the intervention was assessed through participants' response rates to two-way text messages encouraging enactment of embedded behaviour change techniques across the 12 months. Hierarchical cluster analysis was applied to the bi-directional text message engagement data. Prespecified subgroup analysis assessed the relationship between engagement level and weight change at 12 months.

Results: Of the 892 women recruited (445 intervention; 447 active control), 674 (75.6%) participants were included in the primary analysis. There was no statistically significant difference in the adjusted mean weight change between groups (mean difference -0.1 kg [-1.0, 0.8], $p=0.84$). Cluster analysis produced two clusters, named 'high' and 'low' engagers. Subgroup analysis indicated significantly greater weight loss in high engagers at 12 months compared with the control group (mean difference -1.9 kg [-3.1, -0.6], $p=0.005$). No significant group difference was found for low engagers.

Conclusion: Findings show that a fully automated text message service did not support weight loss in a UK sample of postpartum women with overweight or obesity. However, pre-specified engagement analysis showed that women who engaged most with the intervention achieved significantly greater weight loss than the control group.

O.2.16 E- & mHealth: Effectiveness and Implementation of Digital Lifestyle Interventions Room 4, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Mobile health (mHealth) technologies offer new opportunities to extend behavioural counselling beyond clinic visits and provide personalised support at scale. Yet, evidence on their long-term effectiveness and implementation within primary care remains limited. The ENERGISED trial examined whether a general practitioner-initiated mHealth intervention, combining just-in-time adaptive text messaging with an initial phase of brief phone counselling, could sustainably increase physical activity in adults with prediabetes or type 2 diabetes.

Methods: This 12-month pragmatic, two-arm randomised controlled trial recruited adults with prediabetes or type 2 diabetes from 28 Czech general practices. All participants received brief advice from their general practitioner and a Fitbit activity tracker for self-monitoring for 12 months. The intervention group additionally received automated, context-sensitive text messages triggered by real-time Fitbit data via the HealthReact platform, supported by monthly counselling calls during the first six months. The primary outcome was change in daily step count from baseline to 12 months, assessed over seven consecutive days using a wrist-worn accelerometer. Secondary outcomes included physical activity volume (average acceleration) and intensity (intensity gradient), self-reported anxiety and depression (HADS), quality of life (SF-12), lower-body strength (30-s chair-stand test), and clinical indicators including HbA1c, fasting glucose, blood pressure, and lipid profile.

Results: A total of 343 participants (mean age 62 ± 12 years; 55% women; 33% prediabetes) were randomised, and 308 (90%) completed 12-month follow-up. There was no significant between-group difference in the 12-month change in daily step count (mean difference 309 steps/day; $p = 0.32$). At six months, the intervention group showed higher physical activity intensity (intensity gradient difference 0.038; $p = 0.03$) and better mental health outcomes, with lower anxiety and depression and higher SF-12 mental scores (all $p < 0.05$). These effects were not maintained at 12 months. No other significant differences were observed for secondary outcomes.

Conclusion: This general practitioner-initiated mHealth intervention produced short-term improvements in physical activity intensity and mental well-being but did not increase overall activity volume at 12 months. The results highlight the potential of integrating wearable-based just-in-time messaging into routine care and the continued importance of human support for sustaining engagement and long-term behavioural change.

O.2.16 E- & mHealth: Effectiveness and Implementation of Digital Lifestyle Interventions Room 4, May 29, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: LvL UP is a holistic blended mHealth intervention promoting physical activity, healthy eating, and emotion regulation among adults in Singapore at risk of non-communicable diseases (NCDs) or common mental disorders (CMDs). Such interventions can support scalable prevention efforts, but their value depends on both effectiveness and cost-effectiveness. LvL UP's effectiveness and cost-effectiveness were evaluated in a sequential, multiple assignment, randomised trial, with the present abstract focusing on findings from the cost-effectiveness analyses.

Methods: Adults aged 21–59 years were recruited and randomised (2:1) to receive either the LvL UP intervention or a usual-care condition (a mock app providing generic, publicly available health resources) for 6 months. Within the intervention arm, participants identified to be 'non-responders' at 1-month were re-randomised to either continue receiving LvL UP or receive additional motivational interviewing (MI)-inspired coaching delivered by MI-trained coaches via an instant messaging platform (LvL UP + MI). Cost-effectiveness was assessed using EQ-5D-5L utility scores to estimate Quality-Adjusted Life Years (QALYs) and self-reported measures of healthcare utilisation, work productivity, and broader resource use collected at baseline and 6-month. The analysis is conducted from societal and healthcare system perspectives. We will estimate Incremental Cost-Effectiveness Ratios (ICERs), and incremental net monetary benefit and generate Cost-Effectiveness Acceptability Curves (CEACs) across a range of willingness-to-pay thresholds.

Results: Our participants (n=678, 31.6±9.6 years, were mostly females (57.5%), of Chinese ethnicity (82.7%), and had obtained at least a Bachelor's degree (64.5%). At baseline, n=452 were randomised into the intervention group (66.7%), and n=226 were randomised into the control group (33.3%). Intervention-group non-responders identified at 1-month (n=238, 52.7%) were re-randomised 1:1 to either continue receiving LvL UP, or receive LvL UP + MI. At 6 months, n=13 had withdrawn from the trial (1.9%). LvL UP cost-estimations and cost-effectiveness are ongoing, and will be reported at the conference, with reporting in line with the Consolidated Health Economic Evaluation Reporting Standards (CHEERS) statement.

Conclusion: The cost-effectiveness results will determine whether LvL UP provides sufficient health gains relative to implementation costs to support scale-up in real-world settings.

O.2.16-7

Step Behaviour Profiles Derived from 24-hour Accelerometry Data and their Associations with Cardiometabolic Health

A. Backes¹, L. Malisoux¹

¹Luxembourg Institute of Health, Department of Precision Health, Strassen, Luxembourg

O.2.16 E- & mHealth: Effectiveness and Implementation of Digital Lifestyle Interventions

Room 4, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Daily step counts are a key component of physical activity (PA) and are increasingly emphasised in public health recommendations. Recent advances in open-source algorithms now allow detailed step-related metrics to be derived from 24-hour raw accelerometer data. This study aimed to identify distinct step behaviour profiles and examine their associations with cardiometabolic health biomarkers.

Methods: This cross-sectional study included 1072 Luxembourg residents aged 25–79 years with ≥4 valid accelerometry days. Functional data analysis modelled daily step trajectories, which were classified into distinct daily step clusters using k-means clustering. Participants' series of daily clusters were subsequently analysed using sequence analysis to identify broader sequence clusters, representing habitual multi-day step behaviour profiles. Adjusted linear regression models examined associations between these profiles and cardiometabolic biomarkers, including systolic and diastolic blood pressure, fasting plasma glucose (FPG), triglycerides, high-density lipoprotein cholesterol (HDL-c), apolipoprotein B/A1 ratio, fasting insulin, and a clustered metabolic risk score (CMRS).

Results: Four distinct step profiles were identified: consistently inactive (4824 steps/day), consistently active (10915 steps/day), weekday active (7377 steps/day), and weekend warriors (7157 steps/day). Compared to the consistently inactive reference group, the consistently active group showed significantly lower levels of FPG, triglycerides, apolipoprotein B/A1 ratio, fasting insulin and CMRS, and higher HDL-c levels. The weekday active pattern showed significantly lower levels of triglycerides, apolipoprotein B/A1 ratio, fasting insulin and CMRS, and higher HDL-c levels, while the weekend warrior cluster showed significantly lower fasting insulin levels and CMRS. However, after further adjustment for total step counts, none of these associations remained statistically significant, indicating that total step volume, rather than temporal distribution, primarily explained the observed cardiometabolic benefits.

Conclusion: Although active step profiles were initially linked to more favourable cardiometabolic markers, these associations were fully explained by total step volume. The findings suggest that achieving sufficient overall step

ORAL ABSTRACT SESSIONS

counts may be more important for cardiometabolic health than the timing or distribution of steps across the week. Nonetheless, the data reduction inherent to sequential clustering may limit pattern detection, and future work using alternative methods (e.g. reversed graph embedding methods) may help uncover more nuanced step behaviour patterns related to health outcomes.

O.2.16-8

Temporal Association between Objectively Measured Smartphone Usage Patterns with Cognitive Function among University Students

M. Chen¹, X.H. Chua¹, S.Y.X. Tan¹, N. Padmapriya¹, F. Müller-Riemenschneider^{1,2}

¹National University of Singapore and National University Health System, Saw Swee Hock School of Public Health, Singapore, Singapore, ²Berlin Institute of Health, Charité, Digital Health Centre, Berlin, Germany

O.2.16 E- & mHealth: Effectiveness and Implementation of Digital Lifestyle Interventions

Room 4, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Excessive smartphone use may impair cognitive functioning through constant attentional switching. However, most existing studies rely on self-reports and one-time cognitive assessments. This study examines the temporal associations between objectively measured smartphone use patterns and cognitive function using repeated, real-time assessments among university students.

Methods: The BALANCE (Behavioural Assessment of Learning and Navigation of Smartphone Engagement for Healthier Living) study recruits up to 750 full-time undergraduate students (aged ≥ 18 years) at the National University of Singapore. Recruitment is conducted entirely online without face-to-face contact. Participants install the 360INSIGHTS app, which passively tracks smartphone screen time, unlock frequency, and type of app usage across Android and iOS platforms. The app concurrently administers four ecological momentary assessments (EMAs) daily for 10 days. Each EMA captures: (1) digital media use context (screen type, duration, motivation, multiscreening); (2) mental and physical states; and (3) cognitive performance. Two validated cognition assessments: (1) Matrix Reasoning (MR): measures fluid intelligence and nonverbal reasoning; (2) Stroop Colour-Word Test (SCWT): a gold-standard measure of attentional control and cognitive interference. Repeated-measures linear mixed models assess associations between smartphone use and cognitive performance, adjusting for demographic and contextual factors.

Results: Data collection is ongoing and expected to be completed by December 2025. Pilot data (N = 100) demonstrated high adherence, with 90% providing ≥ 7 valid days. Mean daily smartphone use was 6.1 ± 2.8 hours, peaking in the evening. Males showed higher use than females (6.2 ± 2.9 vs. 6.0 ± 2.8 hours/day). The average daily screen use frequency was 118.2 ± 79.0 times/day, higher on weekdays (124.7 ± 80.7) than weekends (102.7 ± 72.5). Longer daily smartphone screen time was associated with higher interference scores at both early afternoon ($\beta=0.32$, $p=0.044$) and late afternoon ($\beta=0.41$, $p=0.024$), indicating poorer inhibitory control with greater smartphone exposure.

Conclusion: This ongoing digital cohort integrates passive smartphone tracking with real-time cognitive testing to dynamically capture cognitive responses to digital media use. Pilot results suggest that heavier smartphone use may be linked to reduced attentional control. Findings from the full cohort will clarify temporal associations and guide evidence-based strategies for healthier digital engagement.

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: The aim of the IMPROVE study, a parallel cluster-randomized hybrid type 3 effectiveness-implementation study was to compare the effect of two tailored implementation strategy bundles (Basic with six strategies vs. Enhanced with four additional strategies providing external support) on fidelity to the universal and evidence-based Healthy School Start family support program.

Methods: The study was conducted in 45 primary schools in three municipalities in the Stockholm region with a high prevalence of child obesity and a high proportion of foreign-born parents with two consecutive cohorts over two academic school years. The strategy bundles from the SISTER taxonomy were based on pre-identified determinants together with stakeholders. Fidelity was measured with an adherence score (0-4) and parents' responsiveness score (1-5) to the four intervention components (health brochure for parents, motivational interviewing by school nurse with parents, classroom module with nine sessions for children, diabetes risk test for parents). Data was analyzed using mixed-effects linear and logistic regression models.

Results: A total of 946 parents and 655 children participated in the study. Fidelity to the intervention components was around 75%. After the first year, schools in the Enhanced bundle showed a higher adherence score (non-significant), but after two years this difference was no longer visible ($\beta = 0.01$, $p = 0.95$, 95% CI: -0.24, 0.25). However, parents born in the Nordic countries had twice the odds ($p < 0.001$, 95% CI: 1.14-3.43) of completing the motivational interviewing compared to non-Nordic born. When adjusting for school, cohort and parents' region of birth, responsiveness of parents to each of the four components (3.4 – 3.7) was not statistically different between the Basic and Enhanced bundle.

Conclusion: Adding external support strategies did not improve adherence or responsiveness to the Healthy School Start program showing that schools were well equipped to implement the manual-based program after an initial introduction. However, additional support might be needed in schools with a high proportion of foreign-born parents. Therefore, we conclude that external coaching during the first year could have an additional value in this context. These findings could be relevant for other countries wanting to scale-up school-based health promotion programs.

O.2.17-2

Co-designing Steps and Processes with Small-and-Medium-Sized Enterprises for Scaling-up the Implementation of Physical Activity across Europe: The Active4SME Project

A. Puig-Ribera¹, C. Gelong², A. Codina-Nadal¹, I. Taberner¹, I.V. Vannkanen³

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Tackling physically inactive lifestyles is a universal challenge to promote health. Workplaces have an essential role in promoting PA to the adult population. However, low scalability of effective, feasible and sustainable PA programs in small-and-medium-sized enterprises (SMEs) is a challenge. SMEs represent 99% of European businesses. Scalability means embedding PA programs into SMEs specific context. Given the limited evidence-to-practice, Active4SME codesigns and seeks feasible solutions on steps and processes to improve dissemination and PA implementation in SMEs. Results of a specific geographical European context, Active4SME-Catalonia, are presented.

Methods: Using the RE-AIM framework and Citizen's Science, twenty SMEs from two Catalan counties (Osona, n=7; Garrigues, n=13) were reached out for participating in two co-design sessions (presential, 2 hours, April 2025). Sessions were conducted by two experts in co-design and, the protocol included several categories: (1) status for implementing PA, (2) motivations and barriers, (3) solutions to tackle barriers, (5) identification of stakeholders for overcoming barriers, (6) impact expectations from implementing PA. SMEs expressed their opinions writing on hexagons of different colours. Each colour corresponded to a specific category, facilitating interrelationships between data categories. Data analysis systematized the collaboratively expressed information and, photographs of the hexagons were taken for visual documentation. A summary report was sent back to SMEs and external observers for verification.

Results: SMEs' motivations (micro, n=4; small n=8; medium, n=8; agriculture, n=4; industry, n=3; construction, n=2; commerce, n=5; educational, n=2; health, n=2; sports, n=2) for implementing PA included improving the work environment, team cohesion and workers' well-being and productivity. However, SMEs faced specific challenges: (1)

ORAL ABSTRACT SESSIONS

overcoming lack of knowledge for implementing PA, (2) improving internal communication to prevent perceiving PA as an additional burden, (3) having no certainty about the tailored impact of implementing PA, requiring evaluation studies, (4) adapting PA to workers' diversity, (5) improving infrastructure, (6) PA professionals supporting PA personalization, (6) improving motivation through training and communication strategies.

Conclusion: Co-designing solutions to support local SMEs for implementing PA could serve as a Prove-of-Concept to improve PA scalability across Europe.

O.2.17-3

Economic Evaluation of OncoActive: A Computer-tailored Physical Activity Intervention for Cancer Survivors

R. Golsteijn¹, C. Bolman¹, M. Hoogland², E. Volders², L. Lechner¹

¹Open University of the Netherlands, Health Psychology, Heerlen, Netherlands, ²Open University of the Netherlands, Heerlen, Netherlands

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Although physical activity (PA) can reduce long-term symptoms and improve quality of life in (former) cancer patients—thereby potentially mitigating rising healthcare cost—only a minority meets PA guidelines. OncoActive, a computer-tailored eHealth intervention has previously proven effective in increasing PA in daily life and may offer a scalable, cost-effective solution. This study therefore examines the cost-effectiveness and cost-utility of OncoActive compared to usual care.

Methods: A cost-effectiveness analysis and cost-utility analysis were conducted alongside a randomized controlled trial among 478 (former) prostate and colorectal cancer patients, who were allocated to OncoActive or a waiting-list usual care group. Moderate-to-vigorous PA (MVPA) was assessed with an accelerometer (ActiGraph); Quality-adjusted life years (QALYs) were derived from the EORTC QLU-C10D. Fatigue, physical functioning and depression were assessed as secondary outcomes. Societal costs—including healthcare costs, patient and family costs, productivity losses, and intervention costs—were assessed with a modified version a self-report medical consumption questionnaire (IMTA-MCQ). Incremental cost-effectiveness (ICER) and cost-utility ratios (ICUR) were calculated over 12 months. Uncertainty was addressed through non-parametric bootstrapping and sensitivity analyses.

Results: Societal costs were higher in the OncoActive group than in usual care, although not significantly. OncoActive increased MVPA, yielding an ICER of €42 per additional MVPA minute. The probability of cost-effectiveness for MVPA was low at a willingness-to-pay (WTP) of €0 but increased to 80% at €175/min MVPA. OncoActive did not increase QALYs, resulting in an inferior ICUR (-€383,646/QALY) and thus in a consistently low probability of cost-effectiveness across WTP thresholds. The cost-effectiveness for fatigue (ICER: €271 / 1-point decrease) and physical functioning (ICER: €1.236 / 1-point increase) depended on the WTP. Sensitivity analyses produced similar findings.

Conclusion: Depending on the WTP, OncoActive may be considered cost-effective for improving MVPA, fatigue, and physical functioning among (former) cancer patients, but it was not cost-effective in terms of QALYs due to the absence of measurable quality-of-life gains. High baseline quality-of-life scores may have limited the ability to detect QALY improvements. Nonetheless, its focus on behavior change, scalability, and ability to increase PA without supervision suggest potential value for cancer survivorship care.

O.2.17-4

Building Capacity for Nature Prescribing in Clinical Practice: A Co-designed Sustainability-focused Approach

V. Sullivan¹

¹University of Queensland, School of Public Health, Brisbane, Australia

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Healthcare systems contribute to climate change through carbon-intensive practices. Preventive healthcare initiatives such as Nature Prescribing offer a way for health professionals to connect people at risk of chronic diseases to lower carbon, locally delivered nature-based physical activities, supporting both human and planetary health. Despite this potential, Nature Prescribing remains under-utilised globally and implementation barriers limit routine practice. The Springfield Green Hearts Initiative (Australia) aimed to identify these barriers and enablers and then co-design resources that support Nature Prescribing, thereby encouraging more sustainable healthcare practice.

Methods: This is a two-phase study. Phase 1: a Behavioural Design Thinking approach was used with local health professionals from diverse disciplines, at-risk citizens, nature-based physical activity providers, and community hub managers (interviews n=45; workshops). Qualitative framework analysis was used deductively and inductively through a Socio-Ecological-Model lens to understand multi-level implementation barriers and enablers. Phase 2: co-designed clinical resources and organisational tools are currently being tested in a mixed-methods acceptability study. Pre-and-post-questionnaires assess changes in health professionals' knowledge, confidence and consultation practices. Acceptability is examined using the Theoretical Framework of Acceptability, exploring affective attitude, ethical alignment, perceived burden, and self-efficacy towards nature prescribing.

Results: Phase 1 identified that health professionals (n=12) were enabled by *aligned personal and professional values*, *community knowledge*, *access to risk-assessed activities*, and *professional development opportunities*. Patient (n=18) enablers included *nature literacy*, *community connectedness*, *high-quality conversations with clinicians*, *accessible green spaces*, and *welcoming activity providers*. These insights directly informed the development of clinical resources and organisational tools focused on *community knowledge*, *nature-oriented person-centred conversations*, *climate literacy*, and *organisational capacity building*. Phase 2 data collection and analysis are underway. Full acceptability findings, including changes in knowledge, confidence and reported practice, will be presented at the conference alongside the Nature Prescribing resources.

Conclusion: Springfield Green Hearts demonstrates how preventive healthcare can be incorporated into clinical practice to support human health and environmental sustainability. By addressing implementation barriers and building capacity among health professionals and organisations, Nature Prescribing offers a practical pathway to reduce the health sector's carbon footprint while enhancing patient engagement in nature-based activities that promote physical, mental and social health.

O.2.17-5

Barriers and Facilitators to Weight Management Behaviours among Underserved Women Living with and beyond Cancer: Findings from a Scoping Review and Qualitative Study

A. Creaser¹, F. Kennedy¹, S. Wellington¹, N. King¹, B. Temple¹, A. Saeed¹, B. Apel², L. Lawal², T. Shah³, J. Walabyeki², J. Saxton², R. Beeken¹

¹University of Leeds, Leeds, United Kingdom, ²University of Hull, Hull, United Kingdom, ³South Asian Supernovas, London, United Kingdom

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Excess weight can increase the risk of poor health outcomes for women living with and beyond cancer (LWBC). Behavioural weight management interventions often fail to engage those from underserved communities, including women from minoritised ethnic backgrounds and/or low-income households who may face structural, cultural, and economic barriers. These women experience cancer-related health disparities, low access to support services, and are underrepresented in intervention research. We aimed to identify barriers and facilitators to weight management among underserved women LWBC to inform development of equitable, effective behavioural interventions.

Methods: *Scoping review:* Six databases (Embase, Medline, Web of Science, PsycINFO, CINAHL, Scopus) were searched in December 2024. Eligible sources reported barriers and facilitators to behavioural weight management interventions among underserved women (≥18 years) LWBC. Data were narratively synthesised.

Qualitative interviews: Semi-structured interviews were conducted with 25 UK women who self-identified as South Asian (n=12), Black African (n=6), Black Caribbean (n=4), and/or as living on a low income (n=7), diagnosed with breast cancer. The interview guide was informed by the Theoretical Domains Framework, and data were analysed, with a peer researcher, using reflexive thematic analysis.

Results: *Scoping review:* Thirty studies were included (73% peer-reviewed; 90% conducted in the United States). Most

ORAL ABSTRACT SESSIONS

focused on African American or Black women (37%) and those diagnosed with breast cancer (57%). Social support, cultural adaptation, and intervention tailoring facilitated intervention engagement, whereas barriers included cancer stage, treatment side effects, safety concerns, financial constraints, transport difficulties, and English-only delivery.

Qualitative interviews: Participants (mean age 50.3 years, SD=9.6; range 32–70) were diagnosed between March 2020 and March 2025. Treatments included surgery (n=20), hormone therapy (n=15), radiotherapy (n=14), chemotherapy (n=12), and/or biological therapy (n=7). Developed themes reinforced the importance of social support, cultural sensitivity, and financial accessibility, as found in the scoping review. Additional insights included tensions between cancer survival and weight management, identity changes post-diagnosis, and self-advocacy for support. Participants emphasised the need for holistic, culturally responsive, and socially supported approaches to weight management.

Conclusion: Underserved women LWBC experience multifaceted challenges to weight management. Addressing structural and cultural barriers through co-designed, contextually tailored interventions could reduce inequities and improve long-term health outcomes.

O.2.17-6

Scale up the SuperFIT Approach in ECEC in the Netherlands; Using the PRACTIS Guide to Identify Factors and Strategies

S. Gerards¹, K. Beckers¹, L. Harms¹, N. Bartelink¹, F. Van Nassau², J. Gubbels¹

¹Maastricht University, Health Promotion, Maastricht, Netherlands, ²Amsterdam UMC, Amsterdam, Netherlands

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: SuperFIT is an integrated approach to promote healthy habits in preschool children, via the early childhood education and care (ECEC) setting. Scaling up of evidence-based effective interventions is essential to improve health-promoting practices in ECEC settings. In this study we applied the PRACTIS guide to investigate the upscaling of SuperFIT. We had two research questions: 1) What are facilitators and barriers identified by stakeholders in the process of scaling up SuperFIT? 2) Which strategies can tackle these barriers to optimize scalability of SuperFIT?

Methods: Multiple stakeholders (N=14) working on strategic or operational levels and involved in the scale-up of SuperFIT participated in semi-structured individual and group interviews. The aim was to get an understanding of the scale-up process, to identify barriers and facilitators and to cocreate strategies to tackle barriers.

Results: Barriers and facilitators existed at four levels (adapted from Koorts 2018): intervention, provider, organisational, and community. Adaptability emerged as a key factor across levels, facilitating contextual fit but challenging fidelity and clarity on how to implement. At intervention level, adaptability supported credibility and flexibility for scaling up, yet raised concerns about core components. At provider level, basic knowledge of the core themes, as well as existing coaching skills, facilitated future implementation and scale-up. However, lack of experience working with adaptable intervention posed a challenge. At organisational level, commitment of the intervention owner and future provider in new regions as well as a positive climate facilitated scale-up, although uncertainties remained regarding structures and responsibilities. At community level, adaptability supported contextual fit, but early and active involvement of ECEC teachers proved essential, as ECEC organisations often face multiple challenges, such as staff turnover. Identified strategies included development of visual support materials, guidance for prospective providers, organizational support for ECEC teachers and clear agreements about ownership and structure.

Conclusion: The PRACTIS guide proved to be a very useful tool in identifying barriers, facilitators and strategies for scaling up SuperFIT. While several barriers remain, the identified strategies offer a path forward, enabling steps towards further scaling up SuperFIT. Future evaluation will help to refine strategies.

ORAL ABSTRACT SESSIONS

O.2.17-7

Evaluating the Implementation of Harmonised Multi-site Data Collection on Youth Physical Activity Behaviours: The INDEEP Process Evaluation Protocol

A. D'Sa¹, F. van Nassau², B. Victor³, Y. Oldert², A. Lane¹, K. Dowd¹

¹SHE Research Centre, The Technological University of the Shannon, Department of Sport and Health Sciences, Athlone, Ireland, ²Amsterdam Public Health Research Institute, Amsterdam UMC, Department of Public and Occupational Health, Amsterdam, Netherlands, ³Ghent University, Department of Movement and Sport Sciences, Ghent, Belgium

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: High-quality harmonised data are essential to understand physical activity behaviours (PABs) across contexts and populations. However, multi-site data collection (MSDC) often poses challenges related to ethics, logistics, training, and fidelity, which can affect data quality and comparability. The INtervention on the DEterminants of, and Expertise in, Physical activity behaviours (INDEEP) project aims to develop a feasible, acceptable, and scalable strategy for harmonised European data collection on youth PABs and their determinants. This study presents the process evaluation protocol designed to evaluate the implementation of INDEEP's MSDC strategy across five European countries.

Methods: A mixed-methods design will be employed, integrating multiple qualitative and quantitative data sources. Data will be collected from various stakeholders, including implementers (research staff) and end-users (adolescents and caregivers) between January and June 2026. Implementer data sources will include logbooks, end of measurement day reports, and post-data collection de-brief interviews, with surveys and semi-structured interviews capturing end-user feedback. Data will be triangulated to explore contextual influences, implementation mechanisms, and outcomes across settings, in accordance with the UK Medical Research Council framework for process evaluations.

Results: The INDEEP process evaluation will generate insights into practical facilitators and barriers influencing harmonised MSDC across diverse European contexts. Analysis will explore, from the perspective of multiple stakeholders, whether contextual factors (i.e., ethics procedures, cultural norms, resource availability) influence the feasibility, acceptability, and scalability of the adopted strategies. This study will also investigate key implementation mechanisms that may support successful cross-site coordination. With an overall aim to collect high-quality data on PABs and their determinants in adolescents, their siblings and caregivers.

Conclusion: The INDEEP process evaluation will advance our understanding of how to implement harmonised, MSDC strategies for youth physical activity research. Findings will guide future large-scale surveillance studies towards feasible and acceptable data collection strategies for high-quality harmonised data sets on PABs in youth across Europe.

O.2.17-8

A Scalable Approach to Live Observations: Validity of Swivl™ Robotic Video for Feeding Practice Assessment

J. Rutledge¹, D. Zhang², K. Spring³, T. Massey-Swindle⁴

¹Louisiana Tech University, Ruston, United States, ²University of Arkansas for Medical Sciences, Little Rock, United States, ³Louisiana State University Pennington Biomedical Research Center, Baton Rouge, United States, ⁴Arkansas Children's Research Institute and University of Arkansas for Medical Sciences, Little Rock, United States

O.2.17 Implementation and scalability: Optimizing Interventions: Scaling Up and Assessing Health Behaviors in Complex Settings

Room 5, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Direct observation is considered the gold standard for assessing teacher mealtime practices, but it is resource-intensive, disruptive, and limits scalability. Swivl™ robotic video technology offers a lower-cost alternative that allows classrooms to be recorded without additional personnel. The purpose of this study was to assess the validity of Swivl-based video coding compared to live observation of teacher feeding practices during WISE nutrition lessons in early childhood classrooms.

Methods: Seventy-two classroom sessions were observed, of which 52 contained complete paired live and Swivl-based

ORAL ABSTRACT SESSIONS

coding. Trained coders rated each session in real time and later using Swivl recordings in a single-pass viewing. Two constructs were evaluated. *Table Talk* captured teacher feeding communications and included counts of supportive and unsupportive feeding comments. *Fidelity* assessed adherence to the four WISE evidence-based practices during nutrition lessons (appropriate feeding practices, use of the program mascot owl puppet [Windy], hands-on exposure to foods, and teacher role modeling of tasting). Agreement between live- and video-coded data was assessed using two-way mixed-effects intraclass correlation coefficients (ICC; absolute agreement, single measures) and Cronbach's α . Items with 0 standard deviation at either time point were excluded, because they provide no discriminatory information and may distort the validity estimate.

Results: For Table Talk, agreement was excellent for Positive Comments (ICC = .94, 95% CI = .90–.97, $p < .001$; $\alpha = .98$) and good for Negative Comments (ICC = .82, 95% CI = .71–.89, $p < .001$; $\alpha = .90$). For Fidelity, all four subscales demonstrated excellent agreement: Feeding Practice (ICC = .86, 95% CI = .77–.92; $\alpha = .92$), Windy (ICC = .97, 95% CI = .94–.98; $\alpha = .98$), Hands-On (ICC = .97, 95% CI = .94–.98; $\alpha = .98$), and Role Modeling (ICC = .98, 95% CI = .97–.99; $\alpha = .99$), all $p < .001$.

Conclusion: Swivl-based video coding shows good to excellent agreement with live observation for both feeding communications and fidelity to nutrition curriculum practices. Results of the current study indicate Swivl provides a valid and scalable alternative for collecting high-quality feeding behavior data in early childhood and community-based research.

O.2.18-1

Operationalising and Evaluating Place-based Whole Systems Approaches: Development of a Conceptual Framework and Maturity Matrix

H. Wingfield¹, K. Shearn¹, R. Vincent², K. Harris³, S. Armour¹, J. Woodward⁴

¹Sheffield Hallam University, Sheffield, United Kingdom, ²Independent Learning and Evaluation Consultant, Sheffield, United Kingdom, ³Hartpury University, Gloucester, United Kingdom, ⁴Sport England

O.2.18 Systems Science: From Environment to Action: Systems Science for Health Behavior Change
Room 6, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: This paper presents the development of a Conceptual Framework and Maturity Matrix designed to support the operationalisation and evaluation of Place-Based Systemic Working (PBSW) in England to address physical activity inequalities. The framework responds to the complexity and uncertainty inherent in systems change, making explicit the dynamic processes that influence outcomes and the relational conditions underpinning local change.

Methods: Drawing on evidence synthesis, stakeholder co-production across multiple Place Partnerships, and realist principles of mechanisms of change, we developed a Conceptual Model articulating foundational relational dynamics, cultures, and structures shaping inequalities. The model identifies three key areas for action and nine cross-cutting conditions for change. A complementary Maturity Matrix was constructed to describe evidence-based and inferred stages of progression, enabling systematic data capture and reflective learning at local and national levels.

Results: The Conceptual Framework provides a scaffold for evaluation and learning, advancing beyond existing principles-based guidance by recognising variations in ideologies and contextual manifestations of conditions for change. The Maturity Matrix supports both quantitative and qualitative assessments of progress, enabling systematic case comparison and facilitating iterative synthesis of place-based findings. Early application demonstrates its utility in framing local evaluation designs and guiding collaborative decision-making, while highlighting challenges such as limited representation of inactive populations and risks of misinterpreting the framework as a prescriptive model.

Conclusion: Despite inherent limitations and measurement challenges, the framework offers a pragmatic tool for evaluators and practitioners seeking to understand and influence complex systems. It enables structured assessment of enabling conditions and fosters shared learning across diverse contexts. Future work will refine the model through ongoing testing in England and explore its relevance internationally. By making “fuzzy” concepts explicit, this approach contributes to building cumulative knowledge on systems change and offers potential applicability beyond physical activity.

ORAL ABSTRACT SESSIONS

O.2.18-2

Leveraging Blue Spaces for Public Health: Co-creating a Whole-system Action Plan

N. Smith¹, M. Georgiou², D. Irving³, S. Chastin¹

¹Glasgow Caledonian University, School of Health and Life Sciences, Glasgow, United Kingdom, ²University of Glasgow, School of Social & Political Sciences, Glasgow, United Kingdom, ³University of Stirling, Hydro Nation Chair, Stirling, United Kingdom

O.2.18 Systems Science: From Environment to Action: Systems Science for Health Behavior Change
Room 6, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Non-communicable diseases (NCDs), obesity, physical inactivity, and poor mental health are rising globally, a trend intensified by COVID-19 and climate change. Urban blue spaces, including rivers, canals and coasts, have emerged as a promising asset to counter these challenges, offering opportunities to improve health and wellbeing. However their management often lacks coordination for achieving health benefits. A systems approach, integrating diverse stakeholders through co-creation, is essential. We present evidence-based co-created whole-system recommendations for leveraging blue spaces to enhance public health. The recommendations can guide decision-makers and practitioners in preserving, revitalising and using urban blue spaces for synergistic benefits to people and the planet. We showcase implementation in Scotland, a nation particularly vulnerable to non-communicable diseases and poor mental health, yet uniquely positioned as a “Hydro Nation.” This status highlights Scotland’s potential to leverage its blue spaces as vital public health assets.

Methods: We followed a three-step process to develop the recommendations. First, we established a robust evidence base through six years of extensive mixed-methods academic research on the health benefits of urban blue spaces. Second, we partnered with a national water-focused research and innovation programme to integrate policy expertise and reduce siloed working. Third, we co-created an action plan with diverse stakeholders using systems-based co-creation, guided by the DISCOVER framework, to ensure inclusive, coordinated, and context-sensitive solutions.

Results: The system map includes 137 variables and 220 causal linkages, organised around four mechanisms: promoting physical activity, fostering social interaction, supporting a healthy environment, and reducing stress. Developed from stakeholder interviews and co-creation sessions in Scotland, the map highlights interconnected factors influencing how blue spaces affect public health. Each mechanism contains key relationships and feedback loops. An interactive map available online: <https://nsmith222.kumu.io/recommendations-for-leveraging-blue-space-for-health>.

Conclusion: The resulting 12 recommendations are the first actionable recommendations for leveraging blue space for public health, including the experiences and expertise of around 300 people and longitudinal evidence covering 19 years of data. The co-created recommendations provide a practical guide for decision-makers, enabling synergistic improvements for both human wellbeing and environmental sustainability.

O.2.18-3

Discovery of Universal Behavioral Laws Underlying Human Activity Patterns across Global Populations

O.2.18 Systems Science: From Environment to Action: Systems Science for Health Behavior Change
Room 6, May 29, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Daily activity patterns fundamentally shape human health, economic productivity, and environmental sustainability. Yet, we lack understanding and mechanistic models of how humans organize their active time—knowledge that is critical to informing policy and practice.

Methods: We analyzed over 600,000 daily activity patterns from eight cohorts spanning four continents—from hunter-gatherers to industrialized populations—using continuous accelerometer monitoring (NHANES in the USA; and the UK Biobank and Whitehall II, ENRICA 2 in Spain, MASKin South Africa, TrUST Colombia, and Tanzania (The Hadza people). Raw accelerometer signals were converted into minute epoch of activity intensity. Each minute epoch was classified, as either active or inactive based on intensity thresholds corresponding approximately to ≥ 3 metabolic equivalent (MET) or < 3 MET, respectively, device-specific cut points were taken from manufacturer specifications or the latest calibration studies for the target population. The 3 MET threshold was selected because it marks the level of physical activity that is typically *perceived consciously as requiring an effort*. Activity below this level (< 3 METs) encompasses light-intensity behaviors and sedentary behaviors. This threshold therefore provides both a physiological and phenomenological basis for distinguishing effortful from effortless activity.

Results: Despite vast differences in geography, culture, context and measurement methodology, all populations exhibited a similar pattern of daily activity: periods of inactivity, corresponding to low intensity behaviors typically experienced as effortless (< 3 MET) follow a $1/t$ power-law distribution, while active periods (typically effortful, ≥ 3 MET) decay more rapidly as $1/t^{2.5}$. This universal pattern shows that humans have an intrinsic tendency to engage in short bouts of effortful activity interspersed with long periods of inactivity. This can be understood as a time- and energy-management optimization strategy balancing limited daily time and finite energy reserves. This is supported by the fact that a simple dynamical law can be derived that quantitatively reproduces and explains activity patterns across all populations using simple and measurable parameters representing fundamental time and energy constraints.

Conclusion: Recognizing these intrinsic dynamics opens new avenues for designing interventions and policies that align with natural human behavior, potentially enhancing impact, adherence, and long-term sustainability in public health, climate policy, and urban planning.

O.2.18-4

The River of Utilisation: From Insight to Action, Who Cares and Who Acts on Findings

E. Brady-Young¹

¹Sport England & Hartpury University, Together an Active Future, Burnley/Gloucester, United Kingdom

O.2.18 Systems Science: From Environment to Action: Systems Science for Health Behavior Change
Room 6, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: This work explores how embedded evaluation balances expert and participatory traditions of care within complex, place-based systems. It examines tensions between independence and involvement, rigour and relevance, proposing that building evaluative capacity requires reflexive balance, strengthening systems' ability to generate trustworthy insight while empowering people to act. It is situated within Sport England's systematic place-based approaches, now successfully scaling across England, where evaluation of complex systems approaches remains one of the most significant gaps and challenges for academics and practitioners.

Methods: The research applies a realist-informed developmental evaluation to study evaluation "in motion." Data sources include over 250 reflexive journals, evaluative artefacts (Stories of Change, Ripple Effect Maps, Conditions Tracker), interviews, and partner reflections. Analysis proceeds through four linked papers:

- Paper 1: Analytic autoethnography of embedded evaluation practice (2025)
- Paper 2: Realist synthesis of utilisation patterns across place-based systems (2026)
- Paper 3: Comparative case analysis of leadership and evaluative capacity (2027)
- Paper 4: Development of a conceptual model, The River of Utilisation, illustrating how insight flows through relationships, time, and governance (2028)

Results: Early analysis suggests that successful evaluation use is relational, emotional, and iterative. Use emerges where curiosity, care, and translation coexist, and where spaces for reflection are intentionally created. Evaluative learning travels through trust, dialogue, and shared sense-making rather than formal reporting mechanisms. Reflexivity itself became data, exposing tensions between independence and involvement, rigour and relevance, and the emotional labour of working at the research–practice boundary.

Conclusion: This realist perspective deepens understanding of how evaluative learning operates within the everyday dynamics of place-based physical-activity systems. It connects individual reflection with organisational adaptation

ORAL ABSTRACT SESSIONS

and system-level governance, showing that the use of evidence is itself a social process.

By illuminating these pathways, the research contributes new methodological and theoretical insights to systems research. It offers a conceptual framework for the *conditions for evaluating in systems* tackling physical-activity inequality and demonstrates how realist, utilisation-focused evaluation can bridge the research–practice divide, creating learning-led governance models that inform policy, investment, and decision-making in real time.

O.2.18-5

Understanding how Changes in Urban Design May Affect Physical Activity among Dutch Adults: Developing Causal Loop Diagrams with Group Model Building

S. van der Kaaij^{1,2}, G. Luijben¹, R. Prins¹, H. Kruize^{1,3}, L. Vaandrager²

¹National Institute for Public Health and the Environment, Bilthoven, Netherlands, ²Wageningen University and Research, Health & Society, Wageningen, Netherlands, ³University of Applied Sciences Utrecht, Utrecht, Netherlands

O.2.18 Systems Science: From Environment to Action: Systems Science for Health Behavior Change
Room 6, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Physical inactivity among adults continues to be a major issue worldwide. Physical activity is the result of interactions among various factors at multiple levels, with urban design playing an important role. Traditionally, research has focused on direct associations between urban design and physical activity. However, a more comprehensive understanding of how urban design affects activity levels calls for a systems thinking perspective. This study uses a systems thinking approach to map the complex relationships between urban design and physical activity.

Methods: Four group model building workshops were held: one each with residents and professionals in both Dordrecht and Utrecht. A total of 54 individuals participated, representing a blend of neighbourhood professionals (such as sport coaches and urban designers) and residents. The involvement of both professionals and residents ensured a balance between expert knowledge and resident experience. Participants worked together to construct causal loop diagrams, which visually illustrated the various factors and interrelationships that affect physical activity in their neighbourhoods.

Results: The workshops resulted in four causal loop diagrams. In each, both social and physical environmental factors emerged as important influences. For example, a higher presence of people in public spaces was associated with improved feelings of safety, which in turn encouraged outdoor activity. Policy interventions frequently served as balancing mechanisms within these systems; for instance, professionals might launch initiatives to promote physical activity, but these could be scaled back if activity levels rise. The analysis also revealed that professionals tended to prioritise policy and programmatic solutions, whereas residents highlighted day-to-day experiences and mental well-being.

Conclusion: The study shows that physical activity is shaped by both universal and neighbourhood-specific factors within the urban environment. The causal loop diagrams provide municipalities and neighbourhood professionals with valuable insights into which interventions can be implemented to stimulate physical activity, and how these may have effects throughout the system. Furthermore, combining the perspectives and factors identified by professionals and residents not only enriches understanding, but may also lead to innovative policy approaches tailored to the unique needs of each neighbourhood.

O.2.18-7

A Systems Evaluation of a Participatory Systems Approach to Promote Physical Activity: The Children's COOPERation Denmark (Child-COOP) Trial

T. Lockenwitz Petersen¹, K. Ryom², J. Nautrup Østergaard^{3,4}, C. Demant Klinker^{1,4}

¹Steno Diabetes Center Copenhagen, Department for Prevention, Health Promotion and Community Care, Herlev, Denmark, ²Aarhus University, Department of Public Health, Health Promotion and Intervention Research, Aarhus, Denmark, ³Steno Diabetes Center Aarhus, Aarhus University Hospital, Aarhus, Denmark, ⁴National Institute of Public Health, University of Southern Denmark, Copenhagen, Denmark

ORAL ABSTRACT SESSIONS

O.2.18 Systems Science: From Environment to Action: Systems Science for Health Behavior Change Room 6, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Addressing complex public health challenges, such as physical activity among children, entail an increase focus towards systems approaches that address interacting determinants at multiple levels. The Danish Child-COOP trial applies such a systems approach to promote physical activity in childhood. This study presents preliminary findings on early system-level changes, essential precursors to lasting individual behavior change.

Methods: The Child-COOP Denmark trial is a three-year, participatory systems approach based on group model building (GMB) workshops across five communities in five municipalities, with a total target population of 935 children aged 6–12 years across whole of Denmark. Child-COOP employs the IMPAcT process for system evaluation, this study reports on selected components only. The IMPAcT process integrates an Action Registry to track actions, with the Action Scales Model to identify leverage points, and Ripple Effects Mapping to track emergent change, and structured stakeholder reflections to support continuous adaptation. Actions registered through the IMPAcT process were systematically coded according to type, system level, and actor involvement.

Results: Twelvemonths after the final GMB workshop, a total of 67 actions were registered across the five municipalities (range: 6–27 activities per municipality). The majority were categorized as event-based actions ($n = 36$), followed by actions aimed at the structural level of the system ($n = 29$). Only two actions targeted higher system levels, such as goals or beliefs. Most actions were led by volunteers ($n = 25$), eighteen by professionals, and twenty-four represented collaborations between both. Twenty-one activities generated synergies across initiatives, reflecting clearer alignment between community efforts and existing strategies, and fostering effective cross-sector collaboration.

Conclusion: The results highlight significant variation in action levels across municipalities, with strong volunteer involvement and collaboration with professionals contributing to sustained momentum. Importantly, these findings provide early indications that a participatory systems approach may facilitate meaningful system-level change by mobilising local assets and strengthening alignment across sectors.

O.2.18-8

Probabilistic Interrelationships between 24-hour Movement Behaviours and Correlates of Different Domains: A Baeyesian Network Analysis

C. Martins¹, P.F. Bandeira²

¹Faculty of Sports, University of Porto, Porto, Portugal, ²Regional University of Cariri, Crato, Brazil

O.2.18 Systems Science: From Environment to Action: Systems Science for Health Behavior Change Room 6, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Studies on 24-hour movement behaviours in the early years are generally driven by linear models, overlooking the non-linear, and multifaceted interactions involving a high level of uncertainty between movement behaviours and its correlates. This study explored the probabilistic interrelationships between 24-hour movement behaviours and physical, motor, cognitive, sociodemographic, and environmental correlates through a complex systems approach.

Methods: A total of 146 Brazilian preschoolers (3-to-5 years) were measured for 24-hour movement behaviours (Actigraph wGT3x and parent-report); anthropometrics; sociodemographic variables; executive functions (Early Years Toolbox); motor skills (Test of Gross Motor Development - TGMD-2); and cardiorespiratory fitness (Shuttle-Run). Parents reported their perception of the neighborhood environment; and an auditory of the preschool environment was done. Bayesian Network Analysis was conducted based on a Directed Acyclic Graph, using the heuristic Hill-Climbing algorithm, and bootstrap analysis with 500 resamples. The analyses were performed in RStudio using the bnlearn and Rgraphviz packages.

Results: Results revealed that nighttime light exposure negatively impact sleep ($\beta = -11.83$). Sleep duration was also positively associated with ethnicity ($\beta = 17.94$), suggesting potential racial differences in sleep patterns. Screen time played a central role in the network, with multiple predictors and widespread effects. It was positively associated with ethnicity ($\beta = 31.59$) and nighttime light exposure ($\beta = 42.16$), and negatively associated with the number of siblings ($\beta = -42.99$) and executive function ($\beta = -3.13$). Light physical activity was positively associated with number of siblings ($\beta = 14.90$), though negatively associated with socioeconomic status ($\beta = -12.65$), and parent schooling level ($\beta = -7.45$). Moderate physical activity was mainly predicted by ethnicity ($\beta = -15.37$), and school day routines ($\beta = -6.80$); while vigorous physical activity showed positive associations with ethnicity ($\beta = 15.78$). Nighttime light exposure, executive function, and number of siblings emerged as critical nodes with the capacity to broadly influence the entire system.

Conclusion: The use of directed acyclic graphs and Bayesian networks allow for flexible and adaptable modeling of

ORAL ABSTRACT SESSIONS

causal and probabilistic relationships. Integrating these analytical tools can significantly enhance research in this field, supporting more robust inferences, and offering practical guidance for related disciplines.

O.2.19-1

Knowledge and Practices on Osteoporosis Prevention in Reproductive-age Women: A Study from Abia State, Nigeria

C. Uche^{1,2}, S. Ayuba^{2,3}, P. Obiokwu², J.E. Cade⁴

¹University of Leeds, United Kingdom, School of Food Science and Nutrition, Leeds, United Kingdom, ²Michael Okpara University of Agriculture Umudike, Human Nutrition and Dietetics, Abia, Nigeria, ³College of Health Science and Technology Michiki, Human Nutrition and Dietetics, Abia, Nigeria, ⁴University of Leeds, Nutritional Epidemiology Group, School of Food Science and Nutrition, Leeds, United Kingdom

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood
Room 7, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Osteoporosis is a skeletal disorder characterized by reduced bone density and microarchitectural deterioration, increasing fracture risk and reducing quality of life. Women of reproductive age are vulnerable due to modifiable lifestyle factors. Understanding knowledge, attitude, and practices (KAP) toward osteoporosis prevention is essential for targeted interventions. This study focused on assessing the knowledge, attitude, and practices related to osteoporosis risk factors among women of reproductive age in Ikwuano Local Government Area, Abia State, Nigeria.

Methods: A cross-sectional study was conducted among 204 women selected through multi-stage sampling from four communities. Data were collected using a validated questionnaire covering socio-demographics and KAP regarding osteoporosis. Knowledge was assessed using the Osteoporosis Knowledge Assessment Tool, while attitude and practice were measured using Likert-scale items. Data were analysed using SPSS version 22 with descriptive statistics and Chi-square tests.

Results: Respondents were predominantly aged 15–25 years (50.5%) and single (70.1%), with most earning less than ₦30,000 monthly (83.3%). Knowledge was poor: 51.0% had never heard of osteoporosis, and only 36.3% correctly identified its definition. Attitude scores were also low, with 52.5% classified as poor. In contrast, practice scores were relatively good: 76.5% demonstrated positive behaviours such as avoiding smoking (98.5%) and consuming calcium-rich foods (milk and leafy vegetables). However, only 27.9% reported taking preventive measures like exercise or calcium supplementation. Health workers were the main source of information (28.0%).

Conclusion: Women of reproductive age in Abia State exhibit poor knowledge and attitude but relatively good practices toward osteoporosis prevention. Awareness campaigns and community-based education programs are recommended to improve knowledge and attitudes, leveraging social media and continuous medical education for health professionals.

O.2.19-2

Perceived Built Environment and Health Behaviors among Young Adults: A Multi-country Citizen Science Study Using TravelTrack

B. Goedons¹, B. De Wit², J. Verdoodt², J.-M. Oppert^{3,4}, A. Bellicha³, H. Charreire⁵, S. C. Hu^{6,7}, N. Ching Huang⁸, M. Kirschner⁹, M. Nicolaou⁹, G. Cardon¹

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood
Room 7, May 29, 2026, 12:00 PM - 1:00 PM

ORAL ABSTRACT SESSIONS

Purpose: Built environments influence physical activity and unhealthy diets through factors such as mobility, safety, and access to healthy food, yet supportive conditions remain unequally distributed. Within the Young Adults in Health-enhancing Equitable Environments (YAHEE)-project, TravelTrack was developed as a citizen science web tool enabling young adults to map commuting routes and evaluate perceived mobility and food environments. This study investigates how young adults across four countries perceive their commuting environments and examines whether these perceptions—such as safety, cost, convenience, and food healthiness—are associated with self-reported active travel and food purchasing behaviors.

Methods: This cross-sectional study (2024–2025) was conducted in Belgium, the Netherlands, France, and Taiwan among 1,000 young adult students (18–25 years) from low socioeconomic neighbourhoods recruited through vocational schools and universities. Using TravelTrack, participants mapped daily commuting routes between their residence and educational institutes, rated perceived safety, attractiveness, and the importance of mobility- and food-related factors, and reported main travel mode and frequency of food purchases. Descriptive and comparative analyses assessed cross-country differences, while mixed-effects models examined associations between perceived environmental factors and behaviors, accounting for clustering within schools and countries.

Results: Preliminary findings (Belgium and Taiwan, $n=616$) revealed significant cross-country differences in commuting behaviors ($p<0.001$) and perceptions (most $p<0.001$). In Taiwan, walking (36.7%) and motorbike use (46.7%) were the main travel modes, reflecting short distances and high motorbike accessibility, while Belgian participants primarily commuted by car (33.5%), public transport (29.0%), or bicycle (16.5%). Both samples reported convenience and safety as the most important factors when choosing their travel mode, and taste and price as the strongest influences on dietary behavior. Compared with Belgian participants, Taiwanese participants rated nearly all mobility- and food-related factors as more important. Analyses including all four countries will be presented.

Conclusion: Strong contrasts in commuting behaviors and perceptions between Belgium and Taiwan emphasize the importance of local contexts in shaping mobility and food-related choices and demonstrate the need for context-specific approaches when designing intervention. TravelTrack shows how citizen science can capture such nuanced, place-based insights with the potential to support policies that promote healthier, more equitable, and sustainable urban environments in young adults.

O.2.19-3

Associations between Social Background, Food Security and Diet Quality among Students in France: A Cross-sectional Representative Study

W. Bariz¹, H. Dehove¹, J. Baudry¹, E. Kesse-Guyot¹, C. Julia¹, M. Touvier¹, J.-M. Oppert¹, S. Péneau¹, M. Mofakhami², A. Bellicha¹

¹Université Sorbonne Paris Nord, Université Paris Cité, Inserm, INRAE, CNAM, Nutritional Epidemiology Research Team (EREN), Centre for Research in Epidemiology and Statistics (CRESS), Bobigny, France, ²Université Sorbonne Paris Nord, Institute for Interdisciplinary Research on Social Issues (IRIS), Bobigny, France

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood

Room 7, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: In countries such as France, the higher education system tends to reproduce social inequalities, with students' social background shaping both access to higher education and academic achievement, a pattern that may also influence dietary behaviors. We aimed to analyze the associations between students' social background, food security and diet quality and to evaluate whether these associations were influenced by student's daily living conditions.

Methods: Cross-sectional data were collected in 2024 by the French Observatory of Student Life among a representative student population. Food security was assessed using the short-form U.S. Household Food Security Survey Module (total score categorized in three classes: food security, low, or very low food security). The frequency of consumption of 15 food groups was assessed using a short food frequency questionnaire, and a diet quality score was computed (and categorized in tertiles, a higher score reflecting greater diet quality). Social background was assessed through parental household occupational status. Associations of social background with food security and diet quality were assessed using multivariable logistic regressions (ordinal and multinomial, respectively). Model 1 was adjusted for sociodemographic and academic characteristics (sex, age, study level, nationality, type of high school diploma, field of study). Model 2 was additionally adjusted for daily living conditions (living with parents, job, financial difficulties, scholarship, use of food assistance).

Results: This study included 5024 students (57% women, mean [SD] age 23.3 [3.9]), 32% with privileged social

ORAL ABSTRACT SESSIONS

background). Overall, 14% and 16% students reported very low and low food security, respectively. Social background was significantly associated with food security and diet quality: in model 1, disadvantaged social background was associated with lower food security (OR [95% CI] 3.24 [2.51-4.18]) and lower diet quality (OR [95% CI]=1.45 [1.05-2.02]). Associations were slightly attenuated in model 2 (OR [95% CI]=1.89 [1.40-2.56]; 1.47 [1.04-2.07], respectively).

Conclusion: Social background was associated with students' food insecurity and lower diet quality, independent of their sociodemographic characteristics. Accounting for students' daily living conditions slightly attenuated these associations, but did not eliminate them. These findings suggest that students' diets are shaped not only by material limitations but also by cultural and institutional influences, like parental food education.

O.2.19-4

Moving Out: The Impact of Leaving the Parental Home on Diet Quality Trajectories among Australian Adolescents and Young Adults (14-27 Years)

T. Braune^{1,2}, J.K. Barrett³, J. Adams², E.M. Winpenny¹

¹Imperial College London, School of Public Health, London, United Kingdom, ²University of Cambridge, MRC Epidemiology Unit, Cambridge, United Kingdom, ³University of Cambridge, MRC Biostatistics Unit, Cambridge, United Kingdom

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood

Room 7, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Adolescence and early adulthood are life stages marked by major life transitions. One transition which may influence dietary behaviours and related health risks is that of leaving the parental home. This study examined diet quality trajectories from adolescence into early adulthood and the influence of the transition out of the parental home and into different living arrangements on diet quality.

Methods: Data were drawn from 1,135 participants aged 14 to 27 years in the Raine Study (Australia), who completed food frequency questionnaires at up to five follow-ups: 14, 17, 20, 22 and 27 years. Diet quality was assessed using (i) the Dietary Approaches to Stop Hypertension (DASH) diet score and (ii) the proportion of total energy intake from discretionary foods and beverages. Multilevel regression models examined trajectories of diet quality with age, investigating interactions with leaving the parental home and subsequent living arrangements (partner, friends or alone).

Results: Diet quality was generally poor and followed a quadratic trajectory with lowest diet quality seen at around age 20 years. Leaving the parental home was associated with a decrease in diet quality, reflected in a lower DASH diet score: $\beta = -0.97$ [95% CI: -1.65, -0.28]; and increased discretionary food intake: $\beta = 1.05$ [95% CI: 0.08, 2.02]. The initial decrease in diet quality persisted with age for DASH diet score and diminished for discretionary food intake. Moving in with a partner was associated with the greatest decrease in DASH diet score: $\beta = -1.02$ [95% CI: -1.91, -0.14].

Conclusion: Leaving home, particularly to live with a partner, is associated with poorer diet quality. Public health strategies targeting life transitions may help support healthier dietary behaviours in adolescents and young adults. Further research should investigate mechanisms, exploring timing of transitions and motivations for food choices in different living arrangements during this critical developmental stage.

O.2.19-5

Engagement with Food-related Videos on Social Media: A Qualitative Comparison of Young Adults' Experiences in Jamaica and the United Kingdom

S. Parks¹, J. Renzella², A. Kaur², S. Soares-Wynter³, M. Rayner¹, C. Albury², P. Scarborough²

¹University of Oxford, Nuffield Department of Population Health, Oxford, United Kingdom, ²University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, ³University of the West Indies, Caribbean Institute for Health Research, Kingston, Jamaica

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood

Room 7, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: The rise of video-based social media platforms and the shift towards a video-first content strategy by social media companies have altered how people consume and engage with food-related content. However, little is known

ORAL ABSTRACT SESSIONS

about how young adults experience and interpret these influences across national and cultural contexts. This study presents a novel cross-national comparison and develops a conceptual understanding of how and why young adults engage with food-related videos on social media, and how these interactions influence their food attitudes and behaviours in Jamaica and the United Kingdom.

Methods: Twelve focus groups were conducted between July and November 2024 with young adults aged 18–25 years (six in Jamaica and six in the UK). Discussions explored their experiences with food-related content. Transcripts were analysed using reflexive thematic analysis, complemented by framework analysis and the constant comparison method to facilitate cross-national and cross-cultural comparison.

Results: Analysis generated four themes: (1) young adults balance algorithmic influence with personal curation; (2) young adults engage with food-related videos for relaxation, amusement, and learning; (3) young adults evaluate food-related content through enquiry and strategy; and (4) food choices form at the intersection of online and offline worlds. A unified high-order theme, “A Journey of Influence,” captures how young adults move from exposure to evaluation and filter digital experiences through offline realities, leading to either change or continuity in dietary attitudes and behaviours. Although this journey was consistent across Jamaica and the UK, its expression reflected cultural differences: Jamaican participants often gauged food content through the lens of Jamaica’s food culture, whereas UK participants displayed a broader diversity of cultural perspectives on food.

Conclusion: This study conceptualises the influence of food-related videos as a dynamic process that unfolds across digital and offline environments. Our conceptual map is among the first to visualise this process for young adults, identifying three decision points for change where reflection and action converge, namely: exposure, evaluation, and contextualisation. These insights highlight opportunities to design youth-responsive digital nutrition interventions that leverage these inflexion points to guide young adults towards real-world dietary shifts.

O.2.19-6

Nourishing Student Wellbeing: Behavioral, Social, and Operational Insights from an Urban College Food Pantry

J. Blouin¹, E. Wu², H. Sadig³, K. Steigman⁴, G. Jordan⁵, J. Sacheck⁶, G. Headrick¹

¹The George Washington University, Exercise and Nutrition Sciences, Washington, D.C., United States, ²The George Washington University, Medicine and Health Sciences, Washington, D.C., United States, ³The George Washington University, Global Health, Washington, D.C., United States, ⁴The George Washington University, Washington, D.C., United States, ⁵The George Washington University, Prevention and Community Health, Washington, D.C., United States, ⁶Brown University, Behavioral and Social Sciences, Providence, R.I., United States

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood
Room 7, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Food insecurity, defined as limited or uncertain access to safe and nutritious food, is a pressing public health issue among university students, especially in high-cost urban settings. However, a critical gap remains in understanding why and how students at urban universities rely on campus food pantries and whether these resources truly meet their needs. This study investigated how students utilize their campus food pantry at a large urban university in the United States, with insights on the behavioral, social, and operational factors that shape food access and inform their basic-needs decisions.

Methods: We conducted a qualitative study using five semi-structured focus groups and four in-depth interviews involving 20 pantry users. All sessions were audio-recorded, transcribed verbatim, and checked for accuracy. We used Atlas.ti (version 25.0.1) for deductive and inductive coding focused on food pantry discovery, motivations for use, shopping behaviors, food quality, perceived stigma, operational barriers, and recommendations for improvement. We approached thematic analysis using a phronetic iterative approach and strengthened rigor by comparing memos, discussing coding with a third researcher, and cross-checking themes across interview types.

Results: Key themes emerged in three domains: behavioral, social, and operational determinants of use. First, students relied on the pantry as a supplemental food source due to high living costs, cooking constraints, and busy schedules. Additionally, inconsistent stock, restricted availability, and food quality concerns influenced shopping behaviors. Second, most students reported minimal stigma, yet undergraduates expressed greater concerns about privacy and social judgment. Third, operational barriers, including communication gaps, limited hours, and item distribution systems, further reduced access. Overall, participants’ recommendations included real-time stock updates, extended hours, improved food handling, and greater cultural and dietary accommodations.

ORAL ABSTRACT SESSIONS

Conclusion: This study explores college food insecurity beyond access, focusing on students' consistent, equitable, and comfortable use of campus resources. Food pantry improvements should prioritize accessibility, convenience, quality, and inclusivity in both stock and operations. These findings provide actionable guidance and challenge academic institutions to rethink basic-needs interventions as dynamic, student-centered systems.

O.2.19-7

Adapting a Campus Mobile Produce Market: Feasibility, Acceptability, and Main Outcomes of the 2024–2025 Campus Veggie Van Pilot

A. Tutasí-Lozada¹, L. Leone¹, L. Vermont¹

¹University at Buffalo, Community Health and Health Behavior, Buffalo, United States

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood
Room 7, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Improving access to fruits and vegetables (FV) among postsecondary students may improve food security (FS). Building on a 2023 pilot, we adapted the Veggie Van (VV) model, an evidence-based mobile market developed to increase access to FV in underserved communities, to a college campus. The intervention combines weekly mobile markets with financial incentives, nutrition education, and community partnerships to increase FV consumption. We evaluated feasibility, acceptability, and participant outcomes while highlighting the participatory adaptation process.

Methods: An academic year (2024–2025) pre-post pilot was conducted with 125 food-insecure students at a large US public university. Weekly mobile markets provided \$5 weekly shopping incentives, discounted produce bundles, and a weekly online newsletter. Key implementation adaptations included improved location and hours, increased social media presence, smaller bundles, expanded offerings (dairy, eggs), and co-design via a Student Advisory Board (SAB). Quantitative outcomes included FV intake (dermal carotenoids with the Veggie Meter®) and USDA FS (10-item). Implementation outcomes (reach, feasibility, acceptability) were assessed through a point-of-sales system, SAB meetings, and three post-intervention focus groups. Analyses included pre-post comparisons, stratified by VV usage (visits to market), and summarizing qualitative data.

Results: Approximately 40% of study participants visited the market at least once per month, averaging 7.3 visits (over twice as often as non-participant student customers). Compared to students who used the VV less than once per month, adjusted linear mixed-effects models indicated significant improvements among frequent users in FV intake (+29.5, $p = .001$, $d = .84$) and FS (-2.7, $p < .001$, $d = -.34$). Students regularly used their full weekly discount. Focus group findings highlighted high acceptability: students praised the freshness, affordability, and on-campus convenience of the market. The expanded product offerings and promotional strategies (shaped by ongoing input from SAB) further enhanced engagement. Remaining barriers included limited student time, competing schedules, and market awareness gaps.

Conclusion: Compared to the initial pilot, this academic year-long implementation achieved stronger engagement, with frequent users integrating the VV into weekly food procurement. Significant gains in FV intake and FS suggest that student co-design, incentives, and improved access make the Campus VV a feasible, scalable strategy to enhance campus FS.

O.2.19-8

Co-designing a Theory-based Digital Behaviour Change Intervention to Improve Wellbeing in Young Adult University Students

J. Ruiz¹, A. Metse¹, D. Wadsworth¹, C. Jona¹, C. Askew¹, H. Wright¹, L. Gallo¹

¹University of the Sunshine Coast, School of Health, Brisbane, Australia

O.2.19 Young adult: Health in Transition: Navigating Diet and Wellbeing in Young Adulthood
Room 7, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Young adults are in a transitional life stage often marked by unhealthy lifestyle behaviours, including low adherence to dietary guidelines, high psychological distress and insufficient strength-based physical activity. Understanding the barriers and facilitators to healthier lifestyle habits, and intervention preferences is essential for designing health promotion strategies aligned with students' needs. This project aimed to identify barriers, facilitators, and intervention preferences to inform a co-designed theory-based digital behaviour change prototype for young adult

ORAL ABSTRACT SESSIONS

university students.

Methods: The study comprised three stages using a mixed-method approach. Stage one involved quantitative assessments of barriers and facilitators for physical activity (DPAQ questionnaire), diet (adapted DPAQ), and intervention preferences (custom survey) (n=76). Stage two collected qualitative data through focus groups (n=6 in each of two groups) to complement quantitative findings and capture additional insights regarding stress management behaviours. Data from both stages were analysed using the Theoretical Domains Framework (TDF) to identify behavioural determinants, which were mapped to Behaviour Change Techniques (BCTs) that informed the last stage. Stage three comprised three co-design workshops with students, researchers, digital and health professionals, guided by the PROCEDURES framework and design thinking principles to develop a prototype intervention.

Results: Key barriers included limited time and busy schedules affecting diet, physical activity and stress management, while social support emerged as key facilitator for motivation and adherence. Barriers and facilitators were aligned to 11, 9, and 7 TDF domains for diet, physical activity, and stress management respectively. Relevant BCTs, such as “Restructuring the physical environment”, were then selected in consultation with co-designers to inform prototype features, such as time and context-efficient workouts, recipes, and relaxation activities. Students preferred a digital app featuring text, image and video content with 2-3 updates per week and optional in-person support, prioritising mental wellbeing (39%), sleep (20%), physical activity (19%), and diet (16%).

Conclusion: This study identified key barriers (e.g., time constraints), facilitators (e.g., social support) and student preferences for an app-based intervention targeting mental wellbeing, sleep, diet and physical activity. Combining behavioural theory with participatory co-design, this project developed a theory-informed digital prototype offering a novel, user-driven approach to promote wellbeing among university students.

O.2.20-2

Parks as Active Living Assets for Stroke Prevention: The Protective Association between Residential Park Area and Incident Stroke in a US-based Prospective Cohort Study

I.-M. Lang¹, Z. Zhang², S.E. Judd³, L.E. Robinson¹, N. Colabianchi^{1,4}

¹University of Michigan, School of Kinesiology, Ann Arbor, United States, ²Peking University, Department of Physical Education, Beijing, China, ³University of Alabama at Birmingham, School of Public Health, Department of Health Behavior, Birmingham, United States, ⁴University of Michigan, Institute for Social Research, Ann Arbor, United States

O.2.20 Policies and environments: Public Spaces, Beverages and Fiscal Tools for Healthier Diets and Activity
Room 8, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Parks are recognized as important public assets that facilitate physical activity, but their association with distal health outcomes, such as stroke, are not well established. Demonstrating that active living assets have benefits that reach beyond behavior, substantially strengthens the incentive for communities, clinicians, and policy makers to invest in and promote active living features as tools for promoting overall human health and well-being. This study helps fill this gap by examining whether the residential availability of parks is associated with a lower risk of incident stroke.

Methods: This United States-based prospective study used data on 21,874 middle and older age adults who self-identified as White or Black and were enrolled in the ongoing REasons for Geographic And Racial Differences in Stroke (REGARDS) Study. The primary exposure was the availability of park area within a 1km radial buffer around geocoded home addresses and was dichotomized using 0.5 hectares of park area as a cut-point (the approximate size of an American football field). The outcome was clinically adjudicated incident stroke. Hazard models were estimated with 95% confidence intervals. Model 1 adjusted for demographics, Model 2 made additional adjustments for socioeconomic factors, and Model 3 made further adjustments for health factors.

Results: In Model 1, having at least 0.5 hectares of park area within 1km of one's home was associated with a 21% lower hazard of incident stroke (HR: 0.79; 95% CI: 0.70-0.90; p<.001). In Models 2 and 3, having at least 0.5 hectares of park area within 1km of one's home was associated with an 18% lower hazard of incident stroke (HR: 0.82; 95% CI: 0.72-0.94; p=.003).

Conclusion: The results provide novel evidence of the long-term health benefits of active living features. Specifically, our findings show that parks, which are known to support proximal health behaviors such as physical activity, are also protective against distal adverse health outcomes, including incident stroke. These findings strengthen the value proposition for investing in active living environments and uniquely highlight parks as a key feature with the potential to be leveraged as a preventive medicine tool for preventing physical inactivity-related diseases, such as stroke.

ORAL ABSTRACT SESSIONS

O.2.20-3

How Meat Taxation Is Framed in German News Media: An Analysis of Themes and Stakeholders

A. Leibinger¹, K.S. Moerschel¹, A. Hagge¹, L. Fesenfeld², B. Hawkins³, P. von Philipsborn^{4,1}

¹LMU Munich / Institute of Medical Information Processing, Biometry and Epidemiology (IBE), Chair of Public Health and Health Services Research, Munich, Germany, ²University of Bern / Oeschger Centre for Climate Change Research, Bern, Switzerland, ³University of Cambridge, MRC Epidemiology Unit, Cambridge, United Kingdom, ⁴University of Bayreuth, Chair of Public Health Nutrition, Bayreuth, Germany

O.2.20 Policies and environments: Public Spaces, Beverages and Fiscal Tools for Healthier Diets and Activity
Room 8, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: In many high-income contexts, consumption of animal-based foods remains higher than levels advised for environmental sustainability and public health. Fiscal instruments such as taxes have been discussed as potential levers to shift consumption patterns, yet these proposals face political and societal backlash. Public debates, and in particular media framing, can shape perceptions of the legitimacy and feasibility of such policies. This study examines how the taxation of animal-based foods is represented and contested in German media, identifying central actors, dominant narrative frames, and the arguments that support or challenge different tax models. The research contributes novel insights into how value-based reasoning and policy design considerations influence discursive support for or opposition to these measures.

Methods: We conducted a qualitative media analysis of German newspaper and trade press coverage concerning proposals for taxes and levies affecting the price of animal-based foods. The dataset comprised 488 articles published between February 2019 and July 2023 in ten national daily newspapers and eight trade press publications. Using an inductive coding approach, we identified key stakeholder groups, mapped recurring argumentative themes, and analyzed how policy instruments were framed. Coding reliability and thematic interpretation were refined through team-based discussion and cross-checking.

Results: Positive framing of taxation most frequently centered on expected improvements in animal welfare and environmental protection, while health benefits were referenced less prominently. Support for taxation was not confined to traditionally progressive actors; it also appeared among agricultural producers, industry representatives, and conservative political figures, particularly where revenues were proposed to be earmarked for animal welfare improvements. This alignment around animal welfare provided a cross-cutting justification that could bridge ideological divides. By contrast, opposing frames emphasized risks of exacerbating socioeconomic inequalities, questioned the effectiveness of a tax, or argued that regulatory measures would be preferable.

Conclusion: Policy designs and communication strategies that emphasize shared priorities—in this case animal welfare—may reduce polarization and increase support for taxation of animal-based foods. Clear and credible mechanisms for revenue use can address equity and efficacy concerns. In the German setting, limitations on revenue earmarking and rising inflation rates seem to have reduced political momentum for adopting the tax.

O.2.20-4

Dedicating Public Open Space to Physical Activity: Evidence from 379,000 Adults in the Netherlands

R. Prins¹, K. Pulles¹, M. van Muijden¹, H. Lakenvelt-Verbree¹, M. Strak¹

¹National Institute for Public Health and the Environment, Bilthoven, Netherlands

O.2.20 Policies and environments: Public Spaces, Beverages and Fiscal Tools for Healthier Diets and Activity
Room 8, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: The Netherlands is becoming increasingly urbanised, and policymakers have adopted a densification strategy that puts pressure on multifunctional public open spaces. A new Dutch guideline proposes that 25% of public open space should be dedicated to physical activity (walking, cycling, playing, and sports). However, no studies have yet examined whether this allocation is associated with sufficient physical activity among residents. This study investigates the relationship between the proportion of public open space (POS) dedicated to physical activity and compliance with the Dutch Physical Activity (PA) Guideline (≥ 150 minutes/week moderate-to-vigorous PA and ≥ 2 days/week muscle- and bone-strengthening activities).

ORAL ABSTRACT SESSIONS

Methods: We analysed cross-sectional data from the Dutch Health Monitor 2024 (N=379,439 adults), assessing PA Guideline compliance using the SQUASH questionnaire. For each participant, the proportion of public open space dedicated to physical activity (PA-POS) within a 1,000-metre crow-fly buffer of the residence was calculated. Spatial data were sourced from the Large-Scale Topography Map (BGT) and enriched with OpenStreetMap and the Dutch Outdoor Play Map to include playgrounds. The percentage was defined as the combined area of pavements, cycling infrastructure, play infrastructure, and sports facilities in open space divided by the total public open space.

Generalised Additive Mixed Models (GAMMs) with a spline term examined the association between PA Guideline compliance and the proportion of PA -POS, as well as compliance with the proposed 25% guideline. Models were adjusted for age, gender, education, income, neighbourhood satisfaction, living status, migration status, and neighbourhood socioeconomic status, with neighbourhood as a random intercept. Stratified analyses were conducted for neighbourhood types defined by amount of POS and population density.

Results: A positive association was found between the proportion PA-POS and PA Guideline compliance, starting at 20% and increasing linearly up to 55%. Residents with more than 25% of PA-POS were more likely to comply (OR: 1.07; 95% CI: 1.03-1.10). Associations were strongest in neighbourhoods with less POS and higher population density.

Conclusion: Dedicating a higher proportion of PA-POS is associated with greater compliance with PA Guidelines among Dutch adults. Urban planners and policymakers should consider allocation of PA-POS to promote PA. Future research is needed to confirm our findings.

O.2.20-5

Warning Labels for Non-nutritive Sweeteners: Impacts on Chilean Parents' Choices and Perceptions

A. D'Angelo Campos¹, N. Rebolledo², A. Sylvetsky³, L. Smith Taillie¹

¹University of North Carolina at Chapel Hill, Chapel Hill, United States, ²Instituto de Nutrición y Tecnología de los Alimentos, Universidad de Chile, Santiago, Chile, ³George Washington University, Washington DC, United States

O.2.20 Policies and environments: Public Spaces, Beverages and Fiscal Tools for Healthier Diets and Activity
Room 8, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: In 2016, Chile mandated that products high in sugar carry warning labels. Following this policy, use and consumption of non-nutritive sweeteners (NNS) increased, raising concerns about NNS intake among children. Chile is now considering adding a text warning to NNS-containing products ("CONTAINS NON-SUGAR SWEETENERS, AVOID CONSUMPTION AMONG CHILDREN"). However, this and other NNS labeling approaches – e.g., Colombia's "CONTAINS NON-SUGAR SWEETENERS" stop signs – have never been empirically tested.

Methods: In 2025, Chilean parents of children ages 2-14 (n=3,523) completed an online experiment. Participants were randomly assigned to see either no NNS label (control), Chile's proposed NNS label, or Colombia's NNS label on NNS-containing products. Participants saw products (one without added sweeteners, two sugar-sweetened, two NNS-sweetened) and were asked to select one for their child, to identify NNS-containing products, and, afterwards, to report which labels they saw. Next, participants saw NNS-containing products and rated the NNS labels' perceived message effectiveness (PME) and products' healthfulness. Lastly, participants rated their intentions to limit their children's future NNS intake. We report average differential effects (ADEs) compared to control in percentage points (pp) or on scales ranging from 1 (low) to 5 (high).

Results: Both the Chile (ADE=67pp, p<0.001) and the Colombia (ADE=69pp, p<0.001) labels led to higher identification of NNS-containing products. Both labels led to *lower* selection of NNS-containing products (Chile label ADE range=22-35pp; Colombia label ADE range=22-33pp; all p<0.001) and to *higher* selection of products without added sweeteners (Chile label ADE range=20-35pp; Colombia label ADE range=22-31pp; all p<0.001). Neither label led to higher selection of sugar-sweetened products. Afterwards, 63% of participants in the Chile NNS label condition and 84% in the Colombia NNS label condition reported seeing NNS labels (p<0.001). Lastly, both labels led to *higher* PME (Chile label ADE=1.53; Colombia label ADE=0.92, both p<0.001), *lower* product healthfulness perceptions (Chile label ADE=1.43, Colombia label ADE=0.81, both p<0.001), and *higher* intentions to limit children's NNS intake (Chile label ADE=0.66, Colombia label ADE=0.17, both p<0.001).

Conclusion: NNS labels greatly improved parents' NNS identification and led to healthier product choices for their children, showing promise for curbing NNS intake in this vulnerable population.

O.2.20-6

Assessing Gaps in Food Security Status by Exposure to Crime at Food Stores: An Oaxaca-blinder Decomposition Analysis

C. Singleton¹, D. Gartner¹, G. Headrick², F. Winata³, K. Sheehan⁴, D. Rose¹

¹Tulane University, Department of Social, Behavioral, and Population Sciences, New Orleans, United States, ²George Washington University, Department of Exercise and Nutrition Sciences, Washington D.C., United States, ³Texas A&M University, Department of Geography, College Station, United States, ⁴Northwestern University, Department of Pediatrics, Chicago, United States

O.2.20 Policies and environments: Public Spaces, Beverages and Fiscal Tools for Healthier Diets and Activity
Room 8, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Food insecurity is a persistent issue that affects 14% of U.S. households. Previously, we found that U.S. adults who are exposed to crime at food stores in their community (e.g., grocery stores, dollar stores) are more likely to be food insecure than those unexposed. Given the novelty of this finding, there is little evidence in the literature that describes the drivers of this disparity. To address this gap, we assessed demographic, socioeconomic, and health factors that may explain the disparity using Oaxaca-Blinder (O-B) decomposition.

Methods: We analyzed cross-sectional survey data collected in 2024. The sample included 1,518 adults (mean age: 50; 52% female) who self-reported their demographics and history of exposure to crime at food stores in their community. Food security status was measured using the 6-item US Food Security Module. Respondents who stated they were a witness OR victim of crime at a food store were labeled as “exposed”; all other respondents were “unexposed”. We ran a multivariable logistic regression model to confirm that exposure status was associated with higher odds of food insecurity in this sample (OR: 2.04; 95% CI: 1.48-2.82). Afterwards, we ran several O-B models in Stata 16.1 using the *Fairlie* command to (1) identify factors that contributed to the food security disparity by exposure status (2) quantify the portions of the disparity that were explained by our factors of interest.

Results: Approximately 331 (21.8%) respondents reported exposure to crime at food stores. The O-B model estimated the predicted prevalence of food insecurity to be 72% among those exposed and 39% among those unexposed (a disparity of 33 percentage points). The O-B model that only included age, sex, and race/ethnicity explained 7 percentage points (21%) of the difference. The addition of marital status, number of children, education level, annual income, employment status, car access, and stress score to the O-B model increased the explained portion to 13 percentage points (39%).

Conclusion: While selected demographic, socioeconomic, and health factors explain 39% of the disparity in food security status, a large portion remained unexplained. Future studies should explore the contribution of community- and store-level factors.

O.2.20-7

The Public Health Index: Development of a Benchmarking Tool to Assess the Implementation of Evidence-based Public Health Policies and Application to 18 European Countries

O. Huizinga¹, S. Rabe¹, U. Mons², K. Schaller², J. Manthey³, C. Kilian^{3,4}, P. Gelius⁵, P. von Philipsborn^{6,6}

¹AOK Bundesverband, Berlin, Germany, ²German Cancer Research Centre (DKFZ), Heidelberg, Germany, ³University Hospital Hamburg, Hamburg, Germany, ⁴University of Southern Denmark (SDU), Odense, Denmark, ⁵Université de Lausanne, Lausanne, Switzerland, ⁶University of Bayreuth, Chair of Public Health Nutrition, Bayreuth, Germany

O.2.20 Policies and environments: Public Spaces, Beverages and Fiscal Tools for Healthier Diets and Activity
Room 8, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Unhealthy diets, physical inactivity, alcohol consumption, and tobacco use account for a substantial share of the disease burden globally. We aimed to develop a benchmarking tool to systematically assess the implementation of evidence-based policies addressing these four major risk factors internationally, and to apply it to 18 European countries.

Methods: We systematically searched for existing benchmarking tools, frameworks and indices, and identified

ORAL ABSTRACT SESSIONS

suitable existing benchmarking tools for alcohol and tobacco policy. For unhealthy diets, a new index was developed assessing the implementation of health-related food and beverage taxes, nutrition labelling, marketing regulations, and school nutrition standards. Policy databases including the NOURISHING database and the WHO Global Database on the Implementation of Food and Nutrition Action were used as data sources. For physical inactivity, we developed a new index based on the WHO Global Status Report on Physical Activity 2022, integrating data from the WHO NCD Country Capacity Survey 2021 and the WHO Global Status Report on Road Safety. The four sub-indices were then integrated to form an overarching index ranging from 0 (no implementation of any policies) to 100 (full implementation of all policies). We then applied the index to 18 European countries.

Results: Among the 18 countries assessed, the Public Health Index Score ranged from 32 to 72, with a median score of 50 (interquartile range: 43-64). The highest scoring countries (score ≥ 60) included the United Kingdom, Finland, Ireland, Norway, France and Lithuania, and the lowest scoring countries (score ≤ 40) were Luxembourg, Austria, Germany and Switzerland. Scores across the domains of nutrition, alcohol and tobacco policy were correlated, and the lowest scoring countries showed low scores across domains. Scores in the physical activity policy varied less across countries, and correlated less with the scores in the other three domains.

Conclusion: The newly developed Public Health Index allows for a structured and systematic comparison of the implementation of evidence-based policies for addressing unhealthy diets, tobacco and alcohol use, and physical inactivity across countries and risk factor domains. In our sample of 18 European countries, policy implementation varies considerable, and substantial implementation gaps are evident across all countries.

O.2.20-8

International Differences in Sweetener Use in Ready-to-Drink Beverages: An Online Market Scan of Australia, Canada, Chile, Mexico, United Kingdom, and United States Retail Sources

K. Hock¹, M. Iraniparast¹, S. Kirkpatrick¹, V.L. Rynard¹, G. Sacks², L. Vanderlee³, D. Hammond¹

¹University of Waterloo, Waterloo, Canada, ²Global Centre for Preventive Health and Nutrition (GLOBE), Institute for Health Transformation, Deakin University, Geelong, Australia, ³École de Nutrition, Centre Nutrition, Santé et Société (Centre NUTRISS), and Institut sur la Nutrition et les Aliments Fonctionnels (INAF), Université Laval, Québec, Canada

O.2.20 Policies and environments: Public Spaces, Beverages and Fiscal Tools for Healthier Diets and Activity
Room 8, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Non-nutritive sweeteners (NNS) are increasingly used in beverages worldwide, driven by consumer and government demand for low sugar/low-calorie options. However, as little is known about their use across countries and beverage categories, this study examined cross-country and cross-category sweetener use.

Methods: A market scan of non-alcoholic, ready-to-drink beverages was conducted across six countries (Australia, Canada, Chile, Mexico, the United Kingdom (UK), and the United States (US)) between October 2023 and February 2025. The sample included 14,785 beverages collected from retailer and manufacturer websites via web scraping with available ingredient lists and nutrition labels. Descriptive statistics and binary logistic regression models compared sweetener use (i.e., NNS and added sugar) across countries and categories.

Results: Overall, 7.6% of beverages contained no sweeteners or intrinsic sugars, 27.7% had intrinsic sugars (e.g., milk-/juice-derived), 36.7% contained NNS (alone/with added or intrinsic sugars), 49.7% contained added sugar (alone/with NNS), and 66.3% contained free sugar (e.g., added/juice-derived intrinsic sugars). Over half of beverages (58.0%) contained multiple sweeteners and 34.5% contained combinations involving NNS. NNS use was highest in countries with mandatory sugary drink taxes and/or front-of-package nutrition labels (Chile: 64.5%; the UK: 48.8%; Mexico: 45.4%), and lowest in countries without mandatory national-level policies (the US: 36.1%; Australia: 23.3%; Canada: 16.4%; all $p < 0.001$ vs Chile). Added sugar use was lowest in Chile (40.2%), followed by Australia (40.2%), the UK (49.6%), the US (50.3%), Canada (52.7%), and Mexico (61.0%; all $p < 0.05$ vs Chile, except Australia). By category, NNS were most common in energy drinks (75.2%), followed by sports drinks (49.5%), soft drinks (46.6%), dairy & alternative (18.6%), coffee (18.0%), and low/no-alcohol beverages (16.26%; all contrasts $p < 0.05$ vs energy drinks). Added sugars were least common in water (25.2%), followed by dairy & alternative (45.2%), juice (47.4%), sports (66.1%), low/no-alcohol (72.4%), and coffee beverages (82.0%; all $p < 0.001$ vs water). “Sugar” and “fruit juice concentrate” were the most common sugars, while “sucralose” and “acesulfame K” were the most common NNS, with few cross-country differences.

Conclusion: Sweeteners, including NNS combinations, are prevalent in beverages worldwide. NNS use was greater among countries with mandatory sugar-based tax and/or front-of-package nutrition labelling policies.

O.2.21-1

The Development of an Accessible Evaluation Method from a Systems Perspective with Adolescents

M.J. ter Bogt^{1,2}, T. Altenburg^{1,2}, M.J. Chinapaw^{1,2}

¹Amsterdam UMC location Vrije Universiteit, Public and Occupational Health, Amsterdam, Netherlands, ²Amsterdam Public Health, Health Behaviors and Chronic Diseases, Amsterdam, Netherlands

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Most adolescents fail to meet the recommended daily physical activity guidelines, while interventions aimed at promoting adolescents' physical activity levels remain to have limited effect. Potential explanations include limited involvement of adolescents during intervention development and evaluation, and limited acknowledgement of physical activity being complex and context dependent. Therefore, complexity-sensitive evaluation is necessary to understand what effects actions achieve, why, how and for whom. Existing evaluation methods are however not accessible to adolescents. Therefore, we aim to present the development and evaluation of an accessible, meaningful and inclusive participatory evaluation protocol that builds on the realist-informed ripple effects mapping protocol.

Methods: The protocol was developed in an iterative and participatory process across six cases in Europe and Africa that aim to evaluate systemic actions designed in co-creation with adolescents. First, an overview of the protocol prerequisites was determined based on scientific literature about realist-informed ripple effects mapping; and in collaboration with experts, researchers and facilitators of participatory processes with adolescents. Second, the protocol was developed step-by-step through continuously reflecting and adapting from both a methodological and participatory perspective. Third, the protocol was pre-tested and further developed with adolescents at schools; and a training program was developed in which facilitators from all cases participated. Fourth, facilitators in various cases applied the protocol. Observation forms, focus groups and questionnaires will be thematically analyzed to evaluate the protocol.

Results: The protocol consists of one discovery meeting and three workshops to map the action effects and the pathways to achieve those. It was mainly applied to evaluate physical activity actions in five countries (Nigeria, South Africa, the Netherlands, Denmark, Portugal) with adolescents. To illustrate our process to translate complex evaluation methods to accessible evaluation methods for adolescents, we provide an overview of the crucial iterations per step, and insights into the protocol evaluation.

Conclusion: The process to translate complexity-sensitive evaluation methods toward accessible, meaningful evaluation methods for adolescents requires scientific rigor (e.g., building on literature, in consultation with methodological experts) and meaningful participation (e.g., co-creation). We reflect on how acknowledging and integrating both may strengthen one another.

O.2.21-2

Culinary Nutrition Needs and Challenges in Individuals with Intellectual Disabilities and their Caregivers in Switzerland

S. Schmocker¹, K. Uhlmann¹, J. Haddad¹, F. Pfister¹

¹Bern University of Applied Sciences, Bern, Switzerland

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Individuals with intellectual disabilities (ID) experience greater health inequalities than the general population. While independent living supports well-being, it is also linked to increased sedentary time and unhealthy dietary habits. Promoting healthy, independent living is therefore essential. Culinary nutrition programs can improve nutritional knowledge, behavior, self-determination, and social participation. However, no structured, evidence-based programs exist for individuals with ID in Switzerland, and the motivational factors, needs, and challenges informing such programs remain largely unexplored. This study examined these factors among individuals with ID and their caregivers.

Methods: A qualitative descriptive design was used. Four organizations supporting independent living in German-speaking Switzerland were recruited via convenience sampling. A focus group interview guide was developed from the

ORAL ABSTRACT SESSIONS

Cook-Ed™ model and pre-tested. In June and July 2025, eight focus groups were conducted, one with adults with mild to moderate ID and one with caregivers in each organization. Each group included 3-7 participants. Discussions were audio-recorded, transcribed verbatim, and analyzed using qualitative content analysis following Mayring's approach. Triangulation was achieved by comparing perspectives across the two groups.

Results: Four themes, nine codes, and 35 subcodes emerged. Participants showed strong interest in cooking and nutrition and preferred practical, easy-to-understand materials, such as recipes with numbered pictures or simple instructional videos. They described challenges related to limited time and financial resources, difficulties using digital formats, and modifying recipes. Participants emphasized the need for materials and tools that can be tailored to individuals with varying levels of disability. Reported motivation was linked to learning to cook a variety of dishes and participating in menu planning. Caregivers highlighted the importance of supporting residents' independence while providing consistent guidance.

Conclusion: The insights gained will now inform the design of a structured culinary nutrition program that is accessible, adaptable, and aligned with the lived realities of individuals with ID and their caregivers. As part of the participatory EssEntial project, this next phase involves co-creating and piloting program modules, followed by evaluation of their impact on nutritional behavior and autonomy. This process aims to establish a replicable model for inclusive, practical nutrition education in Swiss care institutions.

O.2.21-3

Barriers and Facilitators to Older Adults' Engagement in a Mall-walking Program: A Qualitative Citizen-science Study

M. Kritz^{1,2}, C. Thøgersen-Ntoumani^{3,4}, W. Hyll¹, B. Barkataki², N. Ntoumanis^{3,4}

¹University of Continuing Education Krems, Department for Economy and Health, Krems, Austria, ²Curtin University, Curtin School of Allied Health, Perth, Australia, ³University of Southern Denmark, Danish Centre for Motivation and Behaviour Science, Odense, Denmark, ⁴University of Birmingham, School of Sport, Exercise, and Rehabilitation Sciences, Birmingham, Australia

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Physical activity (PA) is essential for maintaining health, mobility, and psychological well-being in later life, yet participation among older adults remains low, especially among those with health, functional, or social disadvantages. Mall-walking, structured walking in indoor shopping centres, offers a safe, accessible, and weather-independent opportunity for PA and social connection. It holds promise as a feasible and sustainable strategy for active ageing, particularly as climate change makes outdoor walking more challenging. Although implemented in some countries, such programs remain understudied and are largely unknown in European contexts. As part of a broader citizen-science initiative, this qualitative study aims to address this gap by exploring psychological, contextual, and motivational factors facilitating or hindering older adults' engagement in mall-walking, to guide development of a peer-led mall-walking program in Austria.

Methods: Using purposive sampling across community and aged-care settings, approximately 40 semi-structured interviews and focus groups are conducted with older adults, caregivers, and professionals working with older adults in Austria. Sessions are audio-recorded and transcribed verbatim, with data collection expected to be completed by early 2026. Guided by the COM-B model (Capability, Opportunity, Motivation–Behaviour) and analysed inductively using reflexive thematic analysis, the study integrates participatory feedback loops in which citizen scientists review and refine emerging themes prior to the co-design of the intervention. This iterative, collaborative approach ensures that findings remain grounded in the lived experiences and needs of older adults.

Results: Findings will be mapped to the COM-B model, enabling a behavioural diagnosis that informs intervention design. Key thematic domains are expected to capture motivational dynamics, perceived accessibility, social aspects, and contextual enablers and barriers to participation.

Conclusion: The study is expected to provide novel insights into the psychological, contextual, and motivational factors underlying older adults' engagement in mall-walking. These insights will inform the subsequent co-design and development of a peer-led mall-walking program in Austria. Beyond its local relevance, the study may offer guidance for developing inclusive, scalable, and sustainable mall-walking programs and other community-based physical activity initiatives that promote active ageing and social connectedness through participatory, community-driven approaches.

O.2.21-4

Co-creating the Big Food Map App: A Participatory Approach to Understanding Food Environments in Flanders

J. Benhaïem¹, S. D'Hooghe^{1,2}, J. Van Kerckhove^{1,3}, S. Vandevijvere¹

¹Sciensano, Epidemiology, Brussels, Belgium, ²Vrije Universiteit Brussel, Brussels, Belgium, ³Ghent University, Primary Care and Public Health, Ghent, Belgium

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: This study describes the participatory development of the Big Food Map app, a large-scale citizen-science tool designed to capture perceptions of the local food environment across Flanders, Belgium. The objective was to co-create an inclusive and practical platform that engages citizens in reflecting on their food environments, raises awareness of environmental influences on diet, and supports action toward healthier and more sustainable food systems.

Methods: The app was co-created with citizens—particularly adolescents and adults on lower incomes—and with local governments, retailers, and short-chain initiatives. Co-creation involved Photovoice workshops to document lived food-environment experiences and Group Model Building sessions with stakeholders to identify key food-environment dimensions and settings. Citizens and actors jointly refined the app's design, question formats, and feedback functions. The app was launched between May and August 2025 to crowdsource data on perceptions and behaviours related to neighbourhood food environments. Descriptive analyses were used to summarise participation patterns, and brief evaluation questionnaires captured perceived usefulness and potential behavioural impact.

Results: A total of 4 707 citizens from 1 320 neighbourhoods (48 % of all in Flanders) evaluated 11 313 food outlets. Participants appreciated visualising and discussing their local food environments; about half liked the app's design, 24 % reported greater awareness of their food surroundings, and 56 % indicated willingness to participate again. Both citizens and stakeholders valued the collaborative process but noted challenges around sustained engagement, technical usability, and inclusion of vulnerable groups. The process strengthened partnerships between research, policy, and practice.

Conclusion: The Big Food Map demonstrates the feasibility of co-creating digital citizen-science tools that integrate public perspectives into food-environment research and policy. Beyond data collection, participatory design enhanced awareness and collaboration among citizens and stakeholders. Future work will focus on sustaining engagement, broadening inclusion, and embedding such tools within municipal food-policy frameworks.

O.2.21-5

Physical Exercise Modalities and Glycaemic Control in People with Prediabetes: GLYCEX Randomised Trial

¹University of the Balearic Islands, Department of Pedagogy and Specific Didactics, Palma, Spain, ²University of the Balearic Islands, Department of Nursing, Palma, Spain

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Type 2 diabetes mellitus (T2DM) is a chronic disease with a high prevalence worldwide and multiple associated comorbidities. It is characterised by elevated glucose levels due to a decrease in insulin sensitivity and pancreatic beta-cell dysfunction. Prediabetes represents an intermediate state preceding the development of T2DM, defined by glucose concentrations above the normal range but below the diagnostic threshold for T2DM (fasting plasma glucose (FPG) between 100–125 mg/dL). At this stage, lifestyle interventions have the potential to reverse the condition and restore normoglycaemia. The beneficial role of exercise on glycaemic control is well established; however, further evidence is needed to determine which specific exercise modalities are most effective for improving glucose regulation in individuals with prediabetes. This study aimed to evaluate the effectiveness of different modalities of physical exercise on glycaemic control in adults with prediabetes, using continuous glucose monitoring (CGM).

ORAL ABSTRACT SESSIONS

Methods: A controlled, parallel, randomised clinical trial with four groups: aerobic training (AT), resistance training combined with aerobic training (RT+AT), high-intensity interval training (HIIT), and a control group. Inclusion criteria were age between 18 and 70 years, FPG 100-125 mg/dL, body mass index between 25-35 kg/m², and not engaging in regular physical exercise. Exclusion criteria were a diagnosis of T2DM, pregnancy, and medical conditions preventing safe exercise. Sociodemographic data, comorbidities, CGM, blood tests and blood pressure were collected at baseline and at 15 weeks of follow-up.

Results: Of 407 individuals screened, 106 were randomised and 91 completed the trial (AT: n=23; RT+AT: n=24; HIIT: n=19; control: n=25). Overall, 50.6% of participants were women. Compared with control, HIIT significantly increased time in range <140mg/dL ($\beta=9.86$; 95% CI: 0.89 to 18.82; $p=0.031$) and reduced FPG ($\beta=-7.77$; 95% CI: -13.01 to -2.52; $p=0.004$) and HbA1c ($\beta=-0.230$; 95% CI: -0.335 to -0.125; $p<0.001$); RT+AT also significantly reduced HbA1c ($\beta=-0.113$; 95% CI: -0.213 to -0.013; $p=0.027$). Finally, AT showed limited effects on glycaemic control, improving HDL-c and triglycerides.

Conclusion: In a population with prediabetes, overweight or obesity and sedentary lifestyles, HIIT, primarily, and to a lesser extent RT+AT, improved glycaemic control. Both exercise modalities could become effective strategies to prevent T2DM.

O.2.21-6

Evolving Experiences of Food Pantry Clients: Three Years of Neighbor Satisfaction Data

H. Muzaffar¹, G. Campbell¹, K. Brasseur²

¹Northern Illinois University, School of Health Studies, DeKalb, United States, ²Northern Illinois Food Bank, Geneva, Illinois, United States

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Food insecurity remains a major public health concern, particularly among rural and low-income households. Charitable food programs play a critical role in addressing hunger, yet limited research has examined client satisfaction and access over time. This study examined changes in neighbor satisfaction, food choice, perceived accessibility, and barriers to food assistance across three years utilizing Northern Illinois Food Bank (NIFB) Neighbor Satisfaction Survey.

Methods: A cross-sectional, mixed-methods study was conducted using three annual survey waves (2022–2024). Surveys were completed by 6,251 individuals across 13 counties in Northern Illinois served by NIFB. Sites included food pantries, mobile markets, and online ordering and delivery programs. Primary outcomes included accessibility to free food, perceived food quality and choice, satisfaction with staff interactions, and likelihood of recommending NIFB services. Descriptive statistics summarized quantitative data. Qualitative responses were analyzed thematically. Independent-samples t tests and one-way ANOVA compared results across survey years.

Results: Across all years, most neighbors reported accessing food assistance was not difficult, though a consistent minority experienced notable barriers. A t-test confirmed a statistically significant improvement from 2022 to 2024 ($p < 0.001$, $d = 0.95$), indicating a large practical effect. Neighbors also consistently prioritized autonomy, convenience, and dignity in their food program experiences. Perceived alignment between pantry offerings and foods neighbors would choose at a store improved over time, increasing from 50% in 2022 to 66% in 2024. Neighbor willingness to recommend services remained high throughout the three-year period. Mean recommendation scores increased from 8.7 in 2022 to 9.2 in 2023 and remained high at 9.1 in 2024. Net Promoter Scores (NPS) followed a similar pattern, rising from 55% in 2022 to 77% in 2023 and stabilizing at 70% in 2024. ANOVA results confirmed statistically significant variation across years ($p \leq 0.007$; $\eta^2 = 0.02$). Qualitative findings revealed three key themes: perceived food quality and variety, access and convenience (e.g., limited hours, online ordering), and unwelcoming atmosphere.

Conclusion: Findings demonstrate progress in satisfaction and accessibility within charitable food programs. Enhancing language assistance, staff training, and client-choice models may further improve dignity and equity in food distribution. Ongoing evaluation is needed to address persistent barriers.

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: To develop age- and sex-specific reference values for handgrip strength in Swedish preschool children and to examine the associations of device-measured movement behaviours: sedentary time (ST), light physical activity (LPA), moderate-to-vigorous physical activity (MVPA), and sleep duration, with handgrip strength using compositional data analysis.

Methods: This cross-sectional population-based study included 3,218 preschool children (48.5% girls) aged 3.0–5.9 years recruited from 124 public preschools in the Stockholm region between September 2020 and February 2021. Handgrip strength was measured with a validated analog dynamometer (TKK 5825, Takei, Tokyo, Japan). In a subsample of 2,328 preschool children wore a triaxial accelerometer (ActiGraph GT3X+) during 24-hours over seven consecutive days. Time-use data were classified into ST, LPA, MVPA, and sleep according to validated cut-points for preschoolers. Smoothed age- and sex-specific percentiles for handgrip strength were derived using the LMS method. Associations between handgrip strength and the 24-hour movement composition were examined using compositional data analysis, with analyses stratified by sex and adjusted for age, body mass index, and parental education.

Results: Handgrip strength and all age- and sex-specific percentiles increased steadily with age, with median values rising from 4.08 to 7.42 kg in boys and from 3.45 to 6.87 kg in girls, and values at the 95th percentile approaching 9.5 kg by age 5. In compositional models, MVPA was positively associated with handgrip strength ($\beta = 1.22$ kg; 95% CI 0.81–1.62), whereas ST was inversely associated ($\beta = -0.84$ kg; 95% CI -1.31, -0.36). No significant associations were observed for LPA ($\beta = -0.48$ kg; 95% CI -1.23, 0.27) or sleep duration ($\beta = 0.10$ kg; 95% CI -0.37, 0.57). Sex-stratified analyses showed similar patterns, and interaction terms were not significant.

Conclusion: This study provides the first normative handgrip strength reference values for preschool children in Northern Europe and demonstrates that MVPA is a key behaviour positively associated with muscular strength, whereas ST is negatively associated. These findings offer a valuable screening tool for identifying preschool children with low muscular strength and highlight the importance of promoting active lifestyles and reducing sedentary behaviour from the earliest years of life.

ORAL ABSTRACT SESSIONS

O.2.21 Participatory Research in Health Promotion: Health for All: Tailoring Interventions for Diverse Populations and Vulnerable Groups

Room 9, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Promoting movement behaviours and wellbeing among adolescents is essential for addressing non-communicable diseases and reducing health inequities. The Youth-centred Participatory Action (YoPA) project (<https://www.yopa-project.eu/>) aims to co-design and implement context-specific interventions through participatory action research across diverse socio-cultural contexts in European and African sites. This study presents a realist-inspired process evaluation of YoPA Phase 1, focusing on the establishment of local YoPA communities. It examines barriers and facilitators during early implementation and explores cross-site similarities and differences in initiating co-creation processes within distinct socio-cultural and institutional contexts.

Methods: Semi-structured interviews (average length: 43min27s) were conducted with 22 adult participants, including consortium members and institutional stakeholders (14 female). Additional data sources included facilitator logbooks (n=61). A deductive thematic analysis was performed on MAXQDA24 using the novel co-creation PROSECO framework to identify the main barriers and facilitators. Findings were subsequently interpreted through a Context-Mechanism-Outcome (CMO) lens to explore how contextual conditions influenced early implementation processes and outcomes.

Results: Across the five PROSECO dimensions, Group Dynamics (n=77) and Partnership (n=74) emerged as key facilitators, alongside Resources and support (n=50). Main barriers mirrored these domains, with Group Dynamics (n=76), Contextual Influences (n=74), and Feasibility (n=42) being predominant. Delivery-related elements were less frequently reported at this phase.

The CMO analysis showed that supportive contexts, such as existing collaborative networks and available infrastructure, potentially triggered mechanisms of preparedness and confidence, leading to smoother early implementation and stronger adherence to plans. Power imbalances and lack of trust within groups reduced participation and produced uneven co-creation dynamics, probably activated by mechanisms of discomfort. Cross-site comparisons indicated that cultural norms around hierarchy and communication shaped these mechanisms differently across contexts.

Conclusion: Early implementation of a youth-centred participatory approach was shaped by contextual enablers, social mechanisms, and partnerships. Relational trust, facilitation, and capacity building were key to sustained engagement and meaningful youth participation. The realist-informed PROSECO analysis provided comparative insights into culturally diverse settings. These findings can contribute to advancing participatory health promotion approaches and inform future efforts to design contextually grounded, equitable interventions for adolescent wellbeing and movement behaviour.

O.2.22-1

Cost-effectiveness of 24-hour Movement Behavior Interventions for Secondary Prevention in Patients with Cardiovascular Disease: A Systematic Review

S. Broers^{1,2}, R. Collet³, J.M. van Dongen³, J.M. Visser-Meily^{1,4}, Y.A. Hartman^{1,2,5}, M.F. Pisters^{1,2,5}

O.2.22 Mental Health and Wellbeing: Mental Health, Nutrition, and Movement: Integrative Approaches to Well-being Multipurpose Room, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Cardiovascular disease (CVD) affects 620 million people worldwide, a number projected to reach 1.1 billion by 2050. Consequently, demand for rehabilitation and chronic care will rise, increasing healthcare costs. These trends highlight the need for preventive strategies to ensure sustainable and accessible healthcare. Secondary prevention through modifiable risk factors, such as 24-hour movement behavior (24h-MB; physical activity, sedentary behavior, sleep), plays an important role. Although the clinical benefits of balanced 24h-MB profiles are known, evidence on the cost-effectiveness of 24h-MB interventions remains unclear. This systematic review aims to identify, appraise, and synthesize existing evidence on the cost-effectiveness of 24h-MB interventions in CVD patients.

Methods: A systematic search was conducted in four databases (Embase, PubMed, CENTRAL, CINAHL). Eligible

ORAL ABSTRACT SESSIONS

studies were full economic evaluations from developed countries adopting a healthcare and/or societal perspective, included adults with CVD, and focused $\geq 50\%$ of intervention content on improving 24h-MB or one of its components. Comparators were usual care or no intervention. Two reviewers independently screened studies using ASReview and Rayyan. Quality was assessed with CHEERS, ROB-2, and ECOBIAS. Costs were standardized to 2024 Euros. The primary outcome was incremental net monetary benefit (INMB). Where feasible, meta-analyses were performed by perspective and follow-up, with cost-effectiveness acceptability curves generated across willingness-to-pay thresholds.

Results: Eighteen studies (including a total of 13,987 participants) met inclusion criteria; two used a societal perspective. None targeted all 24h-MB activities: seventeen focused on physical activity, one on sleep, none on sedentary behavior. Reporting quality was good in seven studies and moderate in others. Half showed high risk of bias, mainly due to missing data. Meta-analysis (healthcare perspective, one-year follow-up) showed 24h-MB interventions were cost-effective versus control (INMB MD 2.706; 95% CI 849–4.563; $I^2 = 44.5\%$; 7 trials; $n = 1.199$). Results at 8 weeks, 6 months, and lifetime perspectives were consistent.

Conclusion: Preliminary findings* suggest that 24h-MB interventions may be cost-effective for CVD patients, offering both health benefits and cost savings. These results indicate opportunities for improved care at lower costs and support the integration of 24h-MB interventions into more efficient and sustainable healthcare systems.

*Preliminary results; final analysis December 2025.

O.2.22-3

Exposure to Appearance-focused vs. Body-positive Media Content: Associations with Intuitive and Disordered Eating in Adolescents

A.-F. Tessier^{1,2}, M. Plouffe^{1,2}, C. Fitzpatrick³, É. Carbonneau^{4,2}, F.-A. Guimond⁵, M.-P. Gagnon-Girouard^{1,2}, N. Carbonneau^{1,2}

O.2.22 Mental Health and Wellbeing: Mental Health, Nutrition, and Movement: Integrative Approaches to Well-being Multipurpose Room, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: The association between screen use and eating patterns among adolescents has received considerable attention. However, most studies on this topic provide little detail about how exposure to body image-related media content is linked to eating behaviors. To address this gap, the present study examined the extent to which exposure to appearance-focused media content and exposure to body-positive media content are associated with various eating behaviors: intuitive eating (i.e., eating in response to internal hunger and satiety cues), dieting (i.e., deliberate restriction of food intake to influence body weight or shape), bulimia and food preoccupation (i.e., recurrent thoughts about food and episodes of overeating) and oral control (i.e., efforts to strictly monitor food intake) in adolescents, while controlling for age, sex, and weekly time spent engaging in different screen-based activities (e.g., social media, video gaming).

Methods: This study includes preliminary data from the first measurement time point of a one-year longitudinal study. Participants were 236 adolescents (51% girls, 49% boys), aged 12 to 17 years, recruited from various high schools in Quebec, Canada. Measures included exposure to body image-related media content (*Body Positive Media Scale*), weekly time spent on different screen-based activities (*ABCD Youth Screen Time Survey*), problematic eating behaviors (*Eating Attitudes Test-26*) and intuitive eating (*Intuitive Eating Scale-3*).

Results: The results show that, when controlling for age, sex, and weekly time spent engaging in various screen-based activities, exposure to appearance-focused media content was positively related to dieting ($\beta = .33, p < .001$), bulimia and food preoccupation ($\beta = .24, p < .01$), and oral control ($\beta = .19, p < .05$), and negatively related to intuitive eating ($\beta = -.28, p < .001$). Conversely, exposure to body-positive media content was not significantly related to any of the eating behaviors (all $ps > .05$).

Conclusion: The results of this study highlight that exposure to appearance-focused media content—but not to body-positive media content—is associated with maladaptive eating patterns, even after controlling for overall screen time. These findings underscore the importance of considering the nature of media content adolescents are exposed to when examining the associations between screen use and eating patterns.

O.2.22 Mental Health and Wellbeing: Mental Health, Nutrition, and Movement: Integrative Approaches to Well-being Multipurpose Room, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Evidence links overall dietary patterns to mental health, but studies on specific food groups and nutrients aligned with dietary guidelines are needed to inform population-level mental health preventive strategies. Within the Global burden of disease Lifestyle And mental Disorder (GLAD) Taskforce, we aimed to determine the associations between dietary exposures and elevated depressive symptoms, including potential sex-specific differences, in the French NutriNet-Santé cohort.

Methods: Prospective observational study using NutriNet-Santé cohort data (2011-2022). Dietary intake was assessed at baseline and every six months for two years using non-consecutive 24-hour records, defining the “dietary exposure window”. Exposures included food groups (fruits, vegetables, legumes, whole grains, nuts & seeds, milk, red meat, processed meat, and sweet drinks) and nutrients (fibre, calcium, omega 3, polyunsaturated fatty acids (PUFA), and sodium) as defined by the Global Burden of Disease (GBD), as well as ultra-processed foods (UPFs) using the NOVA classification. Participants with self-reported depression at baseline or during the dietary exposure window were excluded. The Center for Epidemiologic Studies Depression (CES-D) scale was administered every two years, using validated French cutoffs (≥ 17 for men, ≥ 23 for women) to indicate elevated depressive symptoms. Associations were estimated using multivariable Generalized Estimating Equations (GEE) adjusting for confounders.

Results: Among 40,658 adults (75.7% women; mean age 46.6 years), 8,739 (21.5%) met criteria for elevated depressive symptoms at least once during a median follow-up of 8.36 years. Overall, higher intakes of fruits ($OR_{100g/d \text{ increase}} = 0.968$; 95%CI=0.948-0.989), vegetables ($OR_{100g/d} = 0.918$; 95%CI=0.890-0.946) and fibre ($OR_{10g/d} = 0.954$; 95%CI=0.930-0.980) were associated with lower odds of developing elevated depressive symptoms, while higher intake of red meat ($OR_{10g/d} = 1.009$; 95%CI=1.001-1.017), sweet drinks ($OR_{100g/d} = 1.046$; 95%CI=1.016-1.076), and the dietary share of UPFs ($OR_{10\%g} = 1.160$; 95%CI=1.126-1.196) were associated with increased odds. Most associations remained only among women, in whom processed meat emerged as positively associated ($OR_{10g/d} = 1.014$; 95% CI: 1.001–1.028).

Conclusion: Fruits, vegetables, and fibre were associated with reduced odds of elevated depressive symptoms, while red meat, processed meat, sweet drinks, and UPFs were associated with increased odds. These results align with official nutritional guidelines in France and in many countries, supporting their promotion to improve population-level mental health.

O.2.22-5

Evaluating the Thriving Communities Lab: A Systems-based Approach to Promote Youth Well-being in a Danish Municipality

K. Ryom¹, N. Daugaard¹, C.B. Simonsen¹, H.T. Maindal¹

¹Aarhus University, Department of Public Health, Aarhus, Denmark

O.2.22 Mental Health and Wellbeing: Mental Health, Nutrition, and Movement: Integrative Approaches to Well-being Multipurpose Room, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: The Thriving Communities Lab (2025-2029) aims to strengthen youth well-being (ages 12–25 years) through systemic and cross-sector collaboration in the Danish municipality of Faaborg-Midtfyn, based on a Collective Impact design. The overall evaluation seeks to understand how system-level change unfolds over time, notably which mechanisms, processes, and contextual factors enable, sustain, or constrain systemic capacity-building for youth well-being. The study contributes to the growing field of complex systems evaluation by applying an innovative, multi-level approach integrating theory-driven and participatory methods.

ORAL ABSTRACT SESSIONS

Methods: The evaluation employs a multi-method design encompassing seven interlinked sub-studies. These explore: (1) municipal capacity and readiness for systemic change; (2) identification of leverage points via causal loop diagram analysis, eco-system mapping and youth input; (3) ownership and partnership formation; (4) the application of the Collective Impact design; (5) data use throughout the study; (6) tracking of system changes; and (7) synthesis and refinement of the programme theory. Data methods include focus groups, semi-structured interviews, surveys, ethnographic observations, and participatory mapping (e.g. Ripple Effects Mapping and Action Registry). Analytical frameworks draw on realist evaluation and systems theory.

Results: As a formative, longitudinal design, early results of the evaluation study will document the processes through which municipal actors develop systemic capacity, share data, and coordinate collaboration across sectors. By integrating dynamic tracking tools (e.g., IMPAcT process), the evaluation captures evolving patterns of collaboration, feedback loops, and emergent leverage points within the system. Cross-cutting synthesis will refine the initial Theory of Change and elucidate the mechanisms by which systemic interventions influence youth well-being outcomes. We will present the overall evaluation design and baseline data from sub-study 2 at the conference.

Conclusion: This evaluation represents an innovative contribution to public health systems research by operationalizing complex systems thinking in a municipal context. Through its integrative and participatory design, the Thriving Communities Lab will produce evidence on how cross-sector collaboration, data use, and Collective Impact approaches potentially can foster sustainable system change to improve youth well-being and guide future policy and practice.

O.2.22-6

Stress and Physical Activity in People with Epilepsy: An Ecological Momentary Assessment Study

J. Delobelle^{1,2}, E. Carrette³, J. Van Cauwenberg⁴, K. Vonck³, B. Chaix⁵, D. Van Dyck¹

¹Ghent University, Department of Movement and Sports Sciences, Ghent, Belgium, ²Research Foundation Flanders, Brussels, Belgium, ³Ghent University, Department of Head and Skin, Ghent, Belgium, ⁴Université Libre de Bruxelles, School of Public Health, Brussels, Belgium, ⁵Sorbonne Université, Institut Pierre Louis d'Épidémiologie, Paris, France

O.2.22 Mental Health and Wellbeing: Mental Health, Nutrition, and Movement: Integrative Approaches to Well-being Multipurpose Room, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Only about 35% of people with epilepsy (PWE) meet the recommended physical activity (PA) guidelines, despite the known antiepileptic and stress-reducing benefits of PA. At the same time, stress is one of the most frequently reported seizure triggers, and may also limit engagement in PA. Understanding how stress and seizures interact with daily PA is therefore highly relevant for PWE. Existing research on seizures, stress and PA is limited to retrospective and cross-sectional studies, which cannot capture daily fluctuations or support causal conclusions. To address these gaps, this study used a 30-day longitudinal ecological momentary assessment (EMA) design. Objectives were twofold: (1) examine how epileptic seizures influence PA and (2) investigate how stress affects PA.

Methods: Thirty adults with refractory epilepsy (mean age: 39.7 years, SD = 12.1; 52.6% male) participated in the study. Daily moderate-to-vigorous physical activity (MVPA) was objectively measured using an ActiGraph accelerometer. Heart rate variability (HRV) was assessed twice daily via the Polar H10 chest strap as an objective marker of stress. Participants completed a time-based EMA survey twice daily via the Eco Emo Tracker smartphone app, which captured self-reported stress and potential confounders (identified using a directed acyclic graph, DAG). Results were analyzed using mixed-effects models.

Results: High within-subject variability was observed in MVPA (82%) and HRV (74%), reflecting substantial day-to-day fluctuations. Preliminary analyses (N = 18) indicated a trend toward higher MVPA the day after a seizure (+11.1%, 95% CI [0.3%; 21.4%], $p = .05$). No significant associations were observed between morning HRV or self-reported stress and subsequent MVPA that day. Final results will be presented at the conference.

Conclusion: High within-subject variability in MVPA and HRV underscores the pronounced day-to-day fluctuations in PA and physiological stress among PWE. Increased MVPA following seizures may reflect compensatory or adaptive coping behavior to regain control or well-being after seizure events. The absence of associations between MVPA, HRV, and stress suggests that daily fluctuations in physiological and perceived stress do not directly translate into changes in PA, or that they influence PA through distinct pathways. These preliminary findings emphasize the need for further research on within-person dynamics in larger samples.

O.2.22-7

Digital Phenotyping Using Wearable-determined Physical Behaviors and Machine Learning to Detect Depression and Anxiety Symptoms in a General Population

A. Sameh¹, L. Nauha¹, M. Seppänen², M. Niemelä¹, M. Oussalah³, R. Korpelainen⁴, V. Farrahi⁵

¹University of Oulu, Health Sciences and Technology (HST), Oulu, Finland, ²University of Oulu, Department of Sports and Exercise Medicine, Oulu, Finland, ³University of Oulu, Faculty of Information Technology and Electrical Engineering, Oulu, Finland, ⁴ODL, Oulu Deaconess Institute Foundation sr., Oulu, Finland, ⁵TU Dortmund University, Institute for Sports and Sport Sciences, Dortmund, Germany

O.2.22 Mental Health and Wellbeing: Mental Health, Nutrition, and Movement: Integrative Approaches to Well-being Multipurpose Room, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Depression and anxiety are common mental health disorders, but diagnosing them remains challenging. Digital phenotyping using wearable devices data offers a promising approach for detecting depression and anxiety in the general population. This study aims to explore the extent to which wearable accelerometer-determined physical behavior metrics can be used as digital phenotypes for identifying individuals with and without depression or anxiety symptoms using machine learning (ML) algorithms.

Methods: At age 46, participants (N = 2,810) from the Northern Finland Birth Cohort 1966 carried wrist- and waist-worn accelerometers for 14 consecutive days. Physical activity and sedentary behaviors were measured using data from the waist-worn device, while sleep behavior was identified based on data from the wrist-worn accelerometer. A total of 54 physical behavior metrics were extracted for each participant. The severity of depression and anxiety symptoms was assessed using three validated instruments: the Beck Depression Inventory-II, Generalized Anxiety Disorder-7, and the Hopkins Symptom Checklist-25. Five ML algorithms were applied to identify individuals with and without depression and anxiety symptoms. Model interpretability was enhanced using SHapley Additive exPlanations (SHAP) to assess the contribution of individual features.

Results: Among ML models, random forest achieved the best performance, with accuracy from 66% to 72% and AUC values between 66% to 70% across all three instruments. Physical behavior metrics extracted from accelerometers emerged as potential predictors of depression and anxiety. In the SHAP analysis, wake-up time, time in bed, bed time, physical activity intensity proportions, and prolonged sedentary bouts were identified as the most important features.

Conclusion: Wearable-derived metrics of physical behaviors, combined with ML models, can be utilized with reasonably good accuracy to distinguish between participants with and without depression or anxiety symptoms. Our findings support the utility of wearable-derived digital phenotypes of physical behavior for differentiating between participants with and without depression or anxiety symptoms in a general population.

O.2.22-8

Intermittent-vigorous Intensity Physical Activity as a Strategy for Recovery in Severe Mental Illness

M. Caro-Crous^{1,2}, A.M. Puig Ribera¹, J.M. Santos López^{1,3,2}

¹Universitat de Vic - Universitat Central de Catalunya, Vic, Spain, ²Centre Mèdic Psico-pedagògic d'Osona, Osonament, Vic, Spain, ³Hospital Universitari de Vic, Vic, Spain

O.2.22 Mental Health and Wellbeing: Mental Health, Nutrition, and Movement: Integrative Approaches to Well-being Multipurpose Room, May 29, 2026, 12:00 PM - 1:00 PM

Purpose: Due to some people with severe mental illness showing resistance to usual treatment, making their clinical recuperation difficult, non-pharmacological interventions can be a good strategy. This study aimed to evaluate the efficacy of a 28-week intermittent-vigorous intensity program, combining High Intensity Interval Training (HIIT) and Vigorous Intermittent Lifestyle Physical Activity (VILPA), on clinical outcomes compared to a control group who received usual treatment.

Methods: It is a pragmatic clinical trial involving two mental health services located in different geographic areas (Manresa and Vic, Catalonia). All eligible consenting participants from one center (n=34) were allocated to the

ORAL ABSTRACT SESSIONS

intervention group (IG) and those from the other center (n=23) to the control group (CG). IG took part in a three-stage physical activity intervention. In stage one (weeks 1-8), they participated in two HIIT sessions per week. In the second stage (weeks 9-16), they were involved in one HIIT session per week and asked to start doing VILPA during the day. In stage three (weeks 17-28), participants had to accumulate as much VILPA as they could throughout the day. Data were collected at baseline and at 16 and 28 weeks, including depression symptomatology (HAM-D) and positive and negative psychotic symptomatology (BPRS-S). We used a Per-Protocol approach to evaluate changes over time and between groups.

Results: Compared to baseline, after 16 weeks (HIIT and HIIT+VILPA intervention), the IG significantly improved their depression (14.24 to 11.76 points; $p=0.013$) and positive (4.23 to 2.00 points; $p=0.006$) and negative (2.31 to 1.38 points; $p=0.046$) psychotic symptomatology, compared to the control group, who did not improve in it. During the following 12 weeks (VILPA intervention), the intervention group maintained the improvements achieved before. More importantly, compared to baseline and after 28 weeks (overall intervention), IG significantly improved the depression (14.24 to 12.35 points; $p=0.025$) and positive (4.23 to 2.23 points; $p=0.012$) and negative (2.31 to 0.85 points; $p=0.007$) psychotic symptomatology. Meanwhile, CG did not significantly improve in anyone.

Conclusion: Adults with severe mental illness can significantly improve the clinical outcomes compared to a control group, who only follow a usual health treatment, when participating in this intermittent-vigorous intensity physical activity program.

ORAL ABSTRACT SESSIONS

SHORT ORALS

SO.1.01-02

A Grade-level Longitudinal Analysis of School and Community Food Environment Impact on Child Weight Status

A. Altares¹, S. Martinelli¹, B. Ronan¹, P. Ohri-Vachaspati¹

¹Arizona State University, College of Health Solutions, Phoenix, United States

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Previous research has indicated that child obesity status is influenced by the school and community food environment, with higher obesity rates observed in areas with greater access to unhealthy foods. Leveraging multiple years of measured student data, this study offers new insights into age-specific vulnerabilities by examining whether the impact of the food environment on child weight status differs by grade level.

Methods: At four time points from school year 2013 to 2019, trained school nurses collected height and weight data from K–12 students (n=76,182) across four low-income New Jersey school districts. Obesity prevalence, the primary outcome, was calculated from these measurements. The school food environment (school lunch and competitive foods) was assessed via surveys and characterized using summary scales. The community food environment (i.e. restaurants and stores) were identified as healthy or unhealthy, with the number of outlets within ¼ mile of each school calculated. Mixed-effects logistic regression models measured any association between food environment variables and obesity prevalence by grade level. Models were adjusted for child race and sex, measurement date, school-level sociodemographics, and clustering by school and school district.

Results: Patterns suggested that exposure to more unhealthy competitive foods corresponded with higher odds among those in grades 6–12. This pattern was significant in select grades; e.g., grade 6 students had higher odds of obesity when more unhealthy competitive foods were available (OR = 1.037, $p=0.000$). The associations for lower grades, K–5, were not significant. Similarly, a higher number of unhealthy community food outlets corresponded to higher odds of obesity prevalence for most grades; e.g., grade 10 (OR = 1.035, $p<0.030$). Conversely, a higher number of healthy community food outlets showed negative trends in obesity across several grades; e.g., grade 2 (OR = 0.934, $p = 0.003$). Associations for other grades not reported followed similar directions, though not all grades reached significance. Results will be visualized using forest plots to illustrate grade-specific trends.

Conclusion: These findings support evidence that a healthier food environment, characterized by greater access to nutritious options and fewer unhealthy options, may promote reductions in childhood obesity.

SO.1.01-03

Exploring Associations between Parenting Style, Stress, and Energy-dense Feeding Practices in Low-income Preschoolers: A Pilot EMA Study

M. Yuhas¹, K. Kidwell², L. Brann¹

¹Syracuse University, Nutrition, Syracuse, United States, ²Syracuse University, Psychology, Syracuse, United States

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Caregiver parenting style, stress and food-parenting practices (FPPs) shape young children's intake of energy-dense foods (EDF; ultra-processed snacks, sweets, and sugar-sweetened beverages), yet real-time evidence in low-income families is lacking. This exploratory pilot study examined (1) potential associations between baseline characteristics and EDF feeding episodes across one week and (2) whether caregivers' momentary stress during EDF episodes related to FPPs used.

Methods: A pilot sample of 20 caregivers of Head Start children (ages 3–5) completed baseline measures (parenting style, home availability, caregiver emotional eating, baseline stress, baseline FPPs) and 7 days of ecological momentary assessment (up to 7 prompts/day). At each prompt, if the child was present and EDF items were consumed, caregivers reported FPPs used and rated momentary stress (0–100). For Aim 1, we modeled caregiver-level counts of EDF episodes using Poisson regression (log link), robust SEs, and the log of eligible prompts as an offset (continuous predictors z-scored). For Aim 2, we tested momentary stress–practice associations during EDF episodes using GEE (logit link) with within-person stress (per +10 above a caregiver's mean) and between-person mean stress (z-scored).

Results: Authoritarian parenting was associated with a higher weekly probability of EDF episodes (RR = 1.43, 95% CI

SHORT ORALS

1.23–1.66, $p < .001$); authoritative trended lower ($RR = 0.90$, 0.80 – 1.01 , $p = .065$). Higher baseline stress was associated with more EDF episodes ($RR = 0.80$, 0.70 – 0.92 , $p = .001$). Momentarily, when caregivers felt more stressed than their own average, odds of offering food as a treat/reward increased ($OR = 1.08$ per +10 points, 1.02 – 1.15 , $p = .011$). Caregivers with higher average momentary stress were more likely to eat the same food alongside the child ($OR = 1.59$ per +1 SD, 1.02 – 2.48 , $p = .042$). Domain-level FPP composites (i.e., structure, autonomy, coercive, indulgent) showed no association with momentary stress.

Conclusion: In this pilot study, authoritarian style and higher stress showed preliminary associations with greater EDF episode likelihood, and momentary stress was associated with reward use during those episodes. If replicated in larger samples, these patterns may suggest potential targets for adaptive, just-in-time interventions. These findings should be considered hypothesis-generating and require confirmation in adequately powered studies.

SO.1.01-04

The Food Literacy BITE (Building Informed, Thoughtful, Empowered Eaters) Survey: Development and Measurement Properties in U.S. Elementary Schoolchildren

C. St. Pierre¹, J.B. Bingenheimer², R.M. van Dam¹, J.M. Satchek³

¹The George Washington University Milken Institute School of Public Health, Exercise and Nutrition Sciences, Washington, DC, United States, ²The George Washington University Milken Institute School of Public Health, Prevention and Community Health, Washington, DC, United States, ³Brown University School of Public Health, Behavioral and Social Sciences, Providence, United States

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions
Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Food education programs aim to support children in the early development of healthy food behaviors, and food literacy has been posited as a promising indicator of program influence on dietary habit formation. Existing tools for assessing children's food literacy, however, have primarily been developed from adult-centered conceptual models. The objective of this study was to develop a novel tool, the Food Literacy BITE survey, from four child-centered food literacy dimensions and evaluate its measurement properties among elementary schoolchildren (~9-12 years) in the U.S.

Methods: Items were developed for the four dimensions: food system and nutrition knowledge, confidence in everyday food skills, valuing shared food practices, and purposeful engagement with food. Item and scale-level content validity indices were calculated for two rounds of expert panel ratings. Group cognitive interviews ($n = 6$) were conducted with elementary students ($n = 43$) to assess comprehensibility in the target population. The survey was then tested with a socioeconomically and culturally diverse developmental sample of $n = 690$ elementary schoolchildren across 10 different schools, primarily in Washington, DC. Structural validity of the proposed model with four first-order factors and a second-order food literacy factor was tested with confirmatory factor analysis (CFA), and internal consistency was evaluated with composite reliability values.

Results: Expert review produced a 20-item survey with acceptable content validity, and cognitive interview findings informed revisions to improve comprehensibility. CFA supported the proposed model structure, with acceptable values across all model fit indices ($CFI = 0.96$, $TLI = 0.95$, $RMSEA = 0.046$, $SRMR = 0.051$) and all item loadings ≥ 0.45 . Two items were removed due to cross-loading. Internal consistency was acceptable for food literacy overall (0.74) and adequate for each of the individual dimensions (range: 0.62 – 0.71).

Conclusion: The 18-item Food Literacy BITE survey offers a tool for measuring food literacy in children, based on child-centered dimensions and validated among a diverse developmental sample. This survey can be particularly useful for tailored food education program planning and evaluation of program efficacy. Future research will focus on testing with rural and peri-urban populations and additional geographic regions to establish suitability for broader use.

A Quasi-experimental Comparative Effectiveness Study Evaluating the Feasibility and Effectiveness of a Produce Prescription Program in School-based Health Centers among Overweight and Obese Adolescents

R.-J. Chuang¹, J. Rowlands², K. Bess², M. Pomeroy³, L. Mottu⁴, A. Gaminian³, S. Ramirez⁴, M. Mathur², S. Sharma⁵

¹UTHealth Houston School of Public Health, Dept. of Health Promotion and Behavioral Sciences, Center for Health Equity, Houston, United States, ²UTHealth Houston School of Public Health, Center for Health Equity, Houston, United States, ³Brighter Bites, Houston, United States, ⁴Legacy Community Health, School-Based Health, Houston, United States, ⁵UTHealth Houston School of Public Health, Dept. of Epidemiology, Center for Health Equity, Houston, United States

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: School-based health centers (SBHC) are a critical solution to improve access to preventive services for children. While produce prescription programs have shown feasibility and impact in adults, data in adolescents receiving care at settings like SBHCs is lacking. This presentation is to share the design, framework, baseline data, and recruitment strategies of a USDA-funded GusNIP produce prescription pilot among under-resourced overweight/obese adolescents in four SBHCs in Galena Park, Texas.

Methods: The Brighter Bites/Legacy Produce Prescription Program is a multi-sectoral collaboration. Our partners include Brighter Bites (BB), a nonprofit providing fresh produce and nutrition education to families to improve child dietary outcomes, and Legacy Community Health (Legacy), the largest Federally Qualified Health Center and school-based health program in Texas. This study uses a quasi-experimental comparative study design (N=60) to assess the effectiveness of a home-delivery produce prescription program combined with evidence-based nutrition education. Participants receive ~20lbs of produce biweekly, coupled with five virtual culinary nutrition education sessions over 32 weeks. Eligible participants are Medicaid- or SNAP-eligible adolescent patients aged 10-17 who are overweight/obese. The control group is de-identified patients with a 1-to-1 match based on participants' demographics and insurance status from electronic health records. Recruitment was conducted in four SBHCs through health record screening, and patients were recruited in-person or by phone. Since January 2025, 52 participants have been enrolled, and the anticipated recruitment end date is November 30, 2025. Primary outcomes are BMI z-scores, blood pressure, hemoglobin A1c, liver and lipid panels. Secondary outcomes include household food insecurity, diet quality, and Patient Health Questionnaire for Adolescents score. Process evaluation includes program dosage, reach, acceptability, and feasibility.

Results: Among 52 currently enrolled participants, 63.5% were female, and 73.5% were Hispanic. At baseline, mean HbA1c was 5.5% (range: 5.1%–6.1%), with 56.3% obese and 43.8% overweight. Baseline lipid panel results showed mean total cholesterol levels at (155.78 mg/dL), HDL (53.93 mg/dL), LDL (83.54 mg/dL), and Triglycerides (122.11 mg/dL).

Conclusion: This pilot study will provide preliminary effect sizes for future trials and inform future strategies to promote the physical, behavioral, and mental health outcomes in under-resourced adolescents.

SO.1.01-07

Predictors of Intergenerational Malnutrition Profiles and Associations with Preschool-age Outcomes among Amazonian Children

C. Zani Rodrigues¹, H. Cogo-Moreira², A.A. Araujo Damasceno³, M. Augusto Cardoso¹, B. Hatlzhoffer Lourenço¹

¹University of São Paulo / School of Public Health, Public Health Nutrition, São Paulo, Brazil, ²Østfold University College, Department of Education, ICT and Learning, Halden, Norway, ³Federal University of Acre / Multidisciplinary Center, Cruzeiro do Sul, Brazil

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This study aimed to investigate predictors of latent malnutrition profiles in the mother-child pair at 2 years of age and their association with outcomes at preschool age.

Methods: This analysis is part of the MINA-Brazil Study, a population-based birth cohort in the Amazon region. At

SHORT ORALS

birth, 1-, 2-, and 5-year follow-ups, data were collected on sociodemographic, health, and lifestyle characteristics. Nutritional status of mothers and children was assessed using maternal BMI and WHO growth standards (height-for-age [HAZ] and BMI-for-age [BAZ] Z-scores). Child blood samples were analyzed for hemoglobin, ferritin, and vitamin A concentrations. Latent profile analysis identified malnutrition profiles at 2 years, using BIC, SABIC model fit indices, and entropy. Multinomial regression analysis identified predictors of the profiles, and equality tests of means assessed nutritional outcomes at the 5-year follow-up.

Results: Three mother-child latent malnutrition profiles were identified: “low ferritin and hemoglobin” (n=40; 5%), mean hemoglobin concentration: 10.97 g/dL (95%CI:10.27-11.67), mean ferritin: 7.71 µg/L (95%CI:5.66-10.49); “reference pair” (n=728; 85%) with all nutritional parameters within healthy cutoffs; “high maternal BMI and child BAZ” (n=86; 10%), mean maternal BMI: 28.38 kg/m² (95%CI:26.37-30.39), mean BAZ: 1.98 Z-scores (95%CI:1.49; 2.47). The chance of belonging to “low ferritin and hemoglobin” profile decreased with higher maternal schooling (OR=0.88; 95%CI:0.80-0.60) and increased in case of consumption of cow milk at 6 months of age (OR=6.69; 95%CI:1.38-32.31). Conversely, the chance of belonging to “high maternal BMI and child BAZ” profile increased with higher maternal schooling (OR=1.14; 95%CI:1.01-1.29), decreased in case of adequate pre-pregnancy maternal BMI (OR=0.27; 95%CI:0.14-0.54), and increased for each additional Z-score in child’s birth weight and in case of use of bottle-feeding at 12 months of age (OR= 1.86; 95%CI:1.17-2.97 and OR=3.70; 95%CI:1.46-9.40, respectively). Children in the “higher maternal BMI and child BAZ” profile showed significantly higher waist-to-height ratio (mean 0.55, p<0.01), HAZ (1.51, p<0.0001), and BAZ (2.77, p<0.001) at 5 years, compared to the other profiles. No differences were found for hemoglobin concentrations at age 5.

Conclusion: Intergenerational malnutrition profiles among 2-year-old Amazonian children depicted micronutrient deficiencies and excessive weight. Predictors included socioeconomic and perinatal factors, with longitudinal associations with higher adiposity indicators at preschool age.

SO.1.01-09

Differences in Elementary-aged Children’s Meal Timing between School and Summer. Three-year Findings from the What’s UP (Undermining Prevention) with Summer Observational Cohort Study

M. Savidge^{1,1}, E. Adams¹, S. Burkart¹, C. Pfledderer², RG. Weaver¹, B. Armstrong¹, K. Brazendale³, X. Zhu⁴, A. McLain⁴, B. Turner-McGrievy⁵, R. Pate¹, A. Kaczynski⁵, A. Fairchild⁶, B. Saelens⁷, H. Parker¹, M. Beets¹

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Later and inconsistent meal timing is associated with chronic disease in adults. Emerging evidence suggests similar associations among children. Few studies examine child meal timing longitudinally, which is a critical gap given established seasonal risk factors for excess summer weight gain compared to the school year. This study examined changes in absolute meal timing and consistency from the school year to summer in elementary-aged children.

Methods: Parents of n=1,298 children (ages 5-14 years, 48% girls) completed a 14-day daily diary during school (April/May) and summer (July) from 2021-2023. Parents reported times their child consumed breakfast, lunch, and dinner. Multilevel models examined changes in absolute timing (clock time) and consistency in timing (individual standard deviation, SD) from the school year to summer, controlling for child age, sex, and household income. These latter variables were further examined as moderators. Only weekdays were included in the analysis.

Results: During summer, children consumed all meals later compared to the school year (breakfast: 89.5min, 95%CI: 88.3-90.7; lunch: 53.8min, 52.8-54.9; dinner: 11.6min, 10.5-12.8). All absolute timing changes during summer were moderated by income*timepoint interactions (breakfast high-income 8.3min earlier; lunch high-income 20.6min earlier; lunch middle-income: 12.8min earlier; dinner high-income: 3.8min earlier; dinner middle-income: 3.8min earlier. Age (age*timepoint) only moderated breakfast (5.8min earlier for every one-year increase) and lunch (0.7min earlier for every one-year increase). During summer, children had less meal timing consistency with 9.2min (7.0-11.3) and 9.8min (8.2-11.4) greater SD in breakfast and lunch timing, respectively, than during the school year with no difference for dinner. Breakfast and lunch consistency was moderated only by age (breakfast: 1.7min later for every

SHORT ORALS

one-year increase; lunch:1.6min later for every one-year increase).

Conclusion: Children consumed all meals later, with slight increases in breakfast and lunch timing inconsistency during summer compared to the school year. Children from higher-income households compared to lower-income households ate earlier in the summer compared to the school year. As children grew older, they ate breakfast later and lunch earlier in summer compared to the school year. Research is needed to further understand how different summer environments influence changes in meal timing to support the development of healthful dietary habits.

SO.1.01-10

Long-term Grade-specific Weight Trends among K-12 Students Before and After COVID Related School Closures: An Interrupted Time Series Analysis

A. Altares¹, P. Ohri-Vachaspati¹

¹Arizona State University, College of Health Solutions, Phoenix, United States

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Mandatory school closures during the COVID-19 pandemic disrupted access to school meals and structured days for school-age children, especially among low-income households. This interruption exacerbated pre-existing challenges like unhealthy diets, reduced physical activity, and increased sedentary behavior—factors linked to weight gain. This study assessed short- and long-term impacts of COVID-19-related school closures on student weight status.

Methods: Using data from School Year (SY) 2013-14 to SY 2023-24 and a repeated cross-sectional design, we assessed changes in modified BMI z-scores (mBMIZ) among K-12 students (n=117,079) in four low-income New Jersey school districts. De-identified, nurse-measured height and weight data were collected at seven time points across the study period. Interrupted time series models estimated changes in mBMIZ over time by grade level, adjusting for sex, race, date of measurement, and school-level demographics. Models estimated (i) pre-COVID trends (SY 2013-14 to SY 2019-20), (ii) the change in mBMIZ from SY 2019 (pre-COVID onset measurement) to SY 2021 (first measurement, post-COVID onset), and (iii) post-COVID trends (SY 2021 to 2023). Mixed-effects logistic regression models measured changes in obesity prevalence.

Results: Before COVID-19, mBMIZ was stable across grades between SY 2013-2019 ($\beta = 0.001 - 0.054$). There was a significant increase in mBMIZ from SY 2019 to SY 2021 for grades K-6 and 8 ($\beta = 0.243 - 0.534$, $p < 0.05$), indicating a sharp rise after COVID-19-related school closures. Post-COVID slopes showed significant declines in mBMIZ for the majority of grades (K-5 and 8; $\beta = -0.182 - 0.092$, $p < 0.05$), suggesting partial recovery towards pre-pandemic levels. Adjusted mean mBMIZ scores were still higher in SY 2023 compared to SY 2019 for grades 2, and 4-9. Models examining obesity as the outcome showed similar findings.

Conclusion: COVID-19-related school closures were associated with a significant short-term increase in child mBMIZ, followed by a gradual decline after schools reopened. The impact on weight trends did vary by grade, suggesting younger students may be more vulnerable to school closures. These findings underscore the critical role of school nutrition programs and structure in supporting positive health outcomes and preventing excess weight gain among children.

SO.1.01-11

Identifying Schools with High Neighborhood Trauma Levels and Low School Meal Participation: A First Step in Trauma-informed Implementation Science Approaches to Increasing School Meal Uptake

K. Schroeder, A. Smith¹, C. Lee², A. Mykulowycz³, G.M. McLoughlin¹

¹Temple University, Social and Behavioral Sciences, Philadelphia, United States, ²Temple University, Nursing; Epidemiology and Biostatistics, Philadelphia, United States, ³Temple University, Social and Behavioral Sciences; Epidemiology and Biostatistics, Philadelphia, United States

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Trauma-informed approaches are a promising method for school programming in communities with high trauma prevalence. To date, most trauma-informed school efforts have focused on teaching or discipline, rather than health-related programs such as school meals. Providing free healthy school meals is associated with better nutrition and less food insecurity and obesity in Black and Latino/a/x students – who often have high trauma prevalence. Thus, the purpose of this study was to identify schools where school meal uptake was low and neighborhood trauma levels were high to prioritize sites for future testing of trauma-informed implementation science approaches to school meal delivery.

Methods: This cross-sectional study entailed secondary analysis of data from N=218 Philadelphia PA USA schools from school year 2024-2025 and publicly available spatial data. School meal uptake was operationalized as unadjusted percent of students per school who participated in universal free school meals per month and aggregated to the academic year. A Neighborhood Trauma Score for every Philadelphia census tract was created using 21 spatial data sources and methods validated in a prior study. School neighborhood was operationalized as school catchment, and school Neighborhood Trauma Score was calculated using area-based weights, using the percentage of census tract within each school catchment. School meal uptake and school Neighborhood Trauma Score were each categorized into 3 data-driven quantiles (high, medium, low). Following, both were mapped to assess spatial patterning and identify schools in highest quantiles of neighborhood trauma and lowest quantiles of school meal uptake. Analyses were done using R and ArcGIS.

Results: Mean school meal uptake was $56.6 \pm 15.3\%$, ranging from a minimum of 14.4% and a maximum of 86.4%. Neighborhood trauma was geographically concentrated in north, northeast, and west Philadelphia. N=5 (3%) elementary schools, N=5 (4%) middle schools, and N=1 (4.5%) met priority criteria (both lowest uptake and highest trauma quantiles). Visual inspection of maps demonstrated clusters of high neighborhood trauma and low school meal uptake in north central, south central, and northeast Philadelphia.

Conclusion: Inequities in trauma burden and school meal uptake exist across Philadelphia. Future research can focus on identifying priority schools for trauma-informed implementation science approaches to school meal delivery.

SO.1.01-13

Is Breakfast Quality Associated with Active Commuting, School Physical Activity and Sleep Duration? A Cross-sectional Study among Spanish Youth

N. Zurita-Corvalan¹, A. Ramírez-Osuna¹, Y. Barranco-Ruiz¹, P. Campos-Garzón², P. Chillón¹, X. Palma-Leal³

¹University of Granada, Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health University Research Institute (iMUDS), Granada, Spain, ²Karolinska Institutet, Department of Global Public Health, Stockholm, Sweden, ³Pontificia Universidad Católica de Valparaíso, iGEO Group, School of Physical Education, Valparaíso, Chile

SO.1.01 Children & Families: Healthy Schools: Integrated Nutrition and PA Interventions

Auditorium, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: To examine the association between breakfast quality (BQ) with active commuting to/from school (ACS), school moderate-to-vigorous physical activity (MVPA) and sleep duration (SD) in Spanish youth, stratified by age and gender.

Methods: This cross-sectional study, part of the PACO study, included 786 Spanish youth (children, 6–12 years; adolescents, 13–18 years). The sample comprised 47.3% girls. Data were collected between 2015 and 2021 from 27 schools across 11 Spanish cities. BQ was assessed using the *Spanish Youth Breakfast Consumption Questionnaire* (SYBC-Q). BQ was categorized into two groups: good/high-quality or insufficient/improvable-quality, based on the presence or absence of the main food groups (dairy, cereals, fruits, and healthy oils). ACS was assessed using the PACO questionnaire, school MVPA, using the Young Activity Profile (YAP) questionnaire, and SD was obtained from self-reported bedtimes and wake-up times. School MVPA and SD were dichotomized as meeting or not meeting international recommendations. Binomial logistic regression models stratified by age and gender were used to analyse the associations between BQ and ACS, school MVPA and SD.

Results: In the total sample, consuming a good/high-quality breakfast was significantly associated with being 1.67 times more likely to achieve adequate SD ($p = 0.003$). By age and gender, significant positive associations between good/high-quality breakfast and adequate SD were found only among adolescents ($OR = 1.66; p = 0.007$) and boys ($OR = 1.85; p = 0.014$). In addition, a near-significant trend was observed among children, where those consuming a good/high-quality breakfast were 2.25 times more likely to engage in ACS ($p = 0.055$). No significant associations were found between BQ and the other variables studied. On the other hand, interaction analyses revealed that the association

SHORT ORALS

between BQ and school MVPA differed by gender ($p = 0.031$), showing stronger association among girls, even though subgroup analyses did not reach statistical significance. No other significant interactions were observed for any of the other variables studied.

Conclusion: Good/high breakfast quality was significantly associated with adequate SD among Spanish youth, with stronger associations observed among boys and adolescents. These findings highlight the importance of promoting good-quality breakfasts to improve health-related behaviours in the school-aged population.

SO.1.02-01

Estimating Student School Meal Consumption Using Novel AI Methodology

T. Dykstra¹, E. Farahmand¹, H. Ghasemzadeh¹, N. Tasevska¹, P. Ohri-Vachaspati¹

¹Arizona State University, Phoenix, United States

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Advancements in artificial intelligence (AI) have led to its enhanced accuracy, enabling the use of AI as an effective dietary assessment tool. The implications of AI for measuring dietary intake are particularly important in school settings, where the current objective plate waste methodology can be both time-consuming and resource-intensive. Therefore, this project aimed to test the validity of innovative AI methods used for estimating the percent consumption of different components of school meals and comparing them with estimates derived from objective plate waste measurements and those made by trained observers.

Methods: Images of student lunch trays ($n=844$) were collected across five elementary public schools. Three methods were used to estimate the proportion of different food items consumed (i) estimation with AI algorithms for area and volume, (ii) plate waste methods, and (iii) estimation by trained observers. For AI estimates, the pre-consumption images were compared with post-consumption images. The images of student trays were annotated using a large language-based model, the Mobile Segment Anything model. For object detection, the AnyLabeling software was utilized to label the food items and generate segmentation masks for each object. Subsequently, an image processing method computed the difference in pixel area from the generated segmentation masks using the Shoelace formula. An AI depth estimation network was also used to estimate food item volume using a pre-trained deep learning model (Mask RCNN) and adjusting for parameters including the distance and angle between the camera and tray to predict the depth map for each food item. Standardized plate waste measures were used to estimate the weight of items pre- and post-consumption. Observer estimates were determined by trained evaluators estimating the percent consumption of food items left on each student's tray compared to pre-consumption images.

Results: The validation analyses will compare the AI area and volume percent consumption estimations with (i) the objective plate measurements and (ii) the observer estimates using Bland-Altman plots and intraclass correlation coefficient analyses.

Conclusion: The usage of AI in school settings can have important implications for facilitating data collection to inform evidence-based policies and interventions for improving the nutritional quality of school meals.

SO.1.02-02

A Novel Approach to Shaping Effective School Food Policies to Improve Children's Healthy Eating

K. Edwards¹, S. Newton², J. Blissett³, S. Higgs¹

¹University of Birmingham, Birmingham, United Kingdom, ²Birmingham City Council, Birmingham, United Kingdom,

³Aston University, Birmingham, United Kingdom

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Despite current public health guidance, most children do not meet nutrition recommendations. Schools are a key location for implementing food policies, with evidence of approaches that have positive impacts on children's diets. However, there is a lack of policy coherence due to uncertainty around how to bring effective elements together in a way that addresses barriers to implementation in schools and creates a coordinated approach across UK local

SHORT ORALS

authorities. Hence, there is a need to move towards the development of coherent and evidence-based policy that meets the needs of schools, can be implemented at scale, and shapes decision-making processes.

Methods: This collaborative study between academia, policy, and schools took a novel four-phase approach: (1) scoping of policies which aim to improve healthy eating in primary schools; (2) engagement sessions with stakeholders (primary school staff) and end-users (primary school children); (3) consultation with academics and experts in food policy; and (4) triangulation of insights gained.

Results: Phases 1-3 identified 14 separate policy components across 42 healthy eating policies. Six potential mechanisms by which the component could affect eating behaviour were also identified. The triangulation of insights showed that all policy components are appropriate for implementation in schools. Findings also suggested that 'learning about food', 'modelling', and 'eating with others' were the most likely components to be practical and effective in schools.

Conclusion: This novel approach which included multidisciplinary insights from academia, policy, and the public sector identified key policy components which can be implemented in primary schools to improve children's healthy eating. Future research is needed to develop our recommendations into a practical tool for policymakers and school staff.

SO.1.02-03

How Were Youth Perspectives Integrated in the Development of a National Ban on Harmful Food Marketing to Children – A Case Study from Norway

K. Lund-Iversen¹, I. Budin Ljøsne¹, A. Helleve¹, K.-I. Klepp^{1,2}

¹Norwegian Institute of Public Health, Oslo, Norway, ²University of Oslo, Oslo, Norway

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Youth have a recognized right to participate in the development of policies that affect them. Including their voices ensures that their unique perspectives and lived experiences are acknowledged and contributes to strengthening policy relevance and sustainability. Currently, evidence of youth involvement in national-level policymaking to promote healthier diets is scarce. This study examines the extent to which youth perspectives were integrated into the development of Norway's legislation banning harmful food marketing directed at children under 18—a pioneering policy aligned with WHO guidelines and the first of its kind globally. Our research question was: What is the content, extent, and nature of references to youth opinions and perspectives in the policy process of the proposed marketing regulation?

Methods: In August 2024, the Norwegian Ministry of Health and Care Services submitted for consultation a proposal for a new regulation prohibiting the marketing of certain food products aimed at children. We conducted a quantitative content analysis of the 109 publicly available stakeholder responses submitted to the consultation using a predefined analytical framework. The framework included key indicators to examine whether the stakeholders supported or opposed the proposed regulation, identify arguments used to justify their position, and references to youth voices, a child rights'-based approach and to other legislative frameworks.

Results: The 109 stakeholder responses were divided into five stakeholder groups; 2 (1.8 %) were from youth organisations, and 33 (30.3 %) from other NGOs or civil society organisations, which included six organisations who have child rights or youth health as main interest. Further, 46 (42.2 %) stakeholders represented the private sector or the food industry, 15 (13.8 %) were research or academic institutions and 13 (11.9 %) public authorities/agencies. Results from the analysis of the presence of youth perspectives and opinions and how they are distributed among stakeholder groups will be presented.

Conclusion: Findings from this study will reveal whether policy development at national level adequately aligns with the aspiration of integrating youth perspectives in decision-making and identify gaps that may inform strategies for meaningful youth participation in future food policy design.

SHORT ORALS

SO.1.02-05

Active Travel to School among 7–16-Year-olds in Wales: Socio-demographic Inequalities and the Role of School Policies

K. Morgan¹, S. Ouerghi¹, S. Liu¹

¹Cardiff University, DECIPHer, School of Social Sciences, Cardiff, United Kingdom

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Active travel to school (AST) offers an important source of daily physical activity and supports overall wellbeing. Despite policy interest, evidence on how schools actively promote AST remains limited at a national level. This study explores school policy efforts within a nationally representative sample, offering insight into how AST is supported across different educational settings. The study aimed to i) estimate the prevalence and socio-demographic variations of AST among 7–16-year-olds in Wales, UK, ii) assess school policy support for AST, and iii) test associations between individual and school-level factors and pupil-reported AST.

Methods: Survey data were collected from a nationally representative sample of 177,715 pupils (47.1% female). Of these, 51,662 were primary school pupils (aged 7–11 years; N=510 schools) and 126,053 were secondary school pupils (aged 11–16 years; N=204 schools). Pupil survey data were linked with a School Environment Questionnaire completed per school by a designated teacher, capturing school-level policies supporting AST. Multilevel logistic regression models examined associations between pupil (age, gender, and ethnicity) and school characteristics (socioeconomic status and location) and AST, adjusting for clustering by school.

Results: Overall, 34.1% of pupils reported AST, with higher rates among primary-aged pupils ($p < .001$). At the individual level, AST varied significantly by age, gender, and ethnicity. Pupils attending medium- or high-socioeconomic status schools were more likely, and those attending rural schools less likely, to report AST. Most schools reported at least one AST policy (primary: 96.7%; secondary: 93.3%), averaging four policies per school. These could be grouped into four types: promotion, infrastructure, training, and partnership initiatives. Among primary-aged pupils, each additional policy was associated with a 5% increase in odds of AST (OR=1.05, 95% CI: 1.01–1.09), the trend among secondary pupils was non-significant (OR=1.06, 95% CI: 0.99–1.14).

Conclusion: Schools are making considerable efforts to promote active travel, yet national findings demonstrate significant inequalities exist in reports of AST across Wales. As the first population-level analysis linking pupil and school data on active travel in Wales, these findings provide valuable lessons for policymakers seeking to design equitable, context-sensitive approaches to school-based physical activity promotion.

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Healthy food voucher programs (HFVPs) are an important fiscal tool for addressing inequities in healthy food consumption. Fresh Bucks, a HFVP in Seattle, Washington, USA, provides US\$40/month for fruit and vegetable (FV) purchases to low-income households, encouraging long-term participation and utilizing a community-supported enrollment model to engage non-English speaking households. Previous research demonstrated that Fresh Bucks participation reduced food insecurity and increased FV consumption; yet 46% of participating households chose to discontinue participation when requested to re-apply ~2 years post initial enrollment. We sought to identify factors that predict discontinuation of Fresh Bucks participation, particularly among non-English speakers.

Methods: Administrative Fresh Bucks data from Jan 2020 (first program enrollment) and Oct-Dec 2021 (program

SHORT ORALS

re-application) were used to identify those who discontinued participation (outcome); $n=12,813$. We fitted a linear probability model with predictors obtained from baseline administrative and survey data: participants' age, race/ethnicity, preferred language, program enrollment pathway (public vs. Community-based organization [CBO]-assisted), FV consumption frequency (low [$\leq 1-3$ times/month], medium [$1-2$ times/week], or high [$\geq 5-6$ times/week]), household income, presence of children, and food security status. We further stratified analysis by preferred language.

Results: Rates of discontinuation were lower among non-English (37.6%) vs. English (53.3%) speakers. In the whole sample, age ≥ 30 years (vs. 18-29 years); presence of children; an income-to-poverty ratio (IPR)=100-200% or IPR>200% (vs. IPR<100%); self-identifying as Asian (vs. White); speaking Chinese, Vietnamese, or Spanish (vs. English); being food secure (vs. insecure); and having a high or medium FV consumption (vs. low) were significantly associated with lower probability of program discontinuation. Similar factors were associated with lower probability of program discontinuation among English speakers, while only age, FV consumption, and enrollment pathway were associated with program discontinuation among non-English speakers. CBO-assisted enrollment (vs. public) was associated with lower probability of discontinuation for non-English speakers (-6.2 percentage points [pp], 95% confidence interval [CI]= -9.5, -3.0) and higher probability of discontinuation for English speakers (2.9 pp, 95%CI=0.3, 5.5).

Conclusion: Age, income, race/ethnicity, preferred language, food security, and FV consumption predicted program discontinuation. Community engagement played an important role in retaining non-English speakers. These results could inform Fresh Bucks' and similar HFVPs' retention efforts.

SO.1.02-07

A Qualitative Study of Sociocultural and Behavioral Influences on Dietary Acculturation among First-generation West African Immigrants in the United States

C. Arcan¹, E. Foka Nzaha², N. Ramezani³, E. Prom-Wormley², M. Brooks⁴

¹Pennsylvania State University, Nutritional Sciences, State College, United States, ²Virginia Commonwealth University, Epidemiology, Richmond, United States, ³Virginia Commonwealth University, Biostatistics, Richmond, United States,

⁴Virginia Commonwealth University, Family Medicine, Richmond, United States

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Dietary acculturation—the process by which immigrants adapt their eating habits to a host culture—has important implications for chronic disease. However, the concept has not been adequately studied among West African (WA) immigrants, a rapidly growing yet underrepresented population in the USA. Given the unique cultural, linguistic, and historical diversity of WA, existing acculturation measures may not accurately capture their dietary transitions. This study aimed at identifying constructs to inform the development of a dietary acculturation scale for WA immigrants in the USA.

Methods: The qualitative study was informed by the social ecological and social cognitive models. Over four months, we conducted 6 online focus groups via video conference with 30 first-generation WA immigrants (age 19-67 years) from Virginia, Maryland, and Washington, DC were conducted. Participants were stratified by length of stay in the U.S. (<10 years or ≥ 10 years; 50% in each group). Discussions explored influences on food choices, tribal identity, drivers of dietary change, and social interactions. Audio-recorded sessions were transcribed verbatim and analyzed thematically using grounded theory and MAXQDA software. To enhance credibility, member checking was performed to validate emergent themes.

Results: Countries represented included Benin, Cameroon, Ghana, Ivory Coast, Sierra Leone, Togo and Nigeria. Five major themes emerged: (1) availability/accessibility of African food, (2) cost of food, (3) social networks, (4) perceived level of adaptation to American dietary habits, and (5) preparation of African foods (time and responsibility). Subthemes frequently overlapped; ingredient availability and adapted recipes and information shared within social networks. Cost and social connections were emphasized as central to food choices and perceived adaptation. Participants with ≥ 10 years emphasized the cost and preparation time of African foods and had a higher perceived adaptation level compared to those with <10 years. Participants with <10 years emphasized procurement of African food as a factor influencing their eating habits.

Conclusion: Findings highlight the multidimensional nature of dietary acculturation among WA immigrants with variations based on duration of residence. These findings will inform the development of a culturally tailored dietary acculturation scale to guide interventions aimed at improving diet quality and reducing chronic disease risk in WA immigrants.

A Preliminary Analysis of Adolescents' Exposure to Social Media Advertisements Promoting Unhealthy Foods and Beverages and Reflection on Children's Digital Food Environment in Sweden

S. Spolander¹, H. Wieslander¹, V. Papapanagiotou¹, I. Ioakeimidis¹, F.R. Rubio²

¹Karolinska Institutet, Medicine Huddinge, Stockholm, Sweden, ²Karolinska Institute, Sweden

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces
Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Social media use is increasing within adolescent populations globally, mainly through the increased use of mobiles. Within this landscape, food and beverage marketing is dominating the digital advertisements targeting adolescents, often promoting unhealthy items, such as fast food and sugary snacks. Such marketing has been previously associated strongly with higher consumption of unhealthy foods by children. However, in Sweden, there is limited research on this matter, especially focusing on the digital food environment and social media use. Thus, this cross-sectional study measured children's exposure to food advertisements and examined long-term implications on adolescents' digital food environment.

Methods: We recruited 314 participants from high schools in Stockholm, Sweden (59.4% females; mean age: 15.6 ± 1.7 years). Screenshots of advertisements encountered during social media use were uploaded by the participants through a purpose-built mobile application (Arbisense AB). Each participant took part in two data collection actions: i) A controlled data collection session within their classroom, taking screenshots of all the advertisements encountered on social media for 10 minutes. ii) Afterwards, children continued to upload screenshots of food advertisements during real world use of social media for two weeks. Screenshots were then annotated, using an image annotation software developed internally, with the intention of describing the population's exposure to food advertisements.

Results: In total, we analysed 22,247 pictures from 314 adolescents (59.4% females; mean age: 15.6 years). Within the controlled data collection setting, we identified that 30.6% of the received advertisements marketed food, appearing with a frequency of up to 22.5 and 17.2 per hour for Instagram and TikTok, respectively. Additionally, a preliminary analysis of the advertisements collected during the 2-week real-world data collection revealed that 29.5% of advertisements marketed food or beverages and that 70.1% of those promoted products that were considered unhealthy. As before, Instagram and TikTok were the main channels for delivering advertisements to adolescents (43% and 48%, respectively).

Conclusion: The digital food environment within social media for Swedish adolescents is dominated by targeted food advertising of unhealthy foods and beverages, mainly served by Instagram and TikTok. Further studies identifying the long-term effects of this environment to food selection are needed.

SO.1.02-09

Co-creating Research and Policy Priorities to Support Healthy Food Environments in Canadian Early Learning and Child Care Settings

J. Lee¹, C. Tugault-Lafleur², A. Sebbahi², O. Koegler¹, J. Wang¹, S. Patel³, M. Dawes^{4,5}, O. Jensen^{6,4}, S. Jean-Philippe⁴, J. Omand¹, N. Bellissimo¹, M. L'Abbe⁷, J. Arcand⁸, D. Sellen⁹, M. Ahmed⁹

¹Toronto Metropolitan University, School of Nutrition, Toronto, Canada, ²University of Ottawa, School of Nutrition Sciences, Ottawa, Canada, ³Toronto Metropolitan University, School of Early Childhood Studies, Toronto, Canada, ⁴Ontario Dietitians in Public Health, Ontario, Canada, ⁵Peel Public Health, Mississauga, Canada, ⁶Renfrew County and District Health Unit, Pembroke, Canada, ⁷University of Toronto, Department of Nutritional Sciences, Toronto, Canada, ⁸Ontario Tech University, Faculty of Health Sciences, Oshawa, Canada, ⁹University of Toronto, Joanna and Brian Lawson Centre for Child Nutrition, Toronto, Canada

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces
Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Nutrition in early life is critical, shaping children's life-long diets and relationships with foods. However, there is limited information on the current state of food environments in Canadian Early Learning and Child Care (ELCC) settings, and the potential research and policy needs that could support healthy ELCC food environments.

SHORT ORALS

Therefore, the objective of this participatory research activity was to identify and co-create research and policy priorities for food environments in Canadian ELCC settings.

Methods: To identify research and policy gaps, we conducted a regulatory overview for ELCC centres and a scoping review of ELCC nutrition guidelines at the provincial and territorial levels. Based on the findings, a diverse panel of stakeholders (n=40), including researchers, dietitians, ELCC professionals, policymakers, food service providers, and other community partners, were invited to participate in virtual and/or in-person discussions to discuss facilitators and barriers to creating and supporting healthy ELCC food environments. Using a Delphi approach, stakeholders anonymously ranked research and policy questions before- and after- discussions to identify the top five priorities.

Results: Research and policy questions were developed across eight major themes: (1) diets of children attending ELCC centres; (2) long-term effects of ELCC food environments; (3) leadership and institutional support; (4) food choices and menu planning; (5) infant and early childhood feeding practices; (6) ELCC staff food and nutrition literacy; (7) budgeting and economic considerations; and (8) caregiver engagement and nutrition literacy. Approximately 30 stakeholders participated in the discussion rounds to identify the top five research and policy priorities to strengthen ELCC food environments.

Conclusion: Engaging diverse, interdisciplinary stakeholders to co-create research and policy priorities was an effective and systematic approach to integrating multiple perspectives. The stakeholder meetings also facilitated networking and collaboration among participants who might not otherwise connect. Participatory approaches to co-developing research agenda represent a promising strategy for establishing actionable priorities and advancing an understudied area of research.

SO.1.02-10

Fidelity, Acceptability and Feasibility of a Student-led Curriculum for School Wellness Policy Implementation

H. Lane¹, E. Hager², R. Deitch²

¹Duke University, Population Health Sciences, Durham, United States, ²Johns Hopkins University Bloomberg School of Public Health, Population, Family and Reproductive Health, Baltimore, United States

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces
Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Youth are critical change agents for improving nutrition and physical activity environments within schools. However, school-based advocacy trainings for youth (particularly children and younger adolescents) are difficult to implement in a school setting. This study describes implementation fidelity, feasibility, and acceptability of Student Wellness Champions for Change (SWC), an education and advocacy training focused on improving nutrition and physical activity policy implementation in U.S. elementary and middle schools.

Methods: SWC consisted of 15 lessons delivered by a wellness educator during students' lunch period. In 30-minute lessons, students learned media literacy, leadership, and policy advocacy, then took action in their schools to improve policy implementation. We assessed implementation fidelity, feasibility, and acceptability of SWC in 9 schools (5 elementary, 4 middle). Fidelity was defined as Adherence to learning objectives and Competence of delivery (3-point Likert scale), measured using the Fidelity of Implementation Observer Checklist for a subset of randomly-selected lessons. Feasibility was defined by overall number of lessons taught and lesson deviations. Acceptability was described from student focus groups and Student Engagement/Responsiveness (3-point Likert scale) on the observer checklist.

Results: For implementation fidelity, 41 lessons were observed across 9 schools. Adherence to learning objectives ranged from 56% to 100%, and Competence ranged from 2.7 to 3.0. For feasibility, the range of lessons delivered across schools was 7 to 15. Deviations occurred at every school for between 7–93% of lessons. Common deviation reasons included inadequate time, behavioral challenges, and waning student interest over time. For acceptability, average student engagement across lessons ranged from 2.0–3.0 across schools, with higher scores for middle schools. Focus group data suggest that the curriculum content was acceptable and students learned leadership skills, but missed social experiences during lunch, wanted more movement during lessons, and wanted more „quick policy wins.“

Conclusion: SWC was acceptable and useful to students, but engagement was inconsistent over time. Fidelity and feasibility varied widely across schools and lessons and deviations were common, particularly due to limited time during lunch. While lunchtime lessons ensure accessibility for all students, future efforts to implement SWC could consider before or after school time to improve fidelity, feasibility and acceptability.

SHORT ORALS

SO.1.02-12

Students' Fruit and Vegetable Consumption, Selection, and Waste Is Associated with Eating Duration Rather Than Lunch Duration

M. Curnutte¹, A. Pearce², C. Dandridge³, M. Todd³, M. McEntee³, M. Adams³, M. Bruening¹

¹The Pennsylvania State University, Nutritional Sciences, State College, United States, ²The Pennsylvania State University, Digital Strategies, State College, United States, ³Arizona State University, Tempe, United States

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Children in the United States chronically consume inadequate amounts of vegetables, fruits, whole grains, and dairy. The National School Lunch Program has the potential to improve diet quality by serving 30 million children daily meals that meet high nutrient standards. However, short lunch periods may limit students' opportunity to eat, contributing to lower fruit and vegetable (FV) consumption. Although prior research has focused on the length of the lunch period, less is known about how much time students spend eating is associated with FV intake. This study explored if eating duration is related to FV selection, consumption, and waste during school lunches.

Methods: A cross-sectional analysis was conducted using data from 37 Arizona elementary, middle, and high schools collected between 2017 and 2019. FV selection, consumption, and waste were measured using digital scales to the nearest 2 grams from pre- and post-meal tray weights. Eating duration was estimated as the interval between timestamped barcode scans of students' trays at lunch line exit and at tray disposal. Mixed-effects zero-inflated negative binomial regression models were used to estimate associations of lunch period duration and eating duration with FV outcomes, accounting for school-level clustering and student-level demographics.

Results: A 10-minute increment in lunch period length was associated with an additional 36 seconds of eating time. Every 10-gram increase in FV selected was associated with eating 3 seconds longer, and each 10-minute increment in eating time corresponded to 20 g more FV consumed and 5.5% less waste. With eating duration included in the models, lunch period length was not independently associated with FV consumption or waste.

Conclusion: Lunch period length was not associated with FV consumption or waste, suggesting that eating duration is the more meaningful factor influencing dietary outcomes. Future research can explore methods to increase students' time spent eating. Extending eating duration by 5 minutes per day could result in 50 g additional FV consumption, roughly half an extra serving of FVs per week. These findings suggest that increasing eating time, rather than simply extending lunch periods, may be more effective in improving student health and reducing food waste.

SO.1.02-13

Practices and Capacity to Promote Health and Wellbeing across Key Childcare, Healthcare, and School Settings: Results from Five Danish National Surveys

I. Rask Heuck¹, A. Beske Almstrup¹, T. Holmberg¹, A. Vang Hjort¹

¹Centre for Childhood Health, Copenhagen, Denmark

SO.1.02 Policies and environments: Shaping Healthy Eating in Schools and Digital Spaces

Room 1, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: To strengthen system-wide capacity for health promotion, more knowledge is needed about existing practices and enabling factors across sectors that influence children, youth, and families. This study introduces a coordinated national effort to assess practices and capacity for promoting health and wellbeing across five Danish settings: (1) general practice (GP), (2) childcare institutions, (3) primary and lower secondary schools, (4) after-school services, and (5) municipal administration.

Methods: Survey development followed established methodological guidance, including: (1) literature review and mapping of existing instruments, (2) qualitative interviews and a Delphi process with national experts, and (3) pilot testing. A key methodological focus was the operationalization of setting-specific health promotion capacity indicators while ensuring comparability through shared core items. The school and GP surveys were conducted with Statistics Denmark, using national employment registers for sampling and distributed via the national digital mail system (e-Boks). The school survey was fielded in summer 2025 to a random sample of ~30,000 leaders and staff, while the GP survey was distributed to the full population of ~9,000 GPs and clinic staff in autumn 2025. During winter 2025, Epinion Consultancy will collect data from smaller, targeted samples – including n=2,100 childcare institutions

SHORT ORALS

and n=1,600 after-school institutions - and data collection at the administrative municipal level will cover all 98 Danish municipalities.

Results: To date, n=8,125 school professionals (n=1,124 principals and n=4,826 staff) and n=1,234 respondents from the GP sector have completed the survey. The GP sample included n=343 general practitioners, n=201 doctors in training, n=532 nurses, and n=158 other clinic staff. Preliminary analyses within school settings indicate that principals report higher levels of health promotion capacity than staff, and that the capacity varies across health domains – for example, being higher for promoting social relations than for nutrition. When data collection across all settings is complete, descriptive analyses will provide a national overview of key capacity dimensions, such as perceived knowledge and competencies, motivation, and organizational conditions.

Conclusion: This study provides the first comprehensive assessment of practices and capacity for health and wellbeing promotion across Danish school, childcare, and healthcare systems – and will inform tailored strategies to strengthen professional competencies and organizational capacity.

SO.1.03-01

School-based Interventions to Improve Fruit and Vegetable Intake among Latin American Children: A Scoping Review

A. Gonzalez¹, S. Kapukotuwa¹, A. Awan¹, M. Sharma¹

¹University of Nevada Las Vegas, School of Public Health, Las Vegas, Nevada, United States

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This scoping review synthesized evidence from school-based interventions to increase fruit and vegetable (FV) consumption among children aged 6–12 years in Latin America and examined how intervention design and behavioral theories relate to dietary outcomes. We highlight the features of effective, scalable interventions in low- and middle-income settings, with a particular focus on experiential components and school food environments.

Methods: A scoping review of PubMed, Web of Science, APA PsycINFO, and CINAHL was conducted following the PRISMA-ScR guidelines, identifying studies targeting FV consumption among children aged 6–12 years in Latin American schools. Eligible designs included randomized controlled trials, quasi-experimental studies, and single-group pre-post designs with FV-related outcomes. Studies were included if they evaluated school-based programs or policies and were published in English, Spanish, or Portuguese; protocols, reviews, descriptive studies, and grey literature were excluded. Study selection followed a PICOS framework; data were charted on setting, design, theoretical framework, intervention components, and outcomes, and synthesized narratively.

Results: We identified 59 eligible interventions from Latin American school settings, ranging from small pilot studies to large cluster-randomized trials. Most were multi-component. Social Cognitive Theory was the most frequently used framework, alongside the Theory of Planned Behavior, socio-ecological models, and game-based or experiential learning approaches; however, many studies did not explicitly report a guiding theory. FV intake was the most common primary behavior, and most interventions reported significant improvements in FV intake or related diet indicators, particularly when programs combined classroom nutrition education with hands-on cooking or gardening, cafeteria or canteen changes, and parental engagement. Across studies, nutrition knowledge and psychosocial constructs (preferences, self-efficacy, attitudes) improved more consistently than FV intake, especially in short, curriculum-only, or low-dose programs. Implementation fidelity, intensity, and alignment with the school food environment emerged as key determinants of effectiveness and sustainability.

Conclusion: School-based programs in Latin America can improve children's FV-related knowledge, preferences, and, under the right conditions, intake. The most effective interventions are theory-driven, multi-component, and experiential, targeting classroom learning, food environments, and family contexts. Future research should prioritize the use of theory, standardized outcomes, fidelity tracking, and cost-effectiveness to support scalable behavioral nutrition policies and practices.

SHORT ORALS

SO.1.03-02

Perceived Experiences, Barriers, and Facilitators of Sedentary Behaviour, Physical Activity and Dietary Behaviour among Hybrid Workers while Working from Home

K. Mehta¹, S. Clemes¹, N. Paine¹, C. Harpham¹, E. Stamp¹

¹Loughborough University, Loughborough, United Kingdom

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Since the COVID-19 pandemic, there has been an increase in hybrid working amongst desk-based workers. On home working days, greater sitting time, lower physical activity levels, and increased calorie intake have been reported compared to office working days. There is limited understanding of the factors that influence enacting such health-related behaviours when working from home. The aim of this study was to understand perceived barriers and facilitators which could inform future potential intervention components, designed to help reduce sedentary behaviour, increase activity levels, and improve dietary behaviours while working from home.

Methods: Semi-structured interviews with 15 hybrid workers were conducted. The interview schedule was informed by the Theoretical Domains Framework (TDF) and Capability, Opportunity and Motivation - Behaviour (COM-B) model to understand perceived barriers and facilitators to increasing activity, reduce sedentary behaviour and improve dietary behaviours. Interviews were transcribed and inductively analysed using reflexive thematic analysis, then mapped deductively onto COM-B and TDF.

Results: Hybrid workers had mixed perceptions of their levels of sedentary behaviour and physical activity. Key barriers to reducing sedentary behaviour and increasing movement while working from home included small indoor home working environments, lack of motivation, workload and workflow demands, mindset and guilt of online presence, lack of knowledge, and sedentary work lifestyle. To facilitate behaviour change, key enablers included habit formation and increased motivation supported by the availability of equipment, environmental prompts, increased knowledge, and goal setting. Employers' help and support were seen as important factors in enabling these changes. The home working environment was perceived as more supportive of healthier dietary behaviours compared to the office working environment, offering individuals greater capability, and providing a more conducive setting for making conscious efforts to improve diet quality.

Conclusion: Many participants perceived home working environments to negatively impact sedentary behaviour and physical activity levels. Key perceived barriers and facilitators to behaviour change in the home setting were identified. These results suggest a need for intervention to reduce sedentary behaviour and increase activity levels on home working days. Home working was perceived to support healthier dietary behaviours, indicating less need for intervention development in this area.

SO.1.03-03

Psychometric Validation of the Short Nutrition Literacy Scale for Adults in the United States

J. Baum¹, A. Hawley¹, E. Howie², S. Boudrey¹, X. Liang³, E. Calloway⁴, E. Short⁴

¹University of Arkansas System Division of Agriculture, Center for Human Nutrition, Food Science, Fayetteville, United States, ²University of Arkansas, Exercise Science, Fayetteville, United States, ³University of Arkansas, Educational Statistics and Research Methods, Fayetteville, United States, ⁴Center for Nutrition and Health Impact, Omaha, United States

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Validated tools to assess nutrition literacy among U.S. adults are limited, particularly those that are brief, mobile-friendly, and capture multiple literacy domains. This study evaluated the validity, reliability, and feasibility of the Short Nutrition Literacy Scale for Adults (SNLS-USA), an internally developed instrument measuring functional, interactive, and critical nutrition literacy. Developed within the Delivering Food, Exercise, and Nutrition Education for the Prevention of Chronic Disease (DFEND) project, the SNLS-USA advances prior work by confirming its three-factor

SHORT ORALS

structure and refining the tool for large-scale implementation.

Methods: The SNLS-USA was developed through literature review, expert panel review (n = 10), and a community-based focus group (n = 15). The pilot survey was administered via Qualtrics to 800 U.S. adults (mean age = 43.6 ± 13.8 y; 68% female). All items were rated on a 5-point Likert scale ranging from *Strongly Disagree* to *Strongly Agree*. Parallel analysis and exploratory factor analysis were conducted to identify the underlying factor structure. Confirmatory factor analysis (CFA) using maximum likelihood estimation validated three domains: Functional Knowledge, Interactive/Motivation, and Critical Literacy/Advocacy.

Results: Across the full sample (n=800), item means ranged 3.4–4.2 with modest variability and minimal ceiling effects. Parallel analysis suggested up to seven factors, but the three-factor model showed adequate fit (RMSEA = 0.061, CFI = 0.872, TLI = 0.840) and conceptually represented functional, interactive, and critical literacy. Refinement from 31 to 16 items yielded a concise, psychometrically sound scale with coherent domain loadings (e.g., advocacy 0.62–0.89; subskills 0.56–0.83) and minimal cross-loading, supporting the intended multidimensional structure.

Conclusion: The SNLS-USA demonstrates adequate validity, reliability, and theoretical alignment across the three domains of nutrition literacy: functional, interactive, and critical. The tool provides a brief measure for assessing nutrition literacy among adults in the United States.

SO.1.03-04

Factors Influencing Dietary and Physical Activity Behaviours among Adolescents in Urban Ghana and Kenya: Qualitative Insights from Key Stakeholders in the Generation H Study

G. Amevinya¹, R. Pradeilles¹, E. Landais¹, A. Laar², G. Asiki³, E. Beune⁴, L. Sherar⁵, P. Griffiths⁵, S. Vandevijvere⁶, C. Agyemang^{4,7}, M. Holdsworth¹

¹UMR MoISA (Montpellier Interdisciplinary Centre On Sustainable Agri Food Systems), (Univ Montpellier, CIRAD, CIHEAM-IAMM, INRAE, Institut Agro, IRD), Montpellier, France, ²Department of Population, Family and Reproductive Health, School of Public Health, University of Ghana, Accra, Ghana, ³Chronic Disease Management Unit, African Population and Health Research Center, Nairobi, Kenya, ⁴Department of Public & Occupational Health, Amsterdam Public Health Research Institute, Amsterdam UMC, University of Amsterdam, Amsterdam, Netherlands, ⁵School of Sport, Exercise and Health Sciences, Loughborough University, Loughborough, United Kingdom, ⁶Sciensano, Department of Epidemiology and Public Health, Brussels, Belgium, ⁷Department of Medicine, Division of Endocrinology, Diabetes and Metabolism, The Johns Hopkins University School of Medicine, Baltimore, MD, United States

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Dietary, and physical activity behaviours are shaped by multiple factors at multiple level. Developing a contextualised behavioural intervention to change unhealthy behaviours necessitates apriori understanding the underlying influencing factors. This study explored factors influencing adolescents' (10 -19 yr) dietary and physical activity behaviours in urban Ghana and Kenya, and the mechanisms through which these factors operate.

Methods: As part of the Generation H (<https://www.generationh.org/>) study, 362 participants including adolescents, parents, church leaders, health and educational professionals were engaged through 38 focus groups and 45 in-depth interviews in Ghana and Kenya. During analysis, influencing factors were identified with both theory-driven (i.e. mapping factors onto a socio-ecological framework (individual, social, physical and macro environment levels) and data-driven (i.e. emerging themes) approaches. The mechanisms through which these factors operate to influence behaviours were mapped onto the COM-B model: *Capability* (psychological and physical), *Opportunity* (physical and social) and *Motivation* (automatic and reflective).

Results: Twenty-four factors were identified and operated across multiple socio-ecological levels. Most factors (n=10) occurred at the individual level, while the social (n=7) and physical (n= 6) environmental levels showed a relatively even distribution of influencing factors. At the individual level, limited diet and physical activity knowledge and skills reflected reduced *Capability*, while financial challenges, time constraints and competing priorities limited *Opportunity*. Social influences, such as unhealthy household diet and inactive behaviours and negative peer influence hindered social *Opportunity* and *Motivation*. The physical environments (availability and accessibility of (un)healthy foods and physical activity equipment and facilities (i.e. recreational spaces) at home, school and neighborhood influenced *physical Opportunity*. At the macro level, unhealthy food marketing, constrained *Opportunity* and undermined *Motivation* to consume a healthy diet.

Conclusion: Our findings underscore the complex multi-level factors influencing adolescents' diet and physical activity

SHORT ORALS

behaviours in the studied settings. These factors span multiple socio-ecological levels, which influences adolescent's *Capability, Opportunity* and *Motivation* to adopt healthy diet and physical activity behaviours. The Generation H study now has the information needed to design an intervention to improve dietary and physical activity behaviours among adolescents which integrates capability enhancing components, social support and motivation, and actions to create supportive physical opportunities.

SO.1.03-05

Exploring Experiences of Remote Call Centre Workers and the Barriers and Challenges Towards Enacting Health Behaviours: A COM-B and Theoretical Domains Framework-based Interview Study

C. Harpham¹, S. Clemes¹, N. Paine¹, M. Fray², K. Mehta¹, E. Stamp¹

¹Loughborough University, School of Sport, Exercise and Health Sciences, Loughborough, United Kingdom, ²Loughborough University, School of Design and Creative Arts, Loughborough, United Kingdom

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Recently, remote working has become increasingly common. Whilst working remotely has benefits, it can lead to harmful behaviours such as reduced physical activity, increased sedentary time and poor diet. Call centre workers have been found to be at particular risk, compared to those in other sectors. Therefore, this study aimed to examine the experiences of remote call centre workers (RCCW) the impacts of remote working on health and lifestyle behaviours, and the barriers and strategies related to adopting healthier routines. Findings would inform the development of a tailored health behaviour intervention.

Methods: This study employed an interview-based interpretive thematic qualitative approach. One-to-one online interviews were conducted with RCCW from a national UK charity. Guided by the COM-B model and Theoretical Domains Framework (TDF), the interview schedule focused on the capability, opportunity, and motivation of remote workers to adopt healthy behaviours. Topics included lived experiences of remote working, perceived impacts on health behaviours, psychological and physical health, challenges to adopting healthy behaviours, strategies to overcome these, and workplace ergonomics. Verbatim transcripts were analysed on NVivo using inductive thematic analysis to generate themes which were then deductively aligned to the COM-B and TDF.

Results: Twenty RCCW (19 female, 1 male), aged 30–62 with 6 months to 22 years role experience, participated in 30-minute interviews. Themes were categorised into positive and negative factors, and potential strategies. Positive factors included convenience, lack of commute, organisational facilitators of health behaviours such as comprehensive ergonomic provision, health awareness, and reduced expenses. Negative factors involved organisational barriers to health behaviours such as reduced empowerment due to time and service optimisation, and impacts such as increased sedentary behaviour, declining physical health, and social isolation. Strategies to improve health behaviours included flexible scheduling and monitoring, active meetings, and organisation-led group physical activity initiatives.

Conclusion: The psychological capability and physical opportunities for RCCW to increase physical activity appear well supported. However, RCCW generally remain sedentary and feel socially isolated. These findings can inform intervention to ensure organisations promote social opportunities, and nurture reflective and automatic motivation among RCCW to capitalise on existing movement opportunities.

SO.1.03-06

Do Social Norms Amplify or Dampen the Relation between Climate Worries and Pro-environmental Health Behavior? Evidence from a Dutch Nationally Representative Panel (2019 – 2024)

D. Beeres¹, S. Lipman², L. Kokai³, K. Rhode⁴, F. van Lenthe¹, J. Oude Groeniger¹

¹Erasmus MC Medical Center, Rotterdam, Netherlands, ²Erasmus University, Rotterdam, Netherlands, ³Wageningen University and Research, Wageningen, Netherlands, ⁴Maastricht University, Maastricht, Netherlands

SHORT ORALS

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Transitions toward plant-based diets and reduced car use are key for planetary and population health but remain difficult to achieve despite increasing public concern about climate change. This study investigates whether social norms amplify or dampen the relationship between climate worries and two pro-environmental health behaviors: meat consumption and car use for short distances. We further explore whether these associations differ by income and urbanicity.

Methods: We used longitudinal data from the Dutch Longitudinal Internet Studies for the Social Sciences (LISS) panel (N = 1,708), collected in 2019, 2023, and 2024. Climate worries were measured regarding personal and global impacts. Descriptive and injunctive social norms were assessed in 2023 for both behaviors. We applied within-between mixed-effects models with random intercepts for individuals to separate intra-individual changes from stable between-person differences. Models included interactions between climate worries and perceived social norms, adjusted for age, gender, income, and urbanicity. Analyses were stratified by income and urbanicity.

Results: Between-person differences in climate worries were associated with lower meat consumption ($\beta = -0.12$, 95% CI: $-0.18, -0.07$) and less frequent car use ($\beta = -0.14$, 95% CI: $-0.21, -0.07$). However, within-person increases in climate worries were not linked to behavioral change over time. Descriptive norms strongly predicted behavior, particularly for meat consumption ($\beta = -0.41$, 95% CI: $-0.45, -0.37$), but did not moderate the relationship between climate worries and behavior. No consistent variation was observed across income or urbanicity strata.

Conclusion: Although climate worries are rising, they do not automatically translate into behavioral change. Social norms appear to influence sustainable behaviors directly rather than by amplifying the effects of worry. Promoting population-level transitions toward sustainable diets and active transport therefore requires shifting prevailing social norms and structural conditions, making sustainable choices easier, more visible, and socially endorsed.

SO.1.03-08

Barriers and Facilitators Associated with Health-enhancing Behaviours among Bus Drivers

S. Clemes¹, M. Sayyah¹, J. King¹, E. Stamp¹

¹Loughborough University, Loughborough, United Kingdom

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Bus drivers' working environments are not conducive to health-enhancing behaviours, with their job involving prolonged sitting, limited opportunities for movement, long working hours and shift work. Bus drivers have been identified as high-risk, in terms of health conditions, and are underserved in terms of health promotion efforts. There is a dearth of evidence in UK bus drivers on potential facilitators and barriers to enacting health-enhancing behaviours. This study therefore examined health challenges, and facilitators and barriers to adopting healthy behaviours in a sample of bus drivers, to inform tailored interventions.

Methods: Face-to-face semi-structured interviews with bus drivers were conducted at their worksite. Interview content was informed by the Theoretical Domains Framework (TDF) and Capability, Opportunity and Motivation - Behaviour (COM-B) model to understand barriers and facilitators to enacting health-enhancing behaviours. Interviews were transcribed verbatim and analysed inductively using thematic analysis then deductively mapped onto the COM-B model and TDF.

Results: 39 bus drivers (90% male, average age ($\pm$ SD): 47 $\pm$ 11 years) provided interview data. Chronic conditions including diabetes, hypertension, sleep apnoea, and obesity were reported by participants as widespread among bus drivers. Knowledge of contributory risk factors was demonstrated, with participants identifying irregular shifts, limited access to nutritious food, the sedentary nature of the job, inadequate facilities, and workplace stress as major contributors to poor health in drivers. It was also frequently reported that male drivers are less likely to proactively seek healthcare support. To facilitate improvements in drivers' health, participants identified the need for health behaviour-focused education/training to improve knowledge and awareness of health in general and of health-enhancing behaviours. The need to improve aspects of the working environment was identified, with particular emphasis on access to healthier food options, adequate restroom access, and revised policies to address driver fatigue and working hours. The provision of onsite wellness checks was identified as a potential solution to address barriers in accessing healthcare support.

Conclusion: Participants identified multiple barriers faced by bus drivers to engage in health-enhancing behaviours.

SHORT ORALS

This study highlights the need for multi-component interventions targeting the individual, environment and policy, to improve bus drivers' working conditions and health.

SO.1.03-09

Physical Activity and Gestational Weight Gain in the Brazilian Birth Cohort

T. Ramos Flores¹, B. Pereira Nunes¹, O. Amaral de Andrade Leao¹, A. Wendt², I. Crochemore-Silva³, G. Iven Mielke⁴, M. Rodrigues Domingues³, M. Freitas da Silveira³, P. C Hallal¹

¹University of Illinois, Health and Kinesiology, Champaign, United States, ²Pontifícia Universidade Católica do Paraná, Curitiba, Brazil, ³Federal University of Pelotas, Pelotas, Brazil, ⁴The University of Queensland, Brisbane, Australia

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Excessive gestational weight gain is associated with gestational diabetes, hypertension, cesarean section, postpartum weight retention, macrosomia, and child obesity. The guidelines suggest physical activity as an effective strategy for preventing excessive gestational weight gain. This study aims to investigate the relationship between physical activity during pregnancy and gestational weight gain.

Methods: Mothers who participated in the 2015 Brazilian (Pelotas-RS) Birth Cohort study were analyzed. Physical activity (PA) was measured using the nondominant wrist accelerometer model wGT3X-BT (ActiGraph, Pensacola, FL). Moderate-to-vigorous physical activity (MVPA) were measured in bouts of 5 minutes (MVPA 5-min bout). Activities were characterized as sustained, and overall physical activity was expressed in mg, and MVPA (non-bouted) activities were characterized as not sustained. A woman's weight is calculated as gestational weight gain (GWG) at the end of gestation minus the prepregnancy weight, and categorized as adequate, insufficient, and excessive, according to the classification of the U.S. Institute of Medicine (IOM). Linear regression models were used to evaluate the association between PA and GWG.

Results: The original sample of the Cohort was composed of 4,219 mothers. The analytical sample consisted of 1,938 women with information on PA and GWG. The mean GWG in the analytical sample was 12,030.78 g (SD = 6,658.8), and 35.7% (95%CI 34.2; 37.2) of women presented excessive GWG, according to prepregnancy Body Mass Index (BMI). The mean of moderate-to-vigorous physical activity was 95.1 minutes (SD = 42.3), and when considering only the activities lasting at least five consecutive minutes, it was 15.2 minutes (SD = 16.7). After adjustments, for every 15 minutes of sustained physical activity (MVPA 5-min bout), the GWG decreased by 369.2 g [β = -369.2 (95%CI: -644.8; -93.6)].

Conclusion: MVPA with 5-min bouts is associated with lower GWG. New studies could focus on understanding the main barriers to engaging in physical activity during pregnancy.

SO.1.03-10

Should Dental Practices Introduce Routine Screening of Weight and Offer Weight Management Interventions to People Living with Obesity?

J.F. Large¹, C. Madigan¹, A.J. Daley¹

¹Loughborough University, Centre for Sport and Exercise Medicine, Loughborough, United Kingdom

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Innovative collaborations across healthcare are required to support the increasing number of people living with obesity and associated comorbidities including cardiovascular disease and type 2 diabetes. Dental teams may be well placed to provide weight screening and support given their contact with millions of people every year, but research is limited on whether this approach would be acceptable to the public and dental professionals.

Methods: First, a systematic review and meta-analysis synthesised the evidence concerning the views of the public and dental teams about delivering weight screening and weight management interventions in dental settings. Five databases were searched from inception to 3 April 2023. Proportional meta-analyses and thematic analysis were used to summarise data. Secondly, a survey explored acceptability amongst the public about receiving weight management interventions led by dental teams. Participants were recruited from 22 dental sites in England and the NIHR Be Part of Research Service.

SHORT ORALS

Results: 7,851 studies were screened and 33 were eligible for inclusion. The average prevalence of height/weight screening in dental settings was 29% (range:4%–87%; 95% CI:14–46). A significant proportion of the public were supportive of weight screening (83%;95% CI:76–88) and discussion (85%;95% CI:70–96) in dental settings. Enablers of discussion by dental professionals included associating weight with oral health. Fear of offending patients was the barrier reported most often (57%;95% CI:45–68).

3580 adult participants completed the survey and 60% (n=2055/3430) reported they would be comfortable with their height/weight being measured by dental professionals. 57% (n=1915/3375) reported it would be acceptable for their dental professional to offer weight management support. Male (OR:1.79,95% CI:1.49–2.13) and non-White ethnicity (OR:1.62,95% CI:1.11–2.37) participants had significantly increased odds of accepting support. The most acceptable form of support was information on local weight management programmes (n=1989/2379, 83.6%). 57.5% (n=399/694) of parents/carers felt comfortable with their child's height/weight being measured.

Conclusion: There is support from dental teams to offer weight management interventions to patients. The public appear receptive to receiving this novel approach to care. The feasibility of delivering weight screening and support in routine dental settings are required, to ensure it can be implemented into existing dental services.

SO.1.03-11

Combinations of Lifestyle Behaviours and Diabetes Incidence: A Bayesian MAIHDA Survival Analysis of 259,448 UK Biobank Participants

A. Swain¹, N. Pearson¹, S. Willis¹, W. Johnson¹, G. Leckie², A. Finke³

¹Loughborough University, School of Sport Exercise and Health Sciences, Loughborough, United Kingdom, ²University of Bristol, Centre for Multilevel Modelling (CMM), Bristol, United Kingdom, ³Newcastle University, School of Mathematics, Statistics and Physics, Newcastle upon Tyne, United Kingdom

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Lifestyle behaviors often cluster and interact to influence health outcomes, yet their combined influence on type 2 diabetes (T2D) onset remains unclear. Understanding how these behaviors interact helps distinguish independent from joint effects and guide prevention strategies. This study examines how adherence to multiple lifestyle recommendations influences diabetes onset.

Methods: We analysed data from 259,448 adults (52% men) in UK Biobank, followed for up to 16 years for diabetes incidence. Four behaviours (fruit and vegetable intake, physical activity, sleep duration, and alcohol intake) were classified as meeting or not meeting public health guidelines; smoking was categorised as never, former, or current. Combining the categories of the five lifestyle behaviours resulted in 48 lifestyle strata, each representing a unique pattern of adherence to public health recommendations. Sex-stratified Bayesian Weibull survival multilevel analysis of individual heterogeneity and discriminatory accuracy (MAIHDA) models were fitted with individuals nested within strata. Three models were tested: Model 1 (null), Model 2 (adding lifestyle behaviours), and Model 3 (adding lifestyle behaviours plus confounders). Posterior summaries provided variance partitioning coefficients (VPC), proportional change in variance (PCV), and median diabetes-free survival times by lifestyle strata.

Results: During follow-up, 8,204 men and 3,365 women developed T2D. In Model 1, 11% of variance in diabetes onset was attributable to between-strata differences. In Model 2, VPCs dropped to 0.7% in men and 0.5% in women, indicating that most between-strata variance was explained once individual lifestyle behaviors were included. Large PCVs indicated that >93% of the between-strata variance from Model 1 was explained by additive effects. Strata-specific predictions revealed men and women with the longest diabetes-free survival met most recommendations, while those with the shortest met fewer. Strata with the longest predicted survival consistently included never smoking and meeting physical activity guidelines.

Conclusion: Our findings show that variation in diabetes onset was primarily driven by additive rather than multiplicative effects of lifestyle behaviours. Each additional recommendation met extended diabetes-free survival, underscoring the cumulative benefit of healthy behaviours. This supports a cumulative approach to diabetes prevention, whereby even small, lifestyle improvements, especially increasing physical activity and avoiding smoking, can substantially delay diabetes onset.

SHORT ORALS

SO.1.03-12

Cycle Nation - A Feasibility Study of a Multi-component Community-based Cycling Intervention

E. Lawlor¹, F. Gabler Trisotti¹, C. Gray¹, J. Gill¹

¹University of Glasgow, Glasgow, United Kingdom

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Cycling offers health and environmental benefits, yet participation in the UK remains low. Community-based organisations have the potential to support cycling uptake, but many existing programmes are short-term or single component, limiting sustained behaviour change. Cycle Nation (CN) is a 9week, multi-component group-based intervention developed for adults who have not recently cycled. Originally workplace-based, this project aims to assess the feasibility of delivering CN in community settings in Glasgow to support adults to cycle more.

Methods: CN was adapted for community settings and delivered by trained facilitators from a local cycling charity. The programme combined practical cycling skills, bike maintenance, and behaviour change techniques, with participants offered a free bicycle, ebike loan, or repairs to overcome financial barriers. Pre and postintervention online questionnaires assessed cycling engagement (leisure, commuting, errands; frequency and duration), transport use (car, public transport, walking), cycling confidence, motivation, vitality, and self-esteem. Attendance and completion were recorded. All sessions were observed, and interviews were conducted with participants (n=15) and facilitators (n=3) to understand their experiences. Quantitative data were analysed descriptively, while qualitative data was thematically analysed.

Results: A total of 32 participants (74% female) were recruited, with a completion rate of 84%. Completing participants reported increases in cycling at post-intervention: 5.2 more rides and 144.3 additional minutes per week, including leisure rides (+1.97 rides, +88.0 minutes/week), commuting (+1.8 rides, +38.4 minutes/week), and errands (+1.4 rides, +17.8 minutes/week). Private car use decreased, and confidence and vitality increased, although self-esteem decreased. Post-intervention interviews highlighted participants' positive experiences, describing it as a "very worthwhile experience", being part of a group as "very powerful" and reporting mental and physical benefits gained, boosting confidence and encouraging higher physical activity levels.

Conclusion: This study demonstrates that delivering CN in the community is highly feasible and was positively received by participants and facilitators. Cycling levels increased and there was high recruitment and retention rates. Community-based cycling organisations should consider delivering CN in the future. Currently, a randomised controlled trial is underway across Glasgow, delivered by multiple cycling organisations, to provide robust evidence of its effectiveness and cost-effectiveness, alongside a process evaluation.

SO.1.03-13

Promoting Healthy Behaviors after Colonoscopy through a Targeted Risk-based Lifestyle Intervention: Findings from the PRECÔTION Study

O. Pérol^{1,2}, M. Langlois¹, R. Mongondry¹, A. Maire¹, A. Goerens¹, P. Funk³, T. Ponchon³, B. Fervers^{1,2}, A. Cattey-Javouhey³

¹Centre Léon Bérard, Prevention Cancer Environment, Lyon, France, ²INSERM U 1296, Lyon, France, ³Centre Léon Bérard, Medical Oncology, Lyon, France

SO.1.03 Motivation and Behavior Change: Nutrition Behavior: Policy, Messaging, and Dietary Outcomes
Room 2, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Colorectal cancer (CRC) is largely preventable through lifestyle changes targeting diet and physical activity. Colonoscopy offers a timely opportunity to promote awareness of CRC risk factors. PRECÔTION is a digital intervention using motivational and community-based strategies to encourage preventive actions based on individual risk level. This study assessed its feasibility, acceptability, adherence, and preliminary impact on lifestyle behaviors and CRC risk awareness.

Methods: PRECÔTION was a single-center, prospective, single-arm interventional study. Participants with a normal colonoscopy result were assigned to one of three risk groups (low, moderate, high) based on physical activity (IPAQ), dietary behavior (WCRF), and BMI. Over six months, all participants received personalized digital support (videos,

SHORT ORALS

podcasts, interactive app) using motivational strategies. Group physical activity sessions and health education workshops were offered depending on risk level. High-risk participants also received individual motivational coaching and a connected watch to track daily steps. Initial and final assessments measured behavioral changes and satisfaction.

Results: Between October 2022 and October 2023, 90 participants were enrolled (n=33 low risk, n=21 moderate risk, n=36 high risk), with a mean age of 53 years and 69% women. The intervention showed good feasibility: 60% of participants who completed follow-up engaged with all tools provided, with higher adherence in moderate and high-risk groups (62%) compared to low-risk (56%). Early outcomes were promising, with notable improvements in lifestyle scores (WCRF: +0.44 and +1.12) and physical activity levels (+5.09 and +7.45) in moderate and high-risk groups, respectively. Overall, 38.6% of participants improved their WCRF score by at least one point—rising to 61.9% in the high-risk group—highlighting the program’s potential to drive meaningful behavior change.

Conclusion: The PRECÔTION study demonstrates that a personalized, risk-based digital intervention is both feasible and well accepted among individuals undergoing colonoscopy. The program showed good levels of commitment and promising behavioral improvements, particularly in individuals with unhealthy lifestyles. These findings suggest that colonoscopy can serve as a strategic entry point for initiating lifestyle change. Scaling up this approach through a randomized controlled trial could validate its effectiveness in reducing modifiable risk factors and ultimately contribute to lowering the incidence of preventable CRC.

SO.1.04-01

Using Fuzzy Cognitive Mapping to Include the Voices of Equity Deserving Groups in Framing Age-friendly Community Science Initiatives

S. Dogra¹, A. Olatinwo¹, M. Lochan-Aristide¹

¹Ontario Tech University, Faculty of Health Sciences (Kinesiology), Oshawa, Canada

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The purpose of this work is to understand the needs of older adults to inform the development of community science initiatives that support active aging and age-friendly communities. Due to the historic exclusion of the voices of older adults from equity deserving groups, a particular emphasis was placed on recruitment of older adults who identified as BIPOC (Black, Indigenous, People Of Colour), LGBTQSIA2+, linguistic minorities, religious minorities, or low income.

Methods: Community champions were identified through municipal partners across the Region of Durham (Ontario, Canada, population ~750,000) to support recruitment. Eligible older adults completed consent, an online survey, and participated in a fuzzy cognitive mapping session. Fuzzy cognitive mapping is a method used in participatory action research that allows participants to generate their own ideas, and work in homogenous groups to create maps and priorities. The center of each map included the following question: *As a resident in the Region of Durham, what is the biggest local concern you would like to see fixed/addressed?* Participants were placed in groups of 5-8, and were given 90-120 minutes to complete the activity. Data collection is ongoing, and will be analyzed using mixed methods approaches that allow for issues to be prioritized according to weights inputted on the map by participants.

Results: Preliminary data indicate that while there are some commonalities in terms of the challenges that older adults face, the issues that older adults from equity-deserving groups face are distinct, and often unaddressed. For example, older adults from equity-deserving groups are highlighting their needs for employment, more affordable programming and financial aid, engagement in civic opportunities through a trusted community contact, and job retraining. Such programming requests did not arise among white Canadians, even those from low-income groups.

Conclusion: Our work is highlighting the need to engage with older adults from equity deserving groups to redefine our concept of healthy, active aging and age-friendly communities. This work can be used to inform the development of community science programs that address the needs of older adults and address health inequities.

SHORT ORALS

SO.1.04-03

Morning-dominant MVPA Is Associated with Lower Extracellular Water in Older Adults: A Waist-worn Accelerometry Study

T.-F. Lai¹, Y. Liao¹

¹National Taiwan Normal University, Graduate Institute of Sport, Leisure and Hospitality Management, Taipei, Taiwan

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Extracellular water percentage (ECW%) is a sensitive marker of cellular health and muscle quality in older adults. While total moderate-to-vigorous physical activity (MVPA) benefits body composition, the role of MVPA timing remains unclear. We examined whether the diurnal distribution of MVPA is associated with ECW% in community-dwelling older adults.

Methods: We analyzed 172 adults aged ≥ 65 y (mean 72.0 y; 78.5% women). Physical activity was measured with a **waist-worn ActiGraph GT3X+** for 7 consecutive days and processed in ActiLife using **Troiano et al., 2007 cut-points** (≥ 2020 counts $\cdot$ min⁻¹) with **60-s epochs**. A valid day required ≥ 10 h wear; participants needed ≥ 4 valid days including ≥ 1 weekend day. MVPA minutes were binned as **morning 06:00–11:59**, **afternoon 12:00–17:59**, and **evening 18:00–23:59**. Participants were classified as morning/afternoon/evening-dominant if **>50%** of total MVPA occurred in that window; **no-dominant** served as reference. ECW% was assessed by bioelectrical impedance analysis (Tanita 780 MA). Multiple linear regression adjusted for age, sex, marital and living status, education, occupation, and **body-fat percentage**.

Results: The model was significant ($R = .531$; $R^2 = .281$; **adjusted $R^2 = .237$** ; $F(10,161) = 6.306$; $p < .001$). Compared with the no-dominant group, **morning-dominant** MVPA was associated with **lower ECW%** ($B = -1.226$ percentage points; **95% CI $-2.048, -0.405$** ; $p = .004$). Afternoon ($B = -0.330$; $p = .440$) and evening ($B = -0.229$; $p = .690$) groups did not differ. **Body-fat percentage** was positively associated with ECW% ($B = 0.119$; $p < .001$).

Conclusion: Allocating >50% of daily MVPA to the morning is associated with lower ECW% independent of sociodemographic factors and adiposity. Given the cross-sectional design and potential residual confounding, prospective and experimental studies should test causality, dose-response, and mechanisms. If confirmed, chrono-activity prescriptions may provide a novel, low-cost lever to improve cellular hydration and healthy ageing at scale.

SO.1.04-04

Frailty and Dietary Status of Older Adults Differ by Centrality in a Network Established by Community Activities at a Community Center in Japan

S. Nagao-Sato¹, D. Higuchi², R. Akamatsu³

¹Shizuoka Graduate University of Public Health, Shizuoka, Japan, ²Takasaki University of Health and Welfare, Takasaki, Japan, ³Ochanomizu University, Tokyo, Japan

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The social networks of older adults, which are built through various community activities, are effective in promoting healthy behaviors. However, previous studies have reported distinct patterns in older adults' participation in community activities, suggesting that the connections within their social networks are also diverse. This study aims to evaluate the differences in frailty and dietary status by centrality in a network established by community activities at a Japanese community center among older adults.

Methods: Through May to July 2025, we conducted a survey at one community meeting place (A) and one public community center (B) in Takasaki City, Japan. Participants in community activities at each site were asked to complete a self-administered anonymous questionnaire. The questionnaire included demographic characteristics (age, gender, employment status, medical conditions, and household size), frailty score, and three diet-related items: community activities they participated in at the site, healthy eating literacy (HEL), dietary variety score (DVS), and the number of days per week they consumed two or more meals consisting of a staple, main, and side dish (SMS meals). Using the data on community activity participation, we conducted a network analysis and calculated individual eigenvector centrality, which higher score indicates higher centrality. Correlations between the centrality and diet-related variables or frailty score were examined using Kendall's tau-b.

SHORT ORALS

Results: We analyzed responses from 63 participants at site A (median age: 77 years, 31.7% male) and 305 participants at site E (median age: 73 years, 22.3% male). The median eigenvector centrality values (25th, 75th percentiles) were 0.149 (0.133, 0.220) at C and 0.944 (0.944, 0.947) at B. At site A, no correlations were observed between eigenvector centrality and the health-related indicators (range of r : -0.11 to 0.08), whereas small effects were observed for DVS ($r = 0.19$) and SMS meals frequency ($r = 0.16$) at site B.

Conclusion: These findings support that the correlations between positions in a network and health-related variables differed by place. In one place, centrality in a network were associated with food-related indicators. Future research should include additional places and increase the number of participants within each place.

SO.1.04-05

Self-report and Device-measured Sedentary Behaviour and their Associations with Cognitive Functioning: A Cross-sectional Study from LBC1936 Cohort

Z. Yang¹, J. Moodie², P. Dall³, M. Thomis¹, S. Chastin^{3,4}, D. Skelton⁵, T. Russ^{2,6,7}, I. Deary², S. Cox², J. van Uffelen^{1,8}

¹KU Leuven, Department of Movement Sciences, Leuven, Belgium, ²University of Edinburgh, Lothian Birth Cohorts, Department of Psychology, Edinburgh, United Kingdom, ³Glasgow Caledonian University, Research Centre for Health (ReaCH), School of Health and Life Sciences, Glasgow, United Kingdom, ⁴Ghent University, Department of Movement and Sports Sciences, Faculty of Medicine and Health Science, Ghent, Belgium, ⁵Glasgow Caledonian University, School of Health and Life Sciences, Glasgow, United Kingdom, ⁶University of Edinburgh, Division of Psychiatry, Centre for Clinical Brain Sciences, Edinburgh, United Kingdom, ⁷University of Edinburgh, Alzheimer Scotland Dementia Research Centre, Edinburgh, United Kingdom, ⁸KU Leuven, Leuven Brain Institute, Leuven, Belgium

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Research examining sedentary behaviour (SB) and its associations with health in older adults commonly uses either self-report or device-based measures. However, these measures often yield discrepant estimates of SB levels, which may contribute to inconsistent associations between SB and health. This study aims to examine and compare cross-sectional associations between self-report and device-measured SB and cognitive functioning among older adults.

Methods: The sample included 254 participants (78.9±0.4 years old, 52% males) from Wave 4 of Lothian Birth Cohort 1936. Participants completed 13 cognitive tests assessing general cognitive functioning, crystallised ability, visuospatial ability, verbal memory, and processing speed expressed in z-scores. Total sitting time (TST) per day was assessed using a paper-and-pencil questionnaire (7 days average) and a seven-day thigh worn activPAL accelerometer. Associations between TST and cognitive functioning were assessed with linear regression with different levels of adjustment: Model 1: self-report or device-measured TST; Model 2: Model 1, adjusted for age, sex, and marital status; Model 3: Model 2, adjusted for physical activity, BMI, self-rated health, and depression. False discovery rate (FDR) correction was applied to control for multiple comparisons.

Results: Mean (SD) was 390.2 (149.1) and 625.3 (109.5) minutes per day for self-report and device-measured TST respectively. Longer self-report TST was significantly associated with better general cognitive functioning and across all four cognitive domains in all three models. In Model 3, longer self-report TST was significantly associated with greater general cognitive functioning (Unstandardised Beta [B]=0.193, 95%CI: 0.066-0.320, $p=0.003$), crystallised ability ($B=0.326$, 95%CI: 0.108-0.544, $p=0.004$), visuospatial ability ($B=0.262$, 95%CI: 0.108-0.416, $p=0.001$), verbal memory ($B=0.298$, 95%CI: 0.093-0.503, $p=0.005$), and processing speed ($B=0.205$, 95%CI: 0.028-0.382, $p=0.024$). Device-measured TST was not significantly associated with any cognitive domain across all three models.

Conclusion: Among Scottish older adults, self-report SB was associated with general and domain-specific cognitive functioning, whereas device-measured SB was not. Caution is warranted when interpreting findings across measurement approaches, as discrepancies between self-report and device-measured SB may arise from cognitively patterned, heteroscedastic, and scale-dependent biases, thereby undermining reliability and potentially distorting conclusions, interventions, and policy development related to healthy ageing.

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The main aim of this study is to examine the association between cardiorespiratory fitness (CRF), assessed through the 6-minute walk test (6MWT) and peak oxygen uptake (VO₂peak), and cerebral blood flow (CBF), both globally and in specific regions of interest, in older adults with and without coronary artery disease (CAD). We hypothesize that this association will be stronger among individuals with CAD. This research is cutting-edge as it explores the relationship between CRF and CBF in populations at risk of dementia and cognitive decline.

Methods: 79 older adults from the AGUEDA trial and 84 individuals with CAD from the Heart-Brain trial were included in this cross-sectional analysis. Participants underwent 6MWT and a 3D arterial spin labelling magnetic resonance imaging scan. In the Heart-Brain project, the participants conducted additionally a cardiopulmonary exercise test and VO₂peak was determined.

Results: Linear regression models showed that greater CRF was associated with higher CBF in the global gray matter [6MWT: 0.26(0.01; 0.50), p=0.04; VO₂peak: 0.33(0.07; 0.58), p=0.02], the posterior cingulate cortex [6MWT: 0.26(0.01; 0.50), p=0.04; VO₂peak: 0.31(0.05; 0.57), p = 0.02], the anterior cingulate cortex [6MWT: 0.29(0.05; 0.54), p=0.02], the precuneus [6MWT: 0.28(0.04; 0.51), p=0.02; VO₂peak: 0.32(0.07; 0.58), p = 0.01] and the hippocampus [VO₂peak: 0.29(0.02; 0.55), p=0.03] in the Heart-Brain sample, but not in the AGUEDA sample (all p > 0.05), when adjusting for age, sex, education, mean arterial pressure and APOEε4 carrier status. When adding BMI to the model, associations became not statistically significant in both samples. The association between VO₂peak and CBF was significantly mediated (i.e. indirect effect) by BMI (β=0.250, p=0.013).

Conclusion: CRF, was positively associated with CBF in individuals with CAD, but not in older adults without CAD. However, this association was partially explained and mediated by BMI, suggesting that fitter individuals with CAD have better brain perfusion, but due to the fact that they have a lower BMI. Further studies are warranted to clarify the role of CRF and BMI in relation to CBF, the mechanisms involved and the implications for dementia risk prevention.

SO.1.04-07

Socioeconomic Status and Cognitive Function in Later Life: Examining 24-H Time-use Composition as a Potential Mediator

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Socioeconomic status (SES) is linked to cognitive function in later life, though underlying mechanisms remain unclear. 24-h time-use is associated with both SES and cognition. However, whether 24-h time-use statistically mediates the SES-cognition associations has not been investigated.

Methods: Baseline data from 589 cognitively unimpaired older adults (mean age 69.8 ± 3.7 years; 70.5% female) enrolled in the Investigating Gains in Neurocognition in an Intervention Trial of Exercise (IGNITE) study collected across three U.S. sites. Multiple dimensions of SES were used, including area-level SES (Area Deprivation Index), subjective SES, and a latent objective SES measure based on the MacArthur Socioeconomic Status Index. Time use was measured using wrist-worn accelerometers and classified as either sleep, SB, light PA, or moderate-to-vigorous PA (MVPA). Cognitive performance in five domains (executive function (EF)/attentional control, episodic memory, processing speed, visuospatial function, working memory) were used as dependent variables. Compositional mediation analysis using a structural equation modelling framework was used to investigate the potential mediating role of time-use composition in the relationship between SES and cognitive function. Age, sex, site, and race/ethnicity were used as covariates in all analyses.

Results: Higher objective SES was associated with better performance across all cognitive domains (standardised total effects: $\beta = 0.14-0.26$). 24-h time-use, driven mainly by time spent in MVPA, was a significant mediator of this relationship for processing speed, working memory and EF/attentional control (standardised indirect effects: $\beta = 0.015-0.018$); however, relationship was modest. Subjective SES showed similar, but weaker, total effect, with non-significant indirect pathways via 24-h time-use. Area-level SES demonstrated a significant indirect effect through time use for processing speed, working memory and EF/attentional control that was of similar to that observed for objective SES (standardised indirect effects: $\beta = 0.019-0.024$). However, the total effect was smaller and not statistically significance.

Conclusion: Daily time use, particularly time spent in MVPA, partly explains SES-related disparities in cognitive performance amongst older adults. However, the strength of these relationships differs depending on the marker of SES and cognitive domain. This study provides evidence that time spent in daily MVPA could meaningfully contribute to narrowing cognitive gaps linked to socioeconomic disadvantage.

SO.1.04-09

Co-creating an Intergenerational Intervention to Enhance Physical Activity in the Older Adult Population: A Qualitative Study of the Engage Project

X. Paredes Vargas¹, R. Trull¹, J. Solà¹, A. Fort-Vanmeerhaeghe¹, L. Martin¹, J. Jerez-Roig^{2,3,4}, I. Capellà⁵, G. Cardon⁶, M. Giné-Garriga^{1,7}

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Older adults are the most sedentary segment of the population, and effective, sustainable interventions are needed to modify these behaviours. Intergenerational and participatory approaches may enhance adherence and help sustain benefits over time. The primary purpose of this study was to co-create an intergenerational intervention to promote physical activity (PA) and social interaction among older adults, focusing on supporting functional independence. A secondary aim was to explore the potential role of immersive virtual reality (VR) projections as a complementary element to increase motivation and engagement during PA sessions. This research is innovative in combining co-creation and intergenerational participation within a community-based setting, integrating immersive technology as an engaging tool to support behavioural change.

Methods: A mixed-methods design was applied, guided by the Health CASCADE framework and the Behaviour Change Wheel (BCW). The intervention was co-created with older adults, children, teachers, professionals, and policymakers. Qualitative components included expert interviews, workshops with older adults and children, and an advisory board workshop, with data analysed thematically to identify key needs and preferences. In the quantitative phase, an online survey among older adults assessed acceptability, feasibility, and interest in participation, and descriptive analyses were conducted to summarise responses.

SHORT ORALS

Results: Four themes informed the intervention: (1) building on prior technology experiences; (2) designing with empathy to ensure safety, enjoyment, and adaptability; (3) valuing intergenerational engagement; and (4) aligning with older adults' priorities. Workshops with 26 older adults (84.1 ± 7.6 years) and 19 children (11.5 ± 2.9 years) highlighted shared preference for outdoor activities. Findings were translated into an intervention proposal during the advisory board workshop. Survey results from 53 older adults showed that 67.9% were willing to participate, reflecting high acceptability and perceived relevance of the programme.

Conclusion: Co-creation is a feasible approach to developing inclusive intergenerational PA interventions. Outdoor activities were widely preferred, and while VR shows motivational potential, its use should emphasize accessibility, user acceptance, and gradual integration.

SO.1.04-10

Eating and Aging: Assessing the Impact of Social versus Solitary Eating on Diet Quality in Older Adults Living in Community

S. Bergstedt¹, H. Ninow², A. Crusan¹

¹St. Catherine University, Department of Nutrition and Dietetics, St. Paul, United States, ²St. Catherine University, Department of Occupational Therapy, St. Paul, United States

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors

Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: By 2030, a 56% increase in individuals aged sixty years and older is expected compared to 2015. Despite this increase, dietary interventions are failing to support increased healthspan. Namely, 41% of community-dwelling older adults are reported to have or be at risk for malnutrition. This research aims to examine the factors that impact the nutritional quality of older adults, with a focus on solitary versus social eating environments.

Methods: This mixed-methods project used hybrid thematic analysis. Individual, semi-structured interviews were conducted with 15 participants, aged 65 years or older, living in a community setting and using on-site food services (female = 94%). Deductive coding for thematic analysis was supported by the National Institute on Aging Health Disparities Framework. Three interprofessional team members independently coded the interviews; a final codebook was created using inductive codes. Additionally, all participants completed the Dietary Quality Questionnaire (DQQ) for quantitative analysis of diet quality.

Results: Of the participants, 42.9% reported eating more in a social eating environment ($n = 6$), while 73.3% reported eating two or more meals a day alone ($n = 11$). Participants (average age = 78.8 ± 8.4) had an average DQQ Dietary Diversity Score of 7.2 ± 1.4 , compared to the national average of 6.5 (target is >5), indicating higher diversity. A Global Dietary Recommendations Score of 11.9 ± 2.2 , compared to the national average of 9.7 (out of 18), also supported a higher-than-average dietary quality in this cohort. Thematic analysis showed four main themes impacting diet quality with additional subthemes (1) environmental (transport, education, income, kitchen access), (2) sociocultural (view of aging, food labeling, social network, self-concept, loneliness), (3) behavioral (health behavioral, energy conservation), (4) biological (co-morbidities, effect of aging processes on food choice). Strengths derived from these themes are reflected in higher DQQ scores.

Conclusion: This project provided insights into the factors affecting diet quality in highly educated, older adults living in the community, with environmental, sociocultural, behavioral, and biological factors all playing a significant role in determining diet quality. Interventions targeting the themes and subthemes are needed to increase healthspan in an ever-aging population.

SO.1.04-11

Identifying Aerobic-fitness Responses to Aerobic Exercise in Alzheimer's Disease to Tailor Adaptive Interventions

F. Yu¹, M. Todd¹, M. Maxfield¹, J. Rodney¹, J. Pruzin², Y. Su², D. Li³, D. Coon¹

¹Arizona State University, Phoenix, United States, ²Banner Alzheimer's Institute, Phoenix, United States, ³University of Minnesota, Minneapolis, United States

SHORT ORALS

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Improvements in cardiorespiratory fitness following moderate-intensity continuous aerobic training (MICT) are well-documented but show variability across individuals. This heterogeneity among older adults may contribute to inconsistent findings regarding the effects of MICT on cognition in individuals with Alzheimer's disease (AD).

Methods: This study will examine the feasibility of using aerobic fitness, as measured by peak oxygen consumption (VO₂peak) through a symptom-limited cycle-ergometer test, to identify non-responders to MICT and adapt exercises from the FIT-AD Sequential, Multiple Assignment, Randomized Trial (SMART). FIT-AD SMART aims to enroll 108 older adults with early AD, assigning 72 to MICT and 36 to stretching exercises for six months. After three months, VO₂peak is reassessed to identify non-responses, defined as <5% improvement in VO₂peak from baseline. Non-responders are re-randomized to either high-intensity interval training or a combined aerobic and resistance exercise program, while responders continue with MICT for another three months.

Results: Among 19 participants who passed the 3-month assessment period, they were 70.95±5.75 years of age, had 16.05±2.74 years of education, and scored 22.74±3.51 on the Montreal Cognitive Assessment (MoCA). About 57.1% of the participants were female, and 28.6% were Hispanic. Their VO₂peak averaged 18.72±4.75 mL/kg/min at baseline and 21.73±6.91 mL/kg/min at three months, representing a mean improvement of 6.93%±10.43%. Among the 19 participants, 13 were randomized to MICT and 11 completed 3-month exercise testing. The 11 MICT participants' VO₂peak was 19.05 mL/kg/min at baseline and 20.40 mL/kg/min at 3 months, representing a 15.2% increase. Six of the MICT participants were classified as non-responders (VO₂peak change: -2.96%±8.85%), and five were responders (VO₂peak change: 36.9%±51.9%). In contrast, VO₂peak of the stretching group (n=6) decreased 6.2%.

Conclusion: The findings indicate that VO₂peak did not improve among half of participants assigned to MICT following 3-months of training, although the amount of improvement was considerable among responders. These findings underscore the importance of using VO₂peak as a key physiological marker for identifying exercise non-response in older adults with AD early during exercise interventions. Subsequent tailoring of exercise interventions following non-response to MICT may help maximize the benefits of aerobic exercise on cognitive health.

SO.1.04-12

Evolving Engagement: A Longitudinal Qualitative Study of Physical Activity and Social Connectedness in Older Adults

R. Tadrous^{1,2}, V.J. Palmer¹, M. Wang¹, J.R. Olsen^{3,1}, M. Anderson¹, B.P. Rigby^{4,1}, M. Thomson¹, R. Lewis¹, K. Mitchell¹, E. Long¹, K. Skivington¹, S.A. Simpson¹

¹University of Glasgow, School of Health and Wellbeing, Glasgow, United Kingdom, ²King's College London, Better Health & Care Hub, London, United Kingdom, ³The University of Queensland, Institute for Social Science Research, Brisbane, Australia, ⁴University of Newcastle, Population Health Sciences Institute, Newcastle upon Tyne, United Kingdom

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Physical activity (PA) and social connectedness are central to healthy ageing, yet older adults often experience transitions such as retirement, shifting caregiving roles, bereavement, or health changes that disrupt routines. Adaptation to these transitions shapes the ability to remain active and socially engaged, particularly in socioeconomically disadvantaged communities where structural constraints amplify vulnerability. This study provides one of the first longitudinal qualitative examinations of how PA and social connectedness evolve through such transitions among older adults in deprived settings. It aimed to identify behavioural trajectory typologies and examine mechanisms that support or undermine sustained engagement.

Methods: A qualitative longitudinal study was conducted with mid-older adults in two socioeconomically deprived Scottish local authorities. Semi-structured interviews were completed at three timepoints between December 2022 and October 2024 (T1: n=27, T2: n=22, T3: n=16, and n=4 combined T2–T3 interviews). Participants (mean age 64.7 ± 5.5 years) described their social networks, PA practices, life transitions, and neighbourhood environments. Interviews were supported by maps of participants' local areas and social network diagramming to explore relational and spatial influences. Analysis combined inductive and deductive coding informed by the Socio-Ecological Model and COM-B. Longitudinal Synchronic Framework Analysis captured within- and between-person change over time.

Results: Five trajectories were identified. Sustained engagers maintained stable participation, supported by resilience, flexible identities, routines, strong social networks, and accessible environments. Gradual disengagers experienced slow reductions in PA and social contact due to cumulative health, social, and environmental challenges

SHORT ORALS

despite intentions to remain active. Increasers/late-life adopters expanded engagement following transitions such as retirement or changes in caregiving, supported by family, friends, and community resources. Fluctuating engagers experienced intermittent engagement shaped by variable health, caregiving responsibilities, or seasonal and environmental limitations. Persistent strugglers faced longstanding constraints including poor health, mobility limitations, shrinking social networks, and inaccessible environments, with disengagement shaped more by structural barriers than preference.

Conclusion: These trajectories highlight the dynamic and context-dependent nature of engagement in later life. Identifying characteristics that underpin resilience, such as flexible social identities, local social infrastructure, and supportive social ties, can inform multi-level interventions that are contextually grounded and adopt life-course approaches to active ageing, particularly within disadvantaged communities.

SO.1.04-13

Examining the Association between Social Support and Physical Activity in Rural-dwelling Older Adults: An Analysis of the Canadian Longitudinal Study of Aging

K. Ward¹, C. Pelletier¹, D. Banner², T. Manyanga³, D. Mackey⁴

¹University of Northern British Columbia, Health Sciences, Prince George, Canada, ²University of Northern British Columbia, Nursing, Prince George, Canada, ³University of Northern British Columbia, Medical Sciences, Prince George, Canada, ⁴Simon Fraser University, Biomedical Physiology and Kinesiology, Burnaby, Canada

SO.1.04 Ageing: The Ageing Mind in Context: Integrating Biological, Social, and Environmental Factors
Room 3, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Approximately one in five older adults in Canada lives in rural communities and reports poorer health than their urban counterparts. Social support and physical activity are key modifiable determinants of health, associated with improved physical, cognitive, and psychosocial health outcomes. This cross-sectional study investigated the association between social support and physical activity among Canadian adults aged 65 years and older residing in rural areas.

Methods: Data were from the Canadian Longitudinal Study of Aging (CLSA), a national health study that tracks participants aged 45–85 years at recruitment for 20 years. We analyzed data from participants aged 65 years and older, living in rural communities, to examine the association between social support and physical activity. Social support was assessed using the Medical Outcomes Survey (MOS), and physical activity was assessed using the Physical Activity Scale for the Elderly (PASE). Covariates included age, education, self-reported health status, body mass index, retirement status, smoking, alcohol use, years living in their community, living arrangements, marital status, sex, gender identity, and household income. Multivariable linear regression with model-building procedures was used to examine associations between social support and physical activity, adjusting for key covariates.

Results: Of the 2,766 adults in our sample, the majority were female (52.6%), completely retired (55.4%), and considered their health to be good or very good (68.1%). On average, participants reported strong overall social support ($M = 83.96$, $SD = 17.08$) and moderate levels of physical activity ($M = 122.65$, $SD = 60.35$) compared to norms for community-dwelling older adult populations. Social support had a weak association with physical activity ($r^2 = .006$, $F\text{-value} = 11.930$, $p < .001$). The fully adjusted model to predict physical activity included social support, age, sex, retirement status, and general health and explained 22% of the variance ($F\text{-value of } 80.10$ ($p < .001$)) in physical activity.

Conclusion: While the association between social support and physical activity was weak, several demographic variables (i.e., age, sex, retirement status, general health) accounted for significant variance. Interventions targeting rural older adults in Canada should consider these demographic factors and their impact on the association between social support and physical activity.

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based Assessment AI and Smart Tools for Movement Tracking
Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Conventional accelerometer metrics (e.g., step counts or UK Biobank-derived walking measures) don't reliably distinguish intentional walking sessions (structured exercise) from habitual ambulation. We aimed to design and implement a heuristic algorithm to detect intentional walking sessions in wrist accelerometry evaluations.

Methods: Fifty overweight/obese older adults (70.2 ± 3.8 years) in Benalmádena, Spain wore wrist accelerometers (GENEActiv) for 7–10 days. Variables included cadence (steps/sec), ENMO (milligravitational units, mg) and moderate-vigorous physical activity (MVPA). Data were collected in May 2020 during the easing of COVID-19 restrictions. Temporarily imposed time slots regulating outdoor mobility facilitated structured outdoor exercise routines. Participants reported walks (days and times), which two experts visually verified in the accelerometer data. The first two confirmed walks per participant were used to develop the algorithm. A *walking set* was defined as a bout with ≥3 min with ≥0.1 steps/sec for ≥90% of the bout. Walking sets were merged if interruptions <2 min. A second merge applied when interruptions were <25% of the combined bout duration. Merging was repeated iteratively. A *walking session* was defined as the final outcome of this merging process. The algorithm was then applied to all evaluated days to verify the detection of reported and nonreported walks.

Results: Walking sessions were confirmed in 31 participants. The algorithm identified 100% of expert-confirmed walks and 36 additional unreported walks. 70 walks were detected among non-reporters (347 sessions in total). Men performed 204 (58.8%) of the total walking sessions.

The walking sessions had a mean duration of 36.1 ± 27.7 min (men 35.2 ± 27.8; women 37.3 ± 27.5); mean intensity 116.0 ± 62.0 mg (men 130.3 ± 71.6; women 95.5 ± 36.2; $p < 0.001$). Sessions comprised 2.3 ± 1.4 walking sets, which represented 90.3% of session duration (32.6 ± 23.4 min) with an intensity of 120.6 ± 62.9 mg. MVPA accounted for 62.4% (22.5 ± 23.3 min) of the total duration of the walking sessions.

Conclusion: The heuristic algorithm accurately identifies intentional walking sessions from wrist accelerometry in older adults, revealing unreported exercise and enabling objective characterization of the duration and intensity. Its application may improve the quantification of walking exercise in epidemiological and intervention studies.

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based Assessment AI and Smart Tools for Movement Tracking
Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Workplace productivity is influenced by behavioral and physiological factors, including physical activity, sleep, and sedentary behavior. Understanding how 24-hour activity patterns influence workability could provide insights for optimizing productivity and recovery.

Methods: We conducted a 15-day Ambulatory Assessment with 203 adults (56.2% female; mean age=35.8). Physical

SHORT ORALS

activity, sedentary bouts, and sleep quality were captured via accelerometers and daily e-diaries. Workability and sleep quality were assessed through smartphone-based prompts. Multilevel modeling was applied to examine within-person associations, with exploratory moderation analyses on workplace settings (remote vs on-site).

Results: Sleep quality was positively associated with daily workability ($\beta=0.007$, $p<.001$). Higher step counts were linked to higher ratings of workability ($\beta=1.78$, $p=.004$), while sedentary bouts ($>40\text{min}$) showed no significant relationship. Exploratory interaction analyses indicated that the workplace setting moderated the relationship between sleep quality and workability.

Conclusion: The findings suggest that both higher ratings of sleep quality and daily step counts contribute to better self-perceived workability, reinforcing the importance of maintaining active and well-rested lifestyles. Consequently, workplace policies supporting regular physical activity and sufficient sleep could potentially enhance employee well-being and productivity in different work settings.

SO.1.05-03

Continuous versus Fragmented Intense Physical Activity and Mortality Risk: A Prospective US-based Population Study

F. Schwendinger¹

¹University of Basel, Department of Sport, Exercise and Health, Basel, Switzerland

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based Assessment AI and Smart Tools for Movement Tracking
Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This study investigated how the associations of the intensities of the most active 1-60 minutes of the day and all-cause and cause-specific mortality are moderated by the fragmentation of physical activity (PA) in US adults.

Methods: Data from adults aged >19 years in the National Health and Nutrition Examination Survey 2011-2014 were analysed. Wrist-worn accelerometers measured PA over seven days. Intensity was quantified as the most active continuous (MX_{CONT}) and accumulated (MX) 1, 5, 10, 15, 20, and 60 minutes of the day and their ratio ($MX_{\text{RATIO}} = MX_{\text{CONT}} / MX$). Outcomes included all-cause (766 events), cardiovascular disease (231 events), and cancer (192 events) mortality. Survey-weighted Cox proportional hazard models were used including restricted interactions between MX_{CONT} and MX_{RATIO} . Hazard ratios (HR) and 95% confidence intervals (CI) are reported for 400 milli-gravitational units (fast walking) relative to 100 milli-gravitational units (slow walking), except for the 60-minute duration, where 200 milli-gravitational units (brisk walking) were used.

Results: Among 8,426 adults (52% women), the median follow-up was 81 months (interquartile range: 69, 94).

For all-cause mortality, continuous moderate-intensity PA for 10-60 minutes was associated with lower mortality risk compared to more fragmented PA. Fragmentation showed little influence for shorter durations (<5 minutes) of vigorous-intensity PA.

For cardiovascular mortality, sporadic vigorous-intensity PA for up to the most active 5 minutes appeared to be more strongly associated than continuous PA, though uncertainty was greater for sporadic patterns. There was little evidence of an interaction with fragmentation for the most active 10 minutes. For 20-minute ($HR_{\text{continuous}}=0.15$, 95% CI:0.04-0.49 vs $HR_{\text{sporadic}}=0.24$, 95% CI:0.04-1.31) and 60-minute durations ($HR_{\text{continuous}}=0.09$, 95% CI:0.03-0.27 vs $HR_{\text{sporadic}}=0.39$, 95% CI:0.10-1.59), continuous moderate-intensity PA showed stronger associations than those of sporadic PA.

For cancer mortality, moderate-to-vigorous-intensity PA accumulated continuously was associated with lower risk than sporadic PA across all durations, i.e. 5 minutes ($HR_{\text{continuous}}=0.06$, 95% CI:0.01-0.37 vs $HR_{\text{sporadic}}=2.43$, 95% CI:0.65-9.11) and 20 minutes ($HR_{\text{continuous}}=0.02$, 95% CI:0.00-0.24 vs $HR_{\text{sporadic}}=0.85$, 95% CI:0.20-3.62).

Conclusion: Associations between PA intensity and all-cause and cause-specific mortality appear to differ according to the degree of PA fragmentation. Patterns characterised by shorter, vigorous-intensity PA and longer, moderate-intensity PA were associated with more favourable mortality outcomes.

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based Assessment AI and Smart Tools for Movement Tracking
Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This study examined parental acceptability and preliminary effectiveness of the *Active Family* mHealth intervention on the physical activity (PA) levels and sedentary time (ST) of parents and their young children (aged 3-4 years). The study contributes to understanding how micro-interventions can promote real-time parent-child co-activity in everyday life.

Methods: Employing a just-in-time micro-randomized controlled trial design, the parents from 25 parent-child dyads received seven daily text message prompts for 14 days. Each prompt included a short questionnaire to assess availability for PA and to tailor the micro-intervention messaging. When available, parents were randomized to receive a micro-intervention (contextually tailored PA suggestion) or a control (no suggestion). Throughout the trial, dyads wore ActiGraph accelerometers to measure ST, light PA (LPA), and moderate-to-vigorous PA (MVPA). After the trial, parents completed an online acceptability questionnaire. A centred and weighted least square regression was used to analyze the effect of PA suggestions on the proximal 60-minute ST, LPA, and MVPA of parents and children following each prompt. Descriptive statistics and content analysis were used to analyze acceptability questionnaire responses.

Results: The *Active Family* mHealth micro-interventions were not found to be effective at changing children's or parents' proximal ST ($p = .878$; $p = .485$), LPA ($p = .714$, $p = .729$) or MVPA ($p = .511$, $p = .480$), respectively. However, micro-interventions became more effective at increasing parental MVPA in the second week of the intervention ($b = 0.47$, $95\%CI = 0.12, 0.83$, $p = .013$). For children, the intervention effectiveness varied by contextual factors (e.g., weather conditions). Overall parents reported that the intervention was largely acceptable, appropriate, and feasible for their families; however, provided suggestions for improvement, including customized prompt schedules and context specific PA ideas.

Conclusion: While the PA micro-interventions did not lead to significant change in PA or ST, findings indicate a potential for increasing parental PA over time and enhancing child PA under specific conditions. This study contributes to growing, albeit limited, evidence on the feasibility of mHealth interventions to promote PA in early childhood, particularly through scalable, low-cost digital health strategies targeting families.

SO.1.05-05

Beyond Cut-points: Deep Learning for Physical Behaviour Measurement From Multi-wear-Site Accelerometers among Preschoolers

Z. Wu¹, B.T. Tam^{1,2}, F. Sun³, E.L. Zhang^{4,5}, W.Y. Huang^{1,2}

¹Hong Kong Baptist University, Department of Sports and Health Sciences, Kowloon Tong, Hong Kong, SAR of China,

²Hong Kong Baptist University, Dr. Stephen Hui Research Centre for Physical Recreation and Wellness, Kowloon Tong, Hong Kong, SAR of China, ³Hong Kong Baptist University, Department of Health and Physical Education, Kowloon Tong, Hong Kong, SAR of China, ⁴Hong Kong Baptist University, Department of Computer Science, Kowloon Tong, Hong Kong, SAR of China, ⁵Hong Kong Baptist University, Institute for Research and Continuing Education, Kowloon Tong, Hong Kong, SAR of China

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based Assessment AI and Smart Tools for Movement Tracking
Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This study aims to develop and validate Long Short-Term Memory (LSTM) deep learning (DL) models for classifying physical behaviour in preschoolers and compare them with validated cut-point methods; and to evaluate

SHORT ORALS

model performance between wrist, thigh, and combined wrist-and-thigh placements using video observation as ground truth.

Methods: A total of 79 preschoolers (3.0 - 5.5 years; 50% male) wore a thigh-worn Fibion SENS (Fibion Inc., Jyväskylä, Finland) and a wrist-worn ActiGraph GT3X+ (ActiGraph, Florida, USA) during a 2-hour free-living session and a 20-minute semi-structured session within a kindergarten. All sessions were video recorded. Videos were annotated and cross-validated by independent raters, using the Children's Activity Rating Scale. Activity intensity was categorised as sedentary behaviour (SB), light physical activity (LPA) and moderate-to-vigorous physical activity (MVPA). LSTM-based models were trained on raw triaxial acceleration and device orientation, with participants' characteristics as additional inputs. Performance was evaluated via 10-fold cross-validation. Cohen's weighted kappa (κ) quantified agreement across overall categories, and per-category unweighted kappa quantified category-specific agreement; 95% confidence intervals (CI) were reported.

Results: Across 157.4 hours of labelled data, DL models outperformed cut-point methods at both placements for overall category agreement (κ): thigh DL = 0.940 (95% CI: 0.935-0.944) versus thigh cut-points = 0.768 (95% CI: 0.602-0.897); wrist DL = 0.743 (95% CI: 0.730-0.757) versus wrist cut-points = 0.424 (95% CI: 0.408-0.442). The combined wrist-and-thigh DL model achieved similar overall agreement (κ = 0.945, [95% CI: 0.942-0.949]) as thigh DL. Category-specific agreement (κ) for the combined model was 0.977-0.986 (SB), 0.813-0.836 (LPA), and 0.792-0.834 (MVPA). For the thigh model, κ values were 0.974-0.983 (SB), 0.796-0.824 (LPA), and 0.793-0.840 (MVPA). For the wrist model, κ values were 0.658-0.690 (SB), 0.667-0.697 (LPA), and 0.707-0.768 (MVPA).

Conclusion: Compared with cut-point methods, LSTM-based DL model provides higher agreement for measuring physical behaviours in preschoolers, with absolute increases in weighted kappa of 0.172 and 0.319 on thigh and wrist accelerometers respectively. The combined wrist-and-thigh and thigh DL models show almost perfect agreement for SB and LPA, and substantial-to-almost perfect agreement for MVPA. A thigh-worn accelerometer paired with a DL model is recommended for measuring physical behaviours in preschoolers.

SO.1.05-06

Co-designing Gamified EMA with Children: Improving Engagement and Data Quality in mHealth Research on Movement Behaviors (The ReDiKid Study)

V. Dostálová¹, P. Popelková¹, J. Kühnová², A. Faltysová¹, R. Cimler¹, M. Šaradín Lebedíková³, M. Tkaczyk³, D. Šmahel³, J. Dygrýn⁴, A. Gába⁴, J. Pelclová⁴, T. Vetrovsky¹

¹University of Hradec Králové, Faculty of Science, Center of Advanced Technologies, Hradec Králové, Czech Republic,

²University of Hradec Králové, Faculty of Science, Department of Mathematics, Hradec Králové, Czech Republic, ³Masaryk University, Faculty of Social Studies, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic,

⁴Palacký University Olomouc, Faculty of Physical Culture, Olomouc, Czech Republic

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based AssessmentAI and Smart Tools for Movement Tracking

Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: mHealth research on movement behaviors in children presents challenges due to their ongoing cognitive development, often resulting in difficulties with using self-report measures, understanding procedures, and maintaining engagement and compliance. To obtain accurate, valid, and reliable data in mHealth studies involving children, it is essential to adapt the study design to suit their developmental and motivational needs. The ReDiKid study demonstrates how a user-centered approach in the Ecological Momentary Assessment (EMA) study design can effectively address these challenges.

Methods: To adapt the design of our EMA study for children aged 9 to 11 years, we implemented a two-phase participatory design. First, children helped redesign our EMA survey app, HealthReact, for their use. In focus groups, children suggested gamification elements to make the app more engaging, and then assessed proposed modifications (Group 1: n = 4, 3 girls, mean age 9.2; Group 2: n = 6, 2 girls, mean age 9.6). Second, the resulting gamified version was validated for comprehensibility and appeal through individual interviews (n = 12, 5 girls, mean age 10.1). Additionally, we conducted cognitive interviews to test specific items on affect, stress, sleep, digital behavior, and physical activity in the gamified version of the app (n = 17, 9 girls, mean age 9.7).

Results: Children perceived rewards and fun as key engagement motives, suggesting implementing gamification elements such as collecting points, badges, streaks, and personalized options (e.g., naming an app mascot). They considered the resulting gamified app appealing and comprehensible, except for the streak logic. In cognitive interviews, children struggled with questions on digital behavior and resilience (particularly with comprehension

SHORT ORALS

and/or retrieval) and also with long lists of response options, preferring numbered Likert scales.

Conclusion: The ReDiKid study demonstrates that involving children in EMA study design is an effective way to adapt the study to suit their developmental and motivational needs. The gamified app, co-designed by children, was perceived as both appealing and comprehensible. Children's involvement also contributed to improved items for EMA study. Although a pilot study is necessary to evaluate other key aspects of EMA study design, the user-centered approach promises to ensure reasonable compliance and data quality.

SO.1.05-07

Not All Screen Time Is Sedentary: Evidence from Objective Smartphone and Accelerometer Data

J. Culverhouse¹, R. Ghosal², O.L. Finnegan¹, G.R. Weaver¹, S. Nelakuditi³, K. Bowen¹, K. Kiely¹, A. Holmes¹, M. Restino¹, T. Adair¹, M. Savidge¹, J.W. White III¹, G.A. Randolph¹, S. Burkart¹, E.L. Adams¹, M.W. Beets¹, B. Armstrong¹

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based AssessmentAI and Smart Tools for Movement Tracking

Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Screen time has historically been used as a proxy for sedentary behavior, originally based on television viewing, a primarily sedentary activity. However, smartphones have diversified what “screen time” represents and can be used when non-sedentary (e.g. standing or walking). Although people with higher smartphone screen time tend to be more sedentary overall, this does not mean that smartphone use itself only occurs during sedentary behavior. Most existing evidence relies on self-report measures prone to recall bias, offering limited insight into when smartphone use and sedentary behavior coincide. This study demonstrates a novel approach to quantifying the overlap between smartphone use and sedentary behavior using objective data and describes the associated movement intensities and app use patterns.

Methods: A convenience sample of 44 parents of preschool-aged children (97% female; mean age 36.7 ± 6.7 years) completed a two-week monitoring protocol. Smartphone use (screen on) was objectively measured using the Chronicle passive-sensing app, and movement behaviors were captured with wrist-worn Axivity AX3 accelerometers. Data streams were time-aligned at 5-second epochs. Accelerometer data were processed in GGIR (v 3.3.0) to estimate non-wear, sleep, and activity intensity. The SedUp algorithm classified sedentary and non-sedentary behavior. Descriptive statistics summarized the smartphone use during sedentary and non-sedentary behaviors, and the activity intensities.

Results: When using a smartphone, 36.5% (range: 22.7-55.2%) of use occurred during non-sedentary behavior. During this non-sedentary use, acceleration intensity was predominantly inactive (64.1%) and light-intensity (28.5%), with a smaller proportion at moderate intensity (7.4%). The most common app categories used during non-sedentary behavior were Games, Social & Communication, and Lifestyle, respectively. This differed from the order in sedentary behavior; Social & Communication, Entertainment, and Games.

Conclusion: Over one third of smartphone use occurred when participants were not sedentary. Smartphone use and sedentary behavior are related but not interchangeable constructs. Replication in a larger sample using posture-sensitive measures could further refine these estimates. Distinguishing sedentary from non-sedentary smartphone use may inform more nuanced and context-aware digital health interventions, such as optimally timing prompts or app-level nudges based on real-time movement and context. These findings underscore the need to reconsider what “screen time” represents today.

SO.1.05-09

Designing Just-in-Time Adaptive Interventions with Commercial Wearables: Opportunities and Challenges

A. Willms¹, S. Liu¹

¹University of Victoria, Victoria, Canada

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based AssessmentAI and Smart Tools for Movement Tracking

Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: To describe current opportunities and challenges in using commercial wearables and no-code platforms to design Just-in-Time Adaptive Interventions (JITAI) for promoting physical activity.

Methods: We designed and piloted a JITAI (*Activeverse*) that delivered tailored daily exercise recommendations based on users' previous-day moderate-to-vigorous physical activity (MVPA), as recorded by the Apple Watch, and their self-reported daily motivation and exercise preferences. The intervention was developed using *Pathverse*, a no-code research platform that enables rapid app creation without programming expertise. Development involved a multidisciplinary team of behavioural scientists, graduate students, and software engineers. The study integrated Apple HealthKit data (active minutes) with daily self-report diaries delivered each morning. Adaptive exercise prompts were triggered when MVPA fell below personalized thresholds or when motivation levels were low. Lessons learned across the design, testing, and deployment phases were summarized through structured monthly meetings.

Results: Key opportunities included rapid prototyping through visual no-code workflows, seamless integration with validated consumer sensors, and the ability to deploy hybrid study designs that combined daily diary data with wearable-based triggers. Maintaining truly "live" adaptivity, however, remains a major challenge. On most mobile platforms, data from consumer wearables can be used to trigger adaptive messages or interventions within a few hours of a behavioural threshold being reached. However, the speed and reliability of these triggers can vary depending on the device and its operating system. For example, iOS devices tend to collect data consistently but limit background activity, which can occasionally delay or prevent triggers from being delivered in real time. When planning studies, researchers should keep in mind factors such as data delays, Bluetooth connectivity, and system-level restrictions. Understanding these constraints early on can help guide more realistic and effective intervention designs.

Conclusion: Commercial wearables and no-code platforms are accelerating the development of JITAI and broadening access for behavioural scientists. However, achieving truly "just-in-time" adaptivity requires addressing interoperability, latency, and background-processing limitations. Stronger collaboration among behavioural researchers, engineers, and device manufacturers is essential to enable scalable, real-time adaptive interventions for physical activity promotion.

SO.1.05-10

Behind the Wheel and Beyond: Physical Activity and Sedentary Time in Occupational Drivers and their Associations with Health Outcomes

A. Zeb¹, A. Neven², A. Timmermans¹, J. Verbrugghe¹, L. Janssens¹, C. Burtin^{1,3}

¹UHasselt - Hasselt University, REVAL Rehabilitation Research Center, Faculty of Rehabilitation Sciences, Diepenbeek, Belgium, ²UHasselt - Hasselt University, Transportation Research Institute (IMOB), Hasselt, Belgium, ³UHasselt - Hasselt University, BIOMED Biomedical Research Institute, Diepenbeek, Belgium

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based AssessmentAI and Smart Tools for Movement Tracking

Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The purpose of this study was to: 1) objectively measure and compare physical activity (PA) and sedentary time between workdays and non-workdays across occupational driver subgroups, namely, long-haul drivers (LHDs), short-haul drivers (SHDs), and local delivery drivers (LDDs), and 2) to explore how PA and sedentary time relate to health outcomes.

Methods: This cross-sectional study was part of the Milestone Study, approved by the Ethical Committee of Antwerp University Hospital (reference number 3126). Dutch-speaking occupational drivers working in Flanders who owned a smartphone were included. PA (steps, light, moderate, and vigorous activity) and sitting time were measured using

SHORT ORALS

the Fitbit Charge 5. Health-related outcomes, including musculoskeletal burden, quality of life, perceived stress, depression, anxiety, stress, sleep quality, daytime sleepiness, and fatigue, were assessed via validated self-report questionnaires administered through Qualtrics. Linear mixed-effects models examined differences in PA and sedentary time between workdays and non-workdays, and across driver subgroups. Multivariate linear regression analyses assessed associations of PA and sedentary time with health outcomes, adjusting for driver type and driving experience.

Results: Thirty-three drivers (43.2 ± 10.7 years; 30 men, three women) participated. Participants engaged in 63 ± 65 minutes of moderate-to-vigorous PA (MVPA), accumulated $10,485 \pm 5,314$ steps/day, and spent 617 ± 194 minutes sitting/day. Steps ($10,937 \pm 4,978$ vs. $9,701 \pm 5,776$; $p = 0.002$) and light PA (310 ± 101 min vs. 253 ± 88 min; $p < 0.001$) were higher on workdays, while vigorous PA (26 ± 41 min vs. 24 ± 32 min; $p = 0.006$) was higher on non-workdays. LHDs were more active on non-workdays, exhibiting higher step counts, MVPA, and less sedentary time, whereas LDDs were more active during workdays, with higher step counts, more light and moderate activity, and less sedentary time. These patterns reflect job differences, as LHDs spend long hours seated while LDDs move frequently during deliveries. No significant associations were found between PA, sedentary time, and health outcomes.

Conclusion: This study offers valuable insights into the activity patterns of the hard-to-reach driver population. The findings highlight the need for targeted interventions that address the distinct movement profiles of each driver subgroup.

SO.1.05-11

A Just-in-Time Adaptive Intervention to Increase Healthy Habits in People Living with Multi-morbidity

J. Sanders¹, W. Zhou², J. Fleming³

¹Loughborough University, School of Sport, Exercise and Health Sciences, Loughborough, United Kingdom,

²Loughborough University, Computer Science, Loughborough, United Kingdom, ³Loughborough University, Wolfson School of Mechanical, Electrical and Manufacturing Engineering, Loughborough, United Kingdom

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based AssessmentAI and Smart Tools for Movement Tracking

Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The growing prevalence of multimorbidity presents major challenges for sustaining health-promoting behaviours such as physical activity. Traditional behaviour change interventions often lack the flexibility to adapt to the contexts of individuals lives. Just-in-Time Adaptive Interventions (JITAI) offer a promising alternative by delivering personalised support “at the right time,” responsive to users’ changing internal states and external environments.

The primary purpose of this study was to evaluate the effect of a JITAI implemented within the Holly Health (HH) mobile app on habit formation among individuals living with multimorbidity. Specifically, we examined whether JITAI-triggered notifications increased

- (1) the completion of healthy habits and
- (2) overall app engagement.

Methods: A JITAI was implemented within the HH app using a model predictive control (MPC) framework with a one-day horizon. At each daily decision point, the system selected one of 15 intervention options (three message types $\times$ five delivery times) to maximise expected habit completions, balancing exploration and exploitation via an ϵ -greedy strategy. Tailoring variables included recent adherence, mood, engagement, perceived impacts, and day type.

A pre-post design was employed in which users engaged with the app for three months before and after JITAI activation. Participants were adults with multimorbidity who had completed onboarding and logged at least one healthy habit during baseline. Primary outcomes were (1) habit ratio (completed/scheduled habits) and (2) new engagements (distinct user-initiated interactions). Negative binomial mixed-effects models, accounting within-individual variability, tested for pre-post differences in outcomes.

Results: Data from 181 users (75% female; 49% > 45 years) were analysed. Compared with the pre-JITAI activation, habit ratio was 10% higher post-JITAI (Incidence Rate Ratio [IRR] = 0.90, $p < 0.001$). App engagement increased by 21% (IRR = 0.79, $p < 0.001$). These effects remained significant after adjusting for individual variability.

Conclusion: Embedding a JITAI within the Holly Health app significantly improved both habit completion and engagement among individuals with multi-morbidity. These findings highlight the potential of adaptive, data-driven digital interventions to enhance sustained behaviour change. Future research will explore the long-term impact of the JITAI beyond three months to assess whether improvements in engagement and habit formation are maintained over time.

SO.1.05-12

Comparison of Physical Activity Estimation Performance between Wear Locations Using a Random Forest Classifier

N. Remillard¹, H. Hilafu², S. Crouter¹

¹University of Tennessee Knoxville, Kinesiology, Recreation, and Sport Studies, Knoxville, United States, ²University of Tennessee Knoxville, Haslam College of Business, Knoxville, United States

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based Assessment AI and Smart Tools for Movement Tracking

Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Currently, there is no consensus on a single wear-site recommendation for predicting activity type and energy expenditure (EE) estimation using wearable devices. Few studies have compared activity classification and EE estimation performance across wear locations using a dataset inclusive of multiple types of activities. The purpose of this analysis was to compare activity classification and EE estimation performance between wrist, hip, and ankle wear locations using a random forest (RF) classifier utilizing a comprehensive dataset.

Methods: Forty-one participants (21 males; mean±sd, age: 33.6±13.5 yrs, body mass index: 24.8±3.4 kg/m²) completed a semi-structured protocol consisting of twenty activities, ranging from sedentary to vigorous intensities. The start and stop times of each activity were annotated in real time. Participants wore a portable indirect calorimeter (Cosmed K5) and five ActiGraph GT9X devices (right/left wrists (RW/LW) and ankles (RA/LA), right hip). Temporal features were calculated from 100Hz triaxial accelerometer and gyroscope data. Five RF models, one per location, were trained on 15-sec sliding, 10-sec overlapping, windows to predict activity type and EE (METs). Estimates were compared to direct observation labeled activities and METs from the K5. A between-subject 10-fold cross-validation method was used for model evaluation, with performance metrics averaged across the folds reported. F1-scores and root-mean squared error (RMSE) were used to assess model performance for activity classification and MET estimation, respectively.

Results: The right wrist had the highest activity classification (F1-score, mean±sd; 0.61±0.07) compared to the other locations (LW: 0.58±0.06, RA: 0.54±0.04, hip: 0.53±0.03, LA: 0.52±0.06). The hip had the lowest MET estimation error (RMSE; 1.42±0.22) compared to the other locations (RA: 1.44±0.24, LW: 1.54±0.20, LA: 1.55±0.40, RW: 1.56±0.20).

Conclusion: Model performance was poorer than expected due to the large number of activity labels: activities with similar movement patterns were often misclassified. Future work should continue to include a variety of activities to challenge the limits of wearable devices. Additionally, more research should be conducted in varying populations and contexts to determine an optimal single-site wear location, if one exists.

SO.1.05-13

Effects of the Diameter App: A Blended-care Lifestyle Intervention for Individuals with Type 2 Diabetes

C. Lansink¹, S. Pots-Teunissen^{2,3}, E. Hietbrink^{2,3}, N. Beerlage-de Jong⁴, R. Gannamani⁵, S. Kumaraswamy⁵, A. Middelweerd³, G.D. Laverman^{2,3}

SO.1.05 E- & mHealth: Innovation In Digital Studies and Methods Wearable Technology and Sensor-Based Assessment AI and Smart Tools for Movement Tracking

Room 4, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Type 2 Diabetes Mellitus (T2DM) is a chronic lifestyle-related condition that significantly affects quality of life and healthcare costs. Many patients lack knowledge and motivation for effective self-management, highlighting the need for personalized, motivational interventions. Real-time monitoring of glucose, nutrition, and physical activity combined with lifestyle coaching may improve diabetes management. The use of real-time monitoring of glucose

SHORT ORALS

values, nutrition and physical activity in combination with coaching aimed at lifestyle-related behavior change may improve patients' diabetes management. Therefore, the Diameter app was developed to support individual goal setting and lifestyle change in type 2 diabetes (T2D). The DIAMETER-1 study aimed to evaluate the Diameter as blended-care intervention in primary and secondary care to evaluate its feasibility.

Methods: A mixed-method, single-arm, longitudinal design was used among patients with T2D to evaluate the feasibility of the Diameter app. Patients were recruited in a regional hospital and in a general practice, both in the east of the Netherlands, Almelo. Patients used the Diameter app for 6 months, received a Fitbit and a Freestyle Libre for continuous glucose monitoring, and received daily tailored coaching messages for physical activity and diet. Body weight, waist circumference, and medication use were measured at baseline, three, and six-month follow-up, while glucose regulation and physical activity (step count and moderate-to-vigorous activity) were measured continuously. Changes were analyzed using linear mixed models. Data collection has been completed.

Results: A total of 74 patients were included, of them 67 participants completed the study (mean age 60.1 ± 9.4 years; mean diabetes duration 12.7 ± 8.8 years; 46% female). Interim analyses showed positive and clinically relevant effects for BMI and waist circumference after six months. Fitbit and Freestyle Libre data showed high adherence, whereas low completion rates were seen for dietary logbooks. The Diameter app was rated positively. Final data analysis is ongoing.

Conclusion: These findings indicate that the Diameter tool is feasible for use in routine diabetes care and may provide short-term benefits. Reductions in BMI, waist circumference, and medication needs suggest that the app's real-time feedback and coaching can support lifestyle changes, enhance self-management, and lessen treatment burden for individuals with type 2 diabetes.

SO.1.06-02

Why Context Matters When Evaluating the Impacts of Playground and Park Renovations on Park Use and Physical Activity

K. Burford¹, J. Han¹, M. Hughey², J. Schipperijn³, E. Piotrowski¹, A. Hipp¹

¹North Carolina State University, Department of Parks, Recreation and Tourism Management, Raleigh, United States,

²College of Charleston, Department of Public Health Sciences & Administration, Charleston, United States, ³University of Southern Denmark, Department of Sport Science and Clinical Biomechanics, Odense, Denmark

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings

Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The few studies indicating positive effects of park or playground renovations occur within a single highly specific context and thus lack generalizability. To begin to understand the importance of context within natural experiments, we compared evaluations of two studies of park and playground renovations on park use and physical activity in low-income and high racial minority U.S. neighborhoods.

Methods: A quasi-experimental pre-post study design was used to evaluate the impacts of the renovations on park use, playground use, and park-based moderate-to-vigorous physical activity (MVPA) in Rocky Mount, NC (2023-2025), and in Baltimore, MD (2018-2022). For both studies, one intervention park received park/playground renovations, which was matched to one control park on neighborhood-level measures (income, race, population). The System for Observing Play and Recreation in Communities (SOPARC) measured outcomes at renovated and control parks over 5-11 days pre/post renovation. Difference-in-difference (DiD) mixed effects negative binomial regression models estimated renovation effects, adjusted for day of week. Placer.ai's mobile device data measured weekly average visitors to the parks/playgrounds over 3-5 months pre/post renovation. Descriptive statistics determined the pre/post change in visitors with mobile devices at each park/playground.

Results: For the renovated park in Rocky Mount, analyses indicated significantly greater increases in park use (IRR = 43.6, 95% CI: 11.8-161.4), playground use (IRR = 28.5, 95% CI: 6.1-133.6); and park-based MVPA (IRR = 40.0, 95% CI: 11.1-144.8) from 2023 (pre) to 2025 (post), compared with the control. For the renovated park in Baltimore, interaction terms were not statistically significant ($p > 0.05$), indicating no difference in study outcomes from baseline (2018) to post-renovation data collection waves (2019-2022) compared with the matched control. However, analyses of Placer.ai data indicated weekly average visitors increased by 176% for renovated playgrounds in Baltimore and by 102% for renovated playgrounds in Rocky Mount, and declined by 74% and 62%, respectively, for controls parks.

Conclusion: As both studies implemented similar methods, differences in evaluation findings may be best interpreted by the unique social (community-engagement), temporal (length of closure, COVID-19), economic (renovation funding), geographic (access, neighborhood turnover), and other contextual factors that occur over the course of natural experiments.

SO.1.06-03

Climate Change Mitigation Interventions and their Impact on Physical Activity: A Systematic Review

A. Lehmann¹, L. Benz¹, L. Paulsen¹, M. Schröder¹, C. Jochem², J. Bucksch¹

¹Heidelberg University of Education, Prevention and Health Promotion, Heidelberg, Germany, ²University of Bayreuth, Planetary & Public Health, Bayreuth, Germany

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings
Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Climate change mitigation measures have the potential to generate co-benefits for human health, including increased physical activity. However, empirical evidence from real-world mitigation interventions compared to simulation studies remains scarce. To date, no systematic synthesis has examined how such interventions affect physical activity - either intentionally or incidentally. This systematic review therefore aims to summarise the available evidence on climate change mitigation interventions that impact physical activity as a co-benefit.

Methods: Three databases (PubMed, Scopus, and GreenFILE) were searched for peer-reviewed English-language studies from inception until July 2025 using terms related to 'mitigation', 'climate change', 'intervention' and 'physical activity'. Studies were included if they evaluated real-world climate change mitigation interventions and assessed impacts on physical activity using controlled pre-post designs. Methodological quality of included studies was assessed using five binary criteria applied in previous active travel intervention reviews. Due to heterogeneity in intervention types, participants and outcome metrics, a narrative synthesis was conducted, categorising studies by intervention level according to the socio-ecological model. Effects on physical activity were summarised descriptively and based on their statistical significance. The study protocol was prospectively registered with PROSPERO (CRD420251136610) and the review followed PRISMA guidelines.

Results: The initial search yielded n=8061 articles, of which ten studies were finally included. Most studies were conducted in high-income countries using quasi-experimental or natural experimental designs. Interventions were implemented at three main levels: (1) policy measures (n=4) such as emission control zones and national low-carbon development programmes; (2) environmental and infrastructure changes (n=2) including improvements to walking, cycling, and public transport facilities; and (3) individual-level approaches (n=4) involving behavioural, educational, or incentive-based strategies. The most studied physical activity outcomes were cycling (n=6) and walking (n=4). Seven studies reported positive effects on physical activity, while three found no statistically significant, though positive, changes. Study quality was rated as high in 20% of studies, moderate in 60% and low in 20%.

Conclusion: This review demonstrates that climate change mitigation interventions can positively influence physical activity, highlighting their potential as co-beneficial strategies for planetary and public health. Further studies across different intervention levels using similar strategies are needed to substantiate these findings.

SO.1.06-06

Catalyzing a Paradigm Shift in Neurodegenerative Care: Endorsement of Exercise Consultation in Physical Therapy for Multiple Sclerosis and Parkinson's Disease

D. Kinnett-Hopkins¹, M. Hendricksen², C.-C. Lin¹, D. Ryan³, M. Rafferty²

¹University of Michigan, Kinesiology, Ann Arbor, United States, ²Shirley Ryan AbilityLab, Chicago, United States, ³Michigan Medicine, Physical Therapy, Ann Arbor, United States

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings
Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The safety, benefits, and effectiveness of exercise for people with multiple sclerosis (MS) and Parkinson's disease (PD) are well documented. Despite this evidence, people with MS and PD are less physically active than those without the disease, and this gap widens as the diseases progress. Physical therapists (PTs) are uniquely positioned and can facilitate exercise behavior change. However, traditional physical therapy focuses on function restoration rather than proactive activities to prevent the advancement of morbidity. This study evaluated the perceived acceptability, appropriateness, and feasibility of an innovative consultative low-dose model of Proactive Physical

SHORT ORALS

Therapy (PAPT) across interested groups and assessed organizational readiness for implementation.

Methods: This study employed a cross-sectional design using an online survey. Participants included people with MS and PD, Caregivers, PTs, and Healthcare Administrators. Measures included the Acceptability (AIM), Appropriateness (IAM), and Feasibility (FIM) scales, perceived organizational change interest (Organizational Readiness for Implementing Change, change commitment sub-scale), and an open-text section for feedback. One-way ANOVAs were conducted to test group mean differences on the scales of AIM, IAM, and FIM.

Results: The sample consisted of 106 respondents recruited from two health systems in the Midwest, USA. Perceptions of the PAPT model were overwhelmingly positive across all groups as evidenced by mean scores ≥ 4.15 on the AIM, IAM, and FIM scales. Descriptive analysis showed a strong consensus, with 80% to 100% of respondents agreeing (≥ 4) on nearly all individual items. One-way ANOVAs revealed no significant differences in mean scores across stakeholder groups for Acceptability ($F(4, 93)=0.308, p=0.87$), Appropriateness ($F(4, 92)=0.467, p=0.76$), or Feasibility ($F(4, 93)=0.665, p=0.62$). Open-text responses confirmed high support from patients, but identified reservations related to financial cost and clinic capacity. Provider groups reported high perceived organizational readiness for change commitment (ORIC Mean: PT=4.33, Admin=4.50).

Conclusion: The PAPT model is rated as highly acceptable, appropriate, and feasible, demonstrating a strong level of consensus across the entire stakeholder spectrum. The high consensus and perceived organizational change commitment support immediate pilot testing in clinical practice to advance sustained physical activity engagement in MS and PD populations.

SO.1.06-07

Implementation Outcomes and Scalability Potential of a Land- and Water-based Multicomponent Exercise Program for Women with Fibromyalgia: The al-Ándalus Project

I.C. Álvarez-Gallardo^{1,2}, B. Gavilán-Carrera³, V. Segura-Jiménez⁴, M. Delgado-Fernández⁵, M. Borges-Cosic^{1,2}

¹Faculty of Education, University of Cádiz, Puerto Real, Spain, ²Instituto de Investigación e Innovación Biomédica de Cádiz (INIBICA), Cádiz, Spain, ³University of Granada, Department of Physical Education and Sports, Granada, Spain, ⁴Instituto de Investigación Biosanitaria ibs. Granada, Granada, Spain, ⁵Faculty of Sport Sciences, University of Granada, Granada, Spain

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings
Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The benefits of exercise for women with fibromyalgia are well-documented. The effectiveness of the al-Andalus project exercise intervention program has been reported. Thus, we aimed to evaluate the implementation outcomes (adherence, fidelity, and safety) of a 24-week supervised multicomponent exercise program carried out in land and water settings for women with fibromyalgia, and to assess its readiness for scale-up within community-based rehabilitation contexts.

Methods: A total of 244 women with fibromyalgia (mean age=50.8 $\pm$ 7.6 years) from seven Andalusian provinces were assigned to land-based ($n=80$), water-based ($n=79$), or control ($n=85$) groups. Intervention arms, developed in 17 groups (5 provinces), completed 24-weeks (3 days/week) of supervised multicomponent 60 min/sessions (aerobic, strength, flexibility). Implementation outcomes included adherence (attendance rate), fidelity to planned training intensity (Rate of Perceived Exertion -RPE- and %Heart Rate -HR- max), and safety (adverse events registered). Contextual implementation factors, including facility availability and suitability (costs, schedules and depth and water temperature) were documented through a qualitative log of logistical challenges encountered during facility recruitment. Descriptive continuous data were presented as mean and standard deviation, whereas categorical data as percentages.

Results: Mean attendance was 82.9% in the land-based and 79.1% in the water-based groups. Fidelity analyses confirmed that both interventions were performed at a moderate intensity (mean RPE=12.2 $\pm$ 1.6; %HRmax=58.5 $\pm$ 5.1 for land-based and 53.4 $\pm$ 5.2 for water-based sessions), consistent with protocol expectations. Regarding safety, only one minor adverse event was reported (a skin allergy related to pool water). Concerning contextual implementation factors, challenges were encountered in identifying suitable facilities: none of the fibromyalgia associations had access to pools (0%), and in two provinces, no pools met the required availability and suitability criteria, allowing only the land-based intervention.

Conclusion: A 24-week multicomponent exercise program for women with fibromyalgia was safe, implemented with high fidelity to the prescribed protocol, and maintained a high adherence in both land- and water-based settings.

SHORT ORALS

These findings suggest strong readiness for community-level scale-up. However, the water-based format entailed greater logistical and economic demands, making the land-based format a more feasible option for the general population of people with fibromyalgia.

SO.1.06-08

A Leaner Approach to Remotely Delivered Behavioral Weight Management: 3-month Outcomes from the EVO Decentralized Comparative Effectiveness Clinical Trial

A. Pfammatter¹, I. Oyetunji², R. Moss¹, C. Olvera³, L. Murphy¹, A. Hernandez¹, J. Siddique⁴

¹The University of Tennessee, Knoxville, College of Education, Health, and Human Sciences, Knoxville, United States,

²The University of Tennessee, Knoxville, Nutrition, Knoxville, United States, ³Northwestern University Feinberg School of Medicine, Division of Geriatrics, Chicago, United States, ⁴Northwestern University Feinberg School of Medicine, Preventive Medicine, Chicago, United States

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings
Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Obesity is a leading public health challenge, with high economic and cardiometabolic costs. Intensive lifestyle intervention is the gold standard for behavioral treatment of obesity, but the burden and expense of available programs limit scalability. In a previous trial, we used the Multiphase Optimization Strategy to identify a lower cost, remotely delivered obesity intervention that achieved clinically meaningful weight loss, which we call EVO. Our ongoing trial tests EVO for non-inferiority versus a currently available program in achieving weight loss over 6 months. Herein, we present complete interim findings at 3 months.

Methods: We recruited adults (ages 18-70) with obesity (BMI 30–45 kg/m²) to participate in a 2-arm randomized controlled trial. We randomized participants, stratified by sex, to receive EVO (a mobile app, online lessons, and 12 bi-weekly, 10-15 minute telephone coaching sessions) or DPP (Center for Disease Control's PreventT2 curriculum, delivered remotely in 16 one-hour, one-on-one video sessions). Assessors masked to condition collected weight with wireless scales during remote video assessments.

We modeled weight as a function of treatment (EVO or DPP), time (Baseline or 3-month) and treatment*time using a linear covariance pattern model. We defined EVO non-inferior if the upper 90% confidence limit for the estimated mean difference in weight change between EVO and DPP is below 3.2kg.

Results: We randomized 524 participants (90% female, mean age 54 years) from 46 U.S. states and the District of Columbia. 263 participants (Mean baseline BMI/weight: 35.96/98.96kg) received EVO; 261 (Mean baseline BMI/weight: 35.31/97.65kg) received DPP. Slightly fewer than half of all participants (43%; n=227) achieved 5% weight loss by 3 months (EVO: 46%; DPP: 41%). Over 3 months, EVO participants lost an estimated 4.14kg and DPP participants lost an estimated 3.36kg. The estimated mean difference in weight change for EVO participants compared to DPP is -0.78kg (p=0.02, 90%CI [-1.34, -0.21]).

Conclusion: Our initial findings suggest that EVO is not only non-inferior but superior to DPP in achieving weight loss over 3 months. Forthcoming analyses will test EVO's non-inferiority over 6 months (our primary endpoint), evaluate EVO's cost-effectiveness, and test effects at 12-months to inform policy and clinical translation.

SO.1.06-09

Boundary Spanning in Project Starting Block: Engaging Marginalized Youth through Sport and Mentoring

T. Skovgaard¹, S. Schulze Morley¹, L. Briand Thomsen¹

¹SDU, Department of Sports Science and Clinical Biomechanics, Odense, Denmark

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings
Room 5, May 28, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Project Starting Block (PSB) is a Danish civil-society initiative that combines sport and mentoring to engage 18–29-year-olds not in education, employment, or training (NEET). Central to PSB is the Bridge Builder—a boundary-spanning role designed to translate program components into everyday routines that participants can relate to and sustain. This study examined how the Bridge Builder influenced participant engagement and early outcomes during PSB’s pilot phase, providing insights into relational implementation mechanisms in community-based interventions.

Methods: A mixed-methods process evaluation was conducted across four club–municipality clusters ($n = 89$). Data sources included a baseline questionnaire (63% response rate, $n = 56$), attendance logs, ten structured observations, and semi-structured interviews with participants, Bridge Builders, caseworkers, and club staff ($n = 34$). Quantitative data were analyzed descriptively, while qualitative data were thematically coded in two cycles to identify recurring patterns and mechanisms of engagement.

Results: Participants (mean age = 24.5 years) attended two to five weekly sessions combining sport and mentoring. Median attendance ranged from 52% to 86%, described by staff as higher than comparable municipal programs. Thematic analysis showed that the Bridge Builder

- (1) linked silos by coordinating across welfare, club, and community settings;
- (2) built relational trust—participants described the Bridge Builder as a “lifeline” providing safety and continuity;
- (3) translated intervention elements into motivating, individualized routines; and
- (4) mediated tensions, such as balancing flexible attendance with job center requirements.

Many participants reported improved daily structure, energy, and social connectedness, with a subgroup showing initial steps toward employment or education.

Conclusion: The boundary-spanning Bridge Builder role helped embed PSB’s activities in participants’ everyday lives, supporting strong attendance and functional gains. Findings illustrate how relational implementation roles can enhance participation and transition outcomes among marginalized youth. By linking sport, social inclusion, and boundary-spanning practice, this study contributes to understanding how community-based initiatives can foster meaningful engagement and help bridge the gap between welfare systems and everyday life for specific groups of young adults.

SO.1.06-10

Exploring General Practice Nurses’ Capacity for Screening and Advising on Movement Behaviours

A. Beecroft¹, A. Chapman², S. Sahlqvist¹, D. Dunstan¹

¹Deakin University, Institute for Physical Activity and Nutrition, Melbourne, Australia, ²Deakin University, Institute of Health Transformation, Melbourne, Australia

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings
Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The primary healthcare setting has been supported as an appropriate setting to target changes in individual movement behaviours, helping address the growing burden of non-communicable disease. The existing challenges for General Practitioners in providing physical activity counselling have been extensively reported; however, more research is required to understand the role of General Practice Nurses in delivering these types of interventions. This study aimed to develop a deeper understanding of the capacity, opportunities, and challenges for nurses working within Australian general practice to complete screening and provide brief advice on sedentary behaviour and physical activity within existing models of primary healthcare.

Methods: A qualitative descriptive study design utilising individual interviews with 19 General Practice Nurses was conducted. Participants completed online, audio-recorded, semi-structured interviews that were digitally transcribed. Inductive thematic analysis was completed in line with the six-phase approach as described by Braun and Clarke.

Results: Four primary themes were identified. Theme 1- *Opportunities*; highlighted the different opportunities that exist for General Practice Nurses to conduct PA and SB screening and provide subsequent advice to patients, such as during health assessments or the provision of wound care. Theme 2- *Capabilities*; identified gaps in the current knowledge and skills of General Practice Nurses in delivering these interventions, with nurses having more confidence in providing physical activity-related advice than promoting sedentary behaviour-related changes. Theme 3- *Challenges*; reflected the barriers, such as patients’ expectations and the time constraints that exist for General Practice Nurses in delivering this assessment and advice within primary healthcare. Finally, Theme 4- *Enablers*; identified the personal, organisational, and system-structural enablers that exist. These included having relationships and strong referral pathways with allied health professionals, and the use of specific screening tools to

SHORT ORALS

help nurses assess patients' movement behaviours.

Conclusion: While further research is needed, these findings recognise the role and opportunities that exist for General Practice Nurses in delivering physical activity and sedentary behaviour interventions within primary healthcare. Policymakers may wish to support the provision of training and education material to upskill General Practice Nurses in providing movement behaviour change assessment and advice to their patients.

SO.1.06-12

Anchoring Active Communities: Long-term Impact of a Co-created Social Prescribing Intervention Linking Municipal Rehabilitation Programs with Civil Society Engagement for Active Living

I.K Thorsen¹, M. Lønberg¹, J. Midtgaard², A. Varming³

¹Copenhagen University Hospital - Rigshospitalet, The Centre for Physical Activity Research, Copenhagen, Denmark,

²Copenhagen University Hospital - Mental Health Services, Centre for Applied Research in Mental Health Care (CARMEN), Copenhagen, Denmark, ³Copenhagen University Hospital, Steno Diabetes Center Copenhagen, Copenhagen, Denmark

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings
Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Understanding how social prescribing interventions are anchored in local health care and civil society is crucial for developing sustainable models. This follow-up study explores how a co-created social prescribing intervention promoting physical activity engagement is anchored in a Danish socioeconomically disadvantaged rural municipality 1.5 years after completion of project Active Communities.

Methods: This was a qualitative multi-methods study, including a process log, focus groups, and interviews. The *process log* was based on field notes and minutes from twelve meetings between the research project leader, the municipal link worker, and the municipal consultant on civil society organizations, documenting activities and other indicators of adaptation and anchoring of the intervention in practice. We conducted three *focus groups* with civil society representatives, municipal employees, and citizens in rehabilitation programs; and two *interviews* with the municipal link worker and the team leader to investigate experiences with the intervention.

The process log was made from January 2024 to May 2025 and condensed into a chronological overview of key developments. Focus groups and interviews were conducted and audio-recorded in June-July 2025, transcribed, and thematically analyzed across domains: original linking elements (link worker, digital platform, visiting program, co-created activities), organizational development, cross-sector collaboration, and citizens' engagement.

Results: Focus groups included five citizens in the target group (three men, two women; aged 46–78), five civil society representatives (two patient associations, two community-based fitness centers, and one sports club), and seven municipal employees (a consultant on civil society organizations, a team leader, a community health nurse, and four physiotherapists).

The main result was that the linking activities were embedded into organizational structures, including implementation of social prescribing in health professionals' practice. The initial co-creation process continued to build trust, while policy and budgetary contexts supported the linking activities. This included anchoring of the link worker function in municipal practice; transforming the digital portal into a publicly community platform; and strengthened collaboration with the civil society.

Conclusion: This study provides insights into the local anchoring of a co-created social prescribing intervention. Findings may inform scaling and adaptation of social prescribing models to strengthen cross-sector collaboration to support citizens' physical activity engagement.

SO.1.06-13

Organizational Mechanisms through which Implementation Strategies Lead to Implementation Fidelity in a National Study of Churches in the United States

A. Kaczynski¹, R. Saunders¹, J. Parker Brown¹, S. Wilcox¹, C. Rudisill¹, B. Hutto¹

¹University of South Carolina, Arnold School of Public Health, Columbia, United States

SHORT ORALS

SO.1.06 Implementation and scalability: Scaling Implementation Strategies Across Community Settings Room 5, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Churches can be important community settings for promoting physical activity (PA) and healthy eating (HE), but more implementation science research is needed to understand the mechanisms of change through which implementation strategies lead to positive implementation outcomes. This study examined whether church committee completion of a web-based training and submission of a program plan (“training engagement”) was associated with PA and HE implementation fidelity directly and/or indirectly, mediated via the number of committee meetings and committee meeting attendance (“committee implementation engagement”).

Methods: This study occurred in churches across the US (n=103) participating in the Faith, Activity, and Nutrition (FAN) program. Church committee training engagement (primary independent variable) was comprised of three levels based on two indicators: full engagement (completed 7-8 of 8 lessons and submitted a program plan), partial engagement (completed 7-8 lessons but did not submit a plan), or low engagement (completed <7 lessons and did not submit a plan). Committee implementation engagement (mediating variable) was operationalized with two indicators: number of committee meetings in the past 12 months and average meeting attendance. Implementation fidelity (outcome variable) for both PA and HE were composite scores comprised of baseline to 12-month changes in four FAN components: messages, opportunities, policies, and pastor support. Structural equation modeling was used to examine associations between committee training engagement, committee implementation engagement, and implementation fidelity.

Results: Overall, 43.7%, 42.7%, and 13.6% of churches had full, partial, or low engagement in training, respectively. Structural equation modeling results showed that a higher level of committee training engagement was significantly related to greater committee implementation engagement, with full engagement (path coefficient=1.40, p=0.002) twice as impactful as partial engagement (0.70, p=0.098). In turn, committee implementation engagement was significantly related to PA (0.77, p<.001) and HE (0.77, p<.001) implementation fidelity. The effects of committee training engagement on PA and HE implementation fidelity outcomes were fully mediated through committee implementation engagement.

Conclusion: These findings provide increased understanding of how key implementation strategies may lead to stronger implementation fidelity in church settings with the potential to reach large numbers of individuals experiencing health disparities (e.g., African American, rural, older adults).

SO.1.07-01

Evaluating Place-based Whole Systems Approaches: A Realist and Configurational Comparative Analysis of Systemic Change

S. Armour¹, K. Shearn¹, R. Storey¹, R. Davies², E. Elzayyadi¹, J. Woodward¹

¹Sheffield Hallam University, College of Health, Wellbeing and Life Sciences, Sheffield, United Kingdom, ²Independent Monitoring and Evaluation Consultant, Cambridge, United Kingdom

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The National Evaluation and Learning Partnership (NELP), commissioned by Sport England, has developed a whole-system realist approach to evaluate Place-Based Whole Systems Approaches (PBSAs) aimed at reducing physical activity inequalities. This responds to the complexity of social determinants and seeks to understand mechanisms through which local collaborative initiatives may contribute to systemic changes plausibly associated with shifts in population-wide physical activity.

Methods: This paper details two evaluative practices

1. Configurational Comparative Analysis (CCA) to identify patterns across local Places, each representing a Local Authority adopting PBSAs. Attributes were dichotomised to produce crisp-set data and analysed using EvalC3 software, generating decision-tree models to identify configurations predicting outcomes. Data collection in 2024 included 46 attributes per Place (n=47) across:
 - Context indicators (geography, demographics, socio-economic conditions).
 - Resource measures (investment and deployment).
 - System maturity measures (extent of systemic ways of working), assessed via a System Maturity Matrix and moderated for consistency.

SHORT ORALS

2. Participatory Sense Making to interpret and explain the models generated through the CCA. This enabled us to co-produce rich cross and within place explanations of change complemented by documentary evidence.

Results: We will share illustrative findings from our analysis of 2024 data, focusing on the outcome of “inclusive cultures and practices”, and our latest (2025) round of data collection. Our analysis of 2024 data (47 cases) found configurations strongly predicting development of an inclusive social environment for physical activity included stronger community voice and influence in the work, as well as high levels of supported community-led action. Sense-making workshops highlighted mechanisms such as cultivation of leadership within the community along with the need for agencies holding power in the system to relinquish control and enable communities to act autonomously, while offering supportive and empowering interaction where needed.

Conclusion: This approach demonstrates the value of combining realist theory-building with CCA to explore complex causal patterns in systems change. The methods offer a structured, complexity-sensitive approach for evaluating systemic conditions and pathways to impact, with potential applicability beyond physical activity. Future work will refine models, deepen mechanism testing, and explore international relevance.

SO.1.07-02

Healthy School Lunches in Europe: A Causal Loop Diagram to Identify Opportunities and Challenges

M. Struiksmā¹, A. Wargers¹, L. Tyrions², B. van der Sande¹, W. Jansen^{1,3}

¹Erasmus Medical Center, Public Health, Rotterdam, Netherlands, ²Rikolto, Leuven, Belgium, ³City of Rotterdam, Social Development, Rotterdam, Netherlands

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Most children worldwide show poor dietary habits, especially for children in poverty this is a great public health concern. School lunches can contribute to healthy dietary behaviours and food equity, ensuring that all children have access to at least one nutritious meal per day, like stated in the European Child Guarantee. However, only some European countries currently offer school meal programs. Therefore, the aim of this study is to identify factors and their interactions within the complex system of providing school lunches in Europe and to visualize and analyse this in a causal loop diagram (CLD). The CLD serves as a tool to identify leverage points for improving existing or developing new school lunch programs.

Methods: This study is part of the European Healthy Wave project and presents the results of Group Model Building (GMB) sessions which took place in 2024 and 2025 with experts from European cities and regions in Bulgaria, Italy, Latvia, Netherlands, Portugal, Romania and Sweden. In Italy, Portugal, Romania and Sweden, experts joined two GMB sessions to firstly identify factors influencing the dynamics of the healthy school lunch system in European local contexts and secondly to connect those factors in a visualized relation map. The four country specific maps were comprised by researchers in one CLD and afterwards discussed in a GMB session with twenty Healthy Wave partners from all seven countries (schools, municipalities, NGO's). Researchers adapted the final version of the CLD according to this feedback and identified feedback loops to show leverage points within the complex system.

Results: The CLD demonstrates three main themes: child & family, school, policy & regulation. It also demonstrates the interactions within and between those themes. We identified two main factors affecting the successful implementation of school lunches: 'children enjoying the school lunch' and 'level of food and diet quality and safety'. Those factors relate to each other, but also depend on or affect other practical, motivational and policy factors.

Conclusion: This study identifies important factors affecting the system of providing school lunches and offers policymakers and researchers insights into the factors that need to be considered when implementing school lunches.

SHORT ORALS

SO.1.07-04

Complex System of Factors and Actors Promoting Physical Activity in Young Children. Results from Different Dutch Regions and Developmental Stages (0–3, 3–6 Years)

L. Wilderink¹, B. Nijenhuis², S. Veldman¹, I. Huiberts¹, K. Bel^{3,4}, S. de Vries^{3,4}, E. Hartman², A. Singh¹

¹Mulier Institute, Utrecht, Netherlands, ²University Medical Center Groningen, University of Groningen, Department of Human Movement Sciences, Groningen, Netherlands, ³The Hague University of Applied Sciences, Research Group Healthy Lifestyle in a Supporting Environment, Centre of Expertise Health Innovation, The Hague, Netherlands, ⁴Leiden University Medical Centre Health Campus The Hague, Department of Public Health and Primary Care, The Hague, Netherlands

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Physical activity in young children is shaped by interrelated factors that operate as a complex system. Gaining insight into these factors and their connections within local contexts is essential for designing regionally tailored approaches that can catalyse systemic change. This study identifies system factors and actors influencing physical activity among children aged 0–3 and 3–6 years, and examines similarities and differences across regions and developmental stages.

Methods: First, a national expert panel completed an online survey to select, from a literature-based list, the 15 most influential factors affecting physical activity in the Netherlands for both developmental stages. Next, local stakeholders in five regions (three for ages 0–3 and two for ages 3–6) prioritized the factors relevant to their regional context. In each region, two group model building sessions were held with local stakeholders. During the first session, stakeholders identified the underlying causes of the prioritized factors and mapped relationships between them. System maps were digitized using Vensim, and reinforcing and balancing feedback loops were identified and added to the map. In the second session, stakeholders reflected on their region's system map and identified potential places to intervene, including which actors were positioned to intervene. Cross-cutting mechanisms across regions were identified through comparative analysis of the system maps.

Results: Five system maps (one per region) illustrate how interrelated factors influence physical activity, including feedback loops representing mechanisms that reinforce or balance system behaviour. Cross-cutting mechanisms were identified across developmental stages and regions, highlighting shared places to intervene as well as stage- and context-specific differences. Two powermaps (one per developmental stage) show which stakeholders hold the potential to drive system change.

Conclusion: This study demonstrates a regionally tailored, systems-based approach to understanding the complex factors and actors that shape physical activity in early childhood. The system maps and powermaps provide practical insights into both what drives physical activity and who is positioned to create change. Repeatedly making system maps participatory is time-consuming, which makes it relevant to use the cross-cutting mechanisms to support future whole-system approaches to promote physical activity in young children.

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Participatory systems approaches may help promote childhood health. The Child-COOP trial examines if such an approach can promote (sustain and increase) childhood physical activity in disadvantaged communities. This study assesses baseline socioeconomic levels in the intervention communities relative to national averages and examines variations in socioeconomic status, readiness to change, and knowledge/engagement within these communities.

Methods: The five intervention communities were delineated by the populations living within the respective school district boundaries. The populations were individually linked to national registers using unique personal identification numbers. Baseline (2023) socioeconomic factors (education level, income, unemployment rate, civil status, and immigration) were obtained from Statistics Denmark and categorized according to national guidelines.

Readiness to change was assessed, using a modified version of the readiness to change brief assessment tool, through focus group interviews in each community. A total score (1-9) was calculated based on three dimensions.

Knowledge and engagement were assessed using an adapted version of the Stakeholder-driven Community Diffusion survey, distributed to participants prior to participatory workshops. Average domain scores comprised the total knowledge and engagement scores (1-5).

Results: Compared to national averages, intervention communities had an average population age 4.4 years higher and a 10% lower proportion of children aged 6–12 years. Further, the population in the intervention communities had a 12% lower income, a 44% lower proportion of immigrants and descendants, a 34% higher proportion who had a short education, a 11% higher unemployment rate, and a 7% higher proportion who were married than the national averages.

Four communities scored at stage 4 (Pre-planning phase: action needed) for readiness to change; one scored at stage 5 (Preparation phase: action initiated). Knowledge and engagement scores were similar across the communities and at a medium level (knowledge: 3.72 (SD: 0.07); engagement: 3.76 (SD: 0.05)).

Conclusion: The Child-COOP trial is ongoing with the participatory systems approach being implemented. Baseline findings showed lower socioeconomic status in the five intervention communities compared to national averages. We observed a uniform starting point for socioeconomic status, readiness to change, and knowledge/engagement across the intervention communities - an advantage for the subsequent evaluation of Child-COOP.

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Temporal eating behaviors may influence metabolic health when misaligned with circadian rhythms, contributing to impaired glucose regulation and increased type 2 diabetes (T2D) risk. Meal-timing variables, such as timing of the first and last eating occasions, nighttime fasting duration, and time elapsed between wake-up and first meal (wake-up-to-firstmeal) or from dinner to bedtime (dinner-to-bedtime) are strongly interrelated, leading to multicollinearity that limits conventional analytical approaches. This study applied alternative methods to better capture the multidimensional structure of chrono-nutritional behaviors and their associations with T2D.

Methods: GCAT is a prospective cohort investigating genetic and environmental determinants of chronic diseases in adults from Catalonia, Spain. Multivariable logistic regression models estimated associations between individual meal-timing variables and incident T2D diagnosis from electronic health records. Quantile g-computation was used to assess the joint association of the mixture of meal-timing variables and to estimate each variable's relative contribution to overall risk.

Results: A total of 6,858 participants were included, with 151 developing T2D during a median follow-up of 6 years. The 58.6% of the study population are women and the median age is 52 (IQR 47-58). A later first meal was associated with lower T2D risk (OR for 1h increase 0.81 [95% CI: 0.70–0.94]), while a later last meal was associated with higher risk (OR 1.35 [95% CI: 1.07–1.70]). Longer nighttime fasting was inversely associated with T2D (OR 0.74 [95% CI: 0.59–0.93]). A longer wake-up-to-firstmeal was linked to lower odds, whereas dinner-to-bedtime showed weaker evidence. Eating

SHORT ORALS

jetlag and the number of eating occasions were not associated with T2D in single exposure models. When analyzed jointly as a mixture, a one-IQR increase across all variables was associated with lower T2D risk (OR 0.61 [95% CI: 0.41–0.90]). Nighttime fasting contributed most strongly to the overall association, followed by eating frequency and dinner-to-bedtime reflecting potential synergistic effects among correlated chrono-nutritional behaviours.

Conclusion: Mixture-based analytical methods provide a valuable approach to assess the joint associations of correlated meal-timing variables. Nighttime fasting appears to play a central role, independently of meal timing. Promoting awareness of the importance of chrono-nutritional behaviors may help prevent T2D in the general population.

SO.1.07-08

Leveraging Multi-sectoral Collaboration and Co-benefits for Physical Activity Promotion: A Local Government Case Study from Fujisawa City, Japan

Y. Oguma^{1,2}, K. Kikuchi^{2,1}, N. Yoshida¹, N. Takeda³, Y. Saito⁴

¹Keio University, Sports Medicine Research Center, Yokohama, Kanagawa, Japan, ²Keio University, Graduate School of Health Management, Fujisawa, Kanagawa Japan, Japan, ³Kogakuin University, Tokyo, Japan, ⁴Nippon Sport Science University, Kanagawa, Japan

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: To analyze the process of developing and implementing a municipal physical activity (PA) policy in Fujisawa, Kanagawa, under the national *Health Japan 21* framework. This presentation aims to examine how the city's multi-sectoral collaboration efforts align with systems-based principles, and to offer valuable insights for sustainable health promotion in the Japanese local context.

Methods: The study adopted a multi-phase qualitative approach focused on institutional practice. The initial phase involved benchmarking the city's PA policy against the four strategic objectives of the WHO Global Action Plan on Physical Activity 2018–2030 (GAPPA). Subsequently, in August 2021, qualitative interviews were conducted with relevant municipal departments including health, sports, urban planning and policy planning, to understand their perspectives and challenges regarding multi-sectoral collaboration. This was followed by a joint departmental workshop to facilitate shared understanding and identification of co-benefits in January 2022. A follow-up interview survey was conducted with the relevant departments in August–September 2024 to assess the ongoing progress of collaboration and joint actions.

Results: The initial GAPPA benchmarking and inter-departmental interviews revealed significant opportunities for co-benefit realization, which fueled the subsequent multi-sectoral workshop. Although the city didn't explicitly adopt the term „systems approach“ methodology, the process of deliberately leveraging co-benefits and adopting a multi-sectoral perspective to oversee the entire policy landscape was proved effective in aligning disparate departmental efforts toward a shared public health goal. The 2024 follow-up interviews provide timely data on how this collaborative momentum is being sustained, formalized, or challenged in the „action phase,“ reflecting the realities of working within established governmental structures.

Conclusion: The approach taken by Fujisawa offers a practical, domestically-driven model for systemic change. While the city's efforts predate the full rollout of the national *Health Japan 21 (Third Edition)* (starting in 2024), which explicitly provides detailed logic models and action plans suggestive of a national systems-based strategy, the city's experience with bottom-up multi-sectoral collaboration, centered on shared objectives and co-benefits, serves as a crucial case study. The findings demonstrate the feasibility and relevance of systemic thinking, even without the formal label, for Japanese local governments seeking to operationalize sustainable PA promotion under new national guidelines.

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Systems approaches have the potential to address complex public health problems, such as adolescent mental health. These approaches are often initiated and led by researchers, who typically guide the problem analysis. However, the resulting actions often need to be implemented, adapted and sustained by local governments and organizations. Little is known about how to effectively shape this transition from researcher-led analysis to practice-led action. This study reflects on two researcher-initiated approaches to achieve systemic change for better adolescent mental health in three Dutch municipalities. Thriving Teens focuses on enhancing the mental wellbeing of preadolescents (9-12 years old) in three neighborhoods in Amsterdam. Minding the Gap aims to improve the mental health of adolescents (12-25 years old) growing up in poverty in two neighborhoods in Utrecht and Amersfoort.

Methods: A qualitative evaluation examined how both projects approached collaboration between researchers and local partners, and the impacts of the employed systems tools at different system levels. Data collection included realist-informed Ripple Effects Mapping (RREM) workshops, document analyses, and semi-structured interviews with project stakeholders for both projects. All data were integrated into a RREM map for each project to trace how impacts evolved over time and to explore mechanisms driving or constraining change. Underlying mechanisms were compared between projects and analyzed following the broad and narrow path theory as described by Gadsby & Wilding (2024).

Results: We found differences and similarities regarding researchers roles, involvement of decision-makers, the use of systems tools and reflections on narrow versus broad pathways. Key lessons include:

- (1) successful implementation requires multisectoral engagement from local government beyond public health departments;
- (2) systems tools can help in building systems thinking capacity and shared understanding within local governments; and
- (3) embedding actions in existing initiatives can foster ownership and short-term outcomes, though it may constrain broader systemic focus.

Conclusion: Embedding systems approaches into local government structures to address adolescent mental health requires cross-sectoral collaboration, capacity building in systems thinking and strategic alignment with ongoing initiatives. These lessons can inform researchers, policymakers and practitioners seeking to operationalize systems thinking to address complex public health issues in local contexts.

SHORT ORALS

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Building capacity in dynamic, adaptive systems such as municipalities is essential for sustaining health promotion initiatives. In particular, strengthening collaborative capacity – the ability of diverse actors to work collectively toward sustainable community development – is critical, yet challenging. The Child-COOP Denmark trial is a three-year participatory systems approach across five local communities in five municipalities. This study investigates the relationship between capacity-building strategies and the implementation of actions as indicators of system change. Specifically, it explores if and how tailored capacity-building elements within the Child-COOP participatory systems trial catalyze action development across five local communities, thereby assessing the impact on systems transformation.

Methods: Municipal staff, including Child-COOP coordinators, participated in a 2+1 day systems training course covering modules on positioning theory, storytelling, evidence briefs, facilitation techniques, group model building elements and systems mapping. Additional capacity-building components included weekly network-of-practice meetings, stakeholder recruitment support, establishment of a school leadership network, cross-municipal leadership meetings, and several anchoring meetings within each municipality. A regional backbone office provided ongoing support. The IMPACT Process were used to document number and level of actions and emergent systems changes.

Results: Although all five municipalities received the same capacity-building elements, preliminary findings reveal substantial variation in the number and level of documented actions across communities. Analysis of action development and identification of mechanisms influencing capacity-building outcomes are ongoing and will be presented at the conference.

Conclusion: Despite a uniform implementation strategy, marked differences in number and level of action development emerged across the five communities. Early insights from the Child-COOP trial suggest that the competencies of the local municipal team – particularly the coordinator – play a pivotal role in catalyzing systems change. Further research is needed to inform the design of local teams capable of driving sustainable health-promoting transformations.

SO.1.07-12

Building Capacity for Whole Systems Realist Evaluation: Stakeholder Engagement, Learning, and Policy Influence in Place-based Systemic Working to Tackle Physical Activity Inequalities

K. Harris¹, E. Elzayyadi², J. Woodward³, J. Downey⁴, C. Oatley³, C. Szedlak¹, H. Wingfield²

¹Hartpury University, Gloucester, United Kingdom, ²Sheffield Hallam University, Sheffield, United Kingdom, ³Sport England, London, United Kingdom, ⁴University of Plymouth, Plymouth, United Kingdom

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Whole systems approaches and realist evaluation are positioned as antidotes to reductionist methods, offering nuanced understanding of context and causality in complex health systems. Despite their growing credibility, challenges persist in embedding these approaches and ensuring evaluation findings inform policy and programme design. This study explores how stakeholders engaged in a Whole Systems Realist Evaluation (WSRE) approach value, use, and translate evaluation evidence into action.

Methods: The National Evaluation and Learning Partnership (NELP), commissioned by Sport England, collaborated with multiple Place Partnerships implementing whole system place-based approaches to tackle physical inactivity. Over four years, NELP supported capacity-building through participatory evaluation methods, iterative learning cycles, and realist-informed frameworks. Eleven in-depth realist interviews were conducted with stakeholders to examine experiences of WSRE, focusing on mechanisms enabling capability development and evidence use. This was supplemented by stakeholder survey data (N=X). Data were analysed to refine programme theories and identify strategies for influencing policy and practice.

Results: Findings reveal that initial uptake required recognition of uncertainty and openness to alternative evaluation paradigms. Key enabling factors included senior leadership advocacy, external credible voices championing innovation, and social spaces for knowledge exchange. Stakeholders reported that evaluation findings informed programme design through evidence-based policy briefs, co-interpretation workshops, integration into planning cycles, and Theory of Change refinement. However, challenges emerged: entrenched beliefs about evaluation as a

SHORT ORALS

performance metric, funder-driven compliance pressures, resource demands for capacity-building, and difficulties translating complex findings into actionable language. Reflexive learning evolved gradually, complicated by multi-level governance and competing agendas.

Conclusion: WSRE can catalyse shifts in policy and programme design when supported by relational capacity-building, iterative feedback loops, and strategic communication of findings. Yet, sustaining engagement is challenging due to cultural resistance, historical practices, and perceptions of the competitive funding landscape. Embedding evaluation within decision-making requires leadership advocacy, external support, and mechanisms for translating evidence into actionable strategies. Future work should address scalability, resource constraints, and strategies to overcome institutional inertia.

SO.1.07-13

The Thriving Communities Lab – Driving Systems Change through Data-informed Learning and Cross-sector Action with a Danish Municipality

A. Vang Hjort¹, H. Bondo Andersen², N. Daugaard³, C. Bakkær Simonsen³, C. Jamil de Montgomery⁴, A. Oxlund Hoppe², J. Funck Bilsteen¹, K. Ryom³

¹Centre for Childhood Health, Copenhagen, Denmark, ²Faaborg-Midtfyn Municipality, Ringe, Denmark, ³Aarhus University, Institute of Public Health, Aarhus, Denmark, ⁴University of Copenhagen, Copenhagen Health Complexity Center, Copenhagen, Denmark

SO.1.07 Systems Science: Systems Thinking and Whole Systems Approaches to Health Promotion: Evidence, Methods, and Implementation

Room 6, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The Thriving Communities Lab aims to develop, implement, and evaluate a data-driven systems approach to promote the health and wellbeing of young people (aged 12–25) in Faaborg-Midtfyn Municipality. The Lab is a partnership between the municipality, the Centre for Childhood Health, and two Danish universities (University of Copenhagen and Aarhus University). Building on the municipality's ambition to strengthen data use and cross-sector collaboration, it works within and across municipal structures to move from fragmented efforts toward coherent, data-informed learning and action.

Methods: The Lab runs from 2025 to 2029 in a mid-sized Danish municipality (~50,000 inhabitants). It operates through two focus areas: (1) Interventions, identifying leverage points for systems change and coordinating cross-sector actions; and (2) Data use, strengthening the municipality's capacity to use data for ongoing learning and informed decision-making. Guided by the Collective Impact Framework, the Lab is anchored in a shared backbone between Faaborg-Midtfyn Municipality and the Centre for Childhood Health – with the municipality leading local efforts and the Centre ensuring overall coordination and coherence between research and practice. Embedded researchers contribute through formative evaluation, data analysis, co-creation and facilitation of participatory processes.

Results: In 2025, data analysis and involvement of local leaders, professionals, and youth led to the selection of three Intervention Areas: Sleep, Timely support for school disengagement, and Participation in community life. During 2025–2026, local stakeholders will be mobilized to jointly understand system drivers, identify places to intervene, and initiate coordinated actions within each area. By summer 2026, the Lab will present the results and lessons learned from the initial participatory and data-informed processes across the first two areas, including how the partnership facilitated these processes and early actions undertaken by local stakeholders.

Conclusion: This Danish case illustrates the establishment phase of working systemically with a local government, revealing both opportunities and tensions – for example, balancing the political need for quick wins with the research evidence supporting long-term transformation. This work will provide insight into how a municipality may lead and institutionalise a systems approach through data-driven learning, cross-sector collaboration, and systems leadership.

SO.1.08-02

Assessing Changes in Diet and Physical Activity in Indigenous Communities: A Narrative Review of Measurement Tools and Cultural Adaptation

J.C. Calderon Farfan^{1,2}, D. Bergeron¹, T.W. Delormier³, L. Lévesque⁴

¹Université du Québec à Rimouski, Department of Health Sciences, Rimouski, Quebec, Canada, ²Universidad Surcolombiana, Nursing Department, Faculty of Health Sciences, Neiva, Colombia, ³McGill University, School of Human Nutrition, Montreal, Canada, ⁴Queen's University, School of Kinesiology and Health Studies, Kingston, Ontario, Canada

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion

Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This study aimed to identify existing tools for measuring changes in diet and physical activity within Indigenous health programs. Conventional instruments often fail in Indigenous contexts because they lack cultural relevance and can distort measurements related to traditional foods and activities. The main objective was to map and analyze assessment tools used in Indigenous contexts, emphasizing that their effectiveness depends on cultural adaptation, contextual validation, and community participation. The innovation of this review lies in synthesizing evidence on how these contextual factors influence the validity and reliability of measurement tools.

Methods: A systematic narrative review was conducted across PubMed, EBSCO, ScienceDirect, and Scopus. The search combined terms related to Indigenous health, dietary assessment, physical activity measurement, and cultural adaptation. Studies were included if they described the development, adaptation, or validation of tools used in Indigenous contexts. After a two-stage screening process (titles/abstracts and full texts) and a review of reference lists, 57 articles met the inclusion criteria from an initial 1,437 records. Data was extracted on tool type, validation process, and community participation to identify patterns and best practices in culturally grounded measurement approaches.

Results: The literature reveals a wide range of tools, including self-report questionnaires, community-developed instruments, and mixed-method approaches. Self-report tools remain the most common and practical, but require substantial adaptation to reflect traditional foods and activities accurately. While objective measures such as accelerometers enhance precision, they face logistical and contextual challenges. Overall, the evidence highlights that participatory, narrative-based (e.g., storytelling), and community-driven approaches represent best practices for achieving cultural validity and meaningful engagement.

Conclusion: The effectiveness of assessment tools in Indigenous health programs depends on cultural adaptation, contextual validation, and sustained community participation. Continuous engagement with Indigenous communities is essential to develop tools that authentically reflect Indigenous worldviews, lifestyles, and health priorities. Future research should prioritize the validation of digital tools and the systematic integration of traditional knowledge within health measurement frameworks to prevent the reinforcement of health inequities.

SO.1.08-03

Nothing for Us without Us: Engaging Child-headed Households in Co-creating Food Security and Nutrition Solutions through Participatory Research

A. Ritho¹, D. Osogo², D. Osuka², M. Hassan³, C. Kinyua⁴

¹Africa Population and Health Research Centre (APHRC) - ALEP Project - Kenyan (Advocacy for CHHs), Health and Wellbeing Theme (Nutrition and Food Systems Unit), Nairobi, Kenya, ²Africa Population and Health Research Centre (APHRC), Health and Wellbeing Theme (Nutrition and Food Systems Unit), Nairobi, Kenya, ³UN HABITAT, Mogandishu, Somalia, ⁴Institute of Food Justice and Development (IFJAD), Nairobi, Kenya

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion

Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Child-headed households (CHHs) are an emerging yet under-recognized crisis in urban informal settlements across Sub-Saharan Africa. Defined as households without an adult caregiver and led by the eldest child, CHHs often arise due to orphanhood, parental illness, incarceration, poverty, conflict, or displacement. These households are often excluded from nutrition and social protection programs. This study applied a participatory research approach

SHORT ORALS

to co-create locally relevant nutrition and livelihood solutions with CHHs in Korogocho, Nairobi, as part of a youth-led advocacy initiative under the Agrifood Leadership Education Programme.

Methods: A qualitative dominant mixed-methods design was employed, guided by a **phenomenological approach** to explore the lived experiences of 10 and 17-year-old children heading households living in the Korogocho informal settlement of Nairobi. A sample of 10 CHHs was engaged in a participatory action research process involving problem identification, solution co-creation, and validation with community and policy actors. The engagement methodologies used included digital storytelling, participatory dialogues, and a photovoice exercise capturing lived experiences of challenges in achieving food and nutrition security. Stakeholder roundtables facilitated dialogue between CHHs, local leaders, and youth-led community-organized groups to co-create and refine feasible interventions. Data were analyzed using a participatory thematic framework emphasizing voice, agency, and inclusion.

Results: CHHs articulated key challenges, including inconsistent food supply, low diet diversity, and exclusion from assistance programs. They also highlighted the lack of social protection that predisposes them to sexual exploitation, school dropouts, and early marriages. Through facilitated sessions, participants co-developed practical solutions such as household-level urban farming, group food vending enterprises, and education on nutrition and financial literacy. The process enhanced participants' confidence and sense of agency, fostering ownership of both problems and solutions. Stakeholders reported increased awareness of CHHs' resilience and expressed willingness to integrate their input into future food and nutrition programs.

Conclusion: Participatory research offers a powerful pathway for inclusion and empowerment of marginalized populations such as child-headed households. Engaging CHHs as co-creators rather than beneficiaries not only generates context-specific, sustainable solutions but also amplifies their policy voice within local food systems. Embedding participatory models within urban nutrition interventions can advance equitable, youth-driven food systems transformation.

SO.1.08-04

Arts and Audiovisual Media as Vectors of Mobilization among Indigenous Communities: A Pathway for Transformative Change in Mental Health Promotion in Post-pandemic Contexts

D. Bergeron¹, G. Vieira Posada², F. Murillo Salazar³, A.M. Michaud¹, E. Bédard¹, F. Ccaniahuire Laura⁴, W. Caniahuire Saire⁴, Y. Huaman Titio⁴, R. Ccoyo Quispe³, M. Yauri Zea⁵, O. Green Santacruz⁶, F. Chambes Arteaga⁶, Y. Espitia Cuellar⁶, C. Londoño Hernández², G.A. Sánchez Lamprea¹

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion
Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This study examines the learnings and challenges arising from the intercultural co-construction of a mental health promotion intervention with Quechua communities in Peru and the Gunadule community in Colombia. The project was part of a knowledge transfer and exchange (KTE) process that integrated visual and media arts as vehicles for community mobilization in post-pandemic contexts. It highlights the methodological innovation of the TECAC model—grounded in the arts and the Two-Eyed Seeing approach—and its participatory, adaptive implementation.

Methods: A qualitative multi-case study was conducted using a participatory and evaluative design. The process unfolded through six interconnected phases, beginning with the community conceptualization of mental health (Phase 0), followed by exploration, artistic co-creation, and process evaluation (Phases 1–4), and culminating in intercommunity exchange and feedback workshops (Phase 5). In each setting, we facilitated modified talking circles, interviews, artistic experimentation sessions, and co-creation cycles with adolescents, adults, and elders. Data were collected through participant observation, field notes, and audiovisual documentation, then analyzed through the lenses of realist evaluation and systems thinking.

Results: Grounding the process in community conceptualizations anchored mental health within local understandings of balance and *Buen Vivir*, reinforcing its cultural and spiritual dimensions. In both contexts, artistic practices—such as weaving, drawing, singing, and audiovisual storytelling—served as spaces for healing, intergenerational dialogue, and identity reaffirmation. Key success factors included the phased methodological structure, linguistic

SHORT ORALS

accompaniment (Quechua and Dulegaya), and the creation of community advisory committees. The process also fostered the emergence of a local audiovisual collective. Main challenges included geographic accessibility, gender equity in participation, and coordination across intercultural teams.

Conclusion: Integrating the arts within a KTE framework fostered active participation, cultural ownership, and community empowerment in mental health promotion. This experience offers transferable insights for Indigenous mental health initiatives using intercultural, arts-based, and participatory approaches—aligned with the principles of Indigenizing Wellbeing Research and Participatory Research in Health Promotion.

SO.1.08-05

Infant and Young Children Nutrition in EU Childcare Settings

A. Perez-Cornago¹, C.M. Jarach¹, E. Grammatikaki², A. Sarasa-Renedo³, J. Wollgast¹, P. Maragkoudakis¹

¹European Commission, Joint Research Centre, Ispra, Italy, ²European Dynamics, Milan, Italy, ³Trinitech Europe S.L.U., Madrid, Spain

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion

Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: This study aims to conduct a systematic assessment of the nutritional criteria in policies relevant to public food procurement in childcare settings (in children up to 3 years) across the European Union (EU), and to assess the extent to which the existing policies address essential nutritional aspects of infant and young children nutrition.

Methods: We identified existing policies (legislations, guidelines and recommendations) having nutritional criteria for childcare settings across the EU. Next, using dietary recommendations from international food- and health-related organisations for children up to 3 years, we identified key nutrients and food groups to be addressed. We then translated these recommendations into nutritional criteria suitable for public food procurement. Finally, we assessed how the identified national policies align with these nutritional criteria that we established for public food procurement. Each nutrient and food group was rated as „Yes“, „Partly“, or „No“, based on whether the policy fully met, partially met, or did not meet specific criteria.

Results: All 27 EU countries have food policies for childcare settings, with a total of 37 policies identified, including 17 voluntary and 20 mandatory policies. Three countries limit salt in childcare meals by avoiding high-salt foods and eight by not adding or carefully measuring salt during cooking. While 22 countries have some restrictions on free sugars, for example restricting some sugary products, only one country has comprehensive criteria restricting all free sugars, with sugary products, added sugars, and other free sugars, including juices, being restricted. Nine countries have criteria restricting non-sugar sweeteners. Moreover, 18 countries require daily offerings of fruits and vegetables, 16 require daily offer of animal foods, and some countries prioritize specific food groups, including whole grains (six countries), pulses (nine countries), and nuts and seeds (three countries).

Conclusion: Although several existing childcare food policies in the EU align with the infant and young children's nutritional criteria we established, gaps were found and improvements are needed to guarantee healthier meals in childcare settings. An update of these policies incorporating up-to-date dietary recommendations should be considered, with nutritional criteria that are comprehensive, specific, and fit for implementation into public procurement tenders.

SO.1.08-07

Exploring Methodologies across Disciplines to Decolonize Food Sovereignty Research in Urban Native American Communities in Minnesota

A. Hanratty¹, A. Evans¹, A. Crusan¹, M. McCue-Enser²

¹St. Catherine University, Nutrition & Dietetics, St. Paul, United States, ²St. Catherine University, Communication Studies, St. Paul, United States

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion

Room 7, May 28, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: The United States was founded on the marginalization of Indigenous peoples. Academia and healthcare organizations have perpetuated this harm by imposing Western ideals of white supremacy promoting individualism, perfectionism, and the categorization of people based on physical characteristics and socioeconomic status. This research was, in part, to understand use of traditional foods in urban Native American households in Minnesota, which led to the exploratory analysis of modeling Indigenous methods of relationality and reciprocity within research projects to avoid reinforcing systemic harm.

Methods: A team of four researchers in Nutrition/Dietetics and Communication Studies conducted a literature review in tandem with exploration of multi-media forms of oral history, personal stories by Native artists, and contemporary Indigenous literature. Dialogue among the research team to resemble the interconnectedness woven into Indigenous epistemology promoted weekly interprofessional discussions.

Results: Research shows committing to scholarly work involving Native American populations involves building a space of reciprocity. Best practices include but are not limited to: 1) conducting in-person work to foster relationship-building and facilitation of The Visiting Way –gathering for shared meals, respecting community values and individual contributions, perceiving without judgement, pausing to reflect, and expressing gratitude, 2) using semi-structured interview methods to allow for storytelling and conversational methods, and 3) utilizing an approach of Two-Eyed Seeing to encourage worldview through an Indigenous and Western lens. These practices can be evaluated through structured research practices and multimodal processes such as art, literature and storytelling. Qualitative data can be analyzed utilizing methods that compare and contrast collective stories to preserve the integrity of the shared relationships within the stories. Including a community review or ensuring representation across all aspects of the project also supports cultural relevance of project design and interpretations. Additionally, challenging the dominant structure of dissemination such as “standard” formatting and procedural process can also promote preservation of the situational context within the story.

Conclusion: By utilizing an interprofessional approach to understand Indigenous research methods via literature and traditional methods of storytelling and art, the dominant style of data collection and dissemination of findings is challenged to align more strongly to traditional Indigenous methods.

SO.1.08-09

Food Acculturation Patterns and Diabetes-related Health Risks among East African Immigrants. Preliminary Findings of a Pilot Study

H. Ibrahim¹, S. Ibrahim², A. Ekwonye³

¹St. Catherine University, Social Work, St. Paul, Minnesota, United States, ²St. Catherine University, Public Health, St. Paul, United States, ³St. Catherine University, St. Paul, Minnesota, United States

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion

Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Purpose: Using socioecological model, the study explores the multi-level protective and risk factors (individual, family, cultural and community) associated with food and dietary acculturation patterns, including food choices, availability, accessibility and affordability. The study focus on East African immigrants brings data on a minority group that exhibits high rates of overweight, obesity, and diabetes, yet remains underrepresented in academic research.

Methods: Data was collected through six focus groups (N=36) in the Spring, Summer, and Fall of 2025 among East African immigrant women, based on the premise that women are the primary food preparers for their households. All discussions were audio-recorded, transcribed verbatim, and cross-checked for authenticity. Data analysis involved a manual, systematic process. Two team members read and re-read each transcripts, generating initial codes. Codes were then refined, categorized, and organized in an Excel sheet to identify broader, validated themes, ensuring strong intercoder reliability and adherence to the participants' voices.

Results: Key Themes

Individual and family level Factors:

- Food choices and decisions – participants expressed a strong preference for ethnic foods, but also expressed fear of the unknown “*The food has different taste, different ingredients, difficult to buy food I don't understand*”. Religious and cultural dietary restriction is strong factor that influences the choice.
- Generational difference in preferences - while adults prefer to eat ethnic foods, the kids adjusted to and prefer American food, bringing cultural diet-clash into the households.

SHORT ORALS

- Lack of self-efficacy - unsustainable dietary change habit

Community-level factors:

- Availability – limited choices of ethnic stores and food make choices more difficult and **expensive**
- Access: **Transportation is** a barrier especially for new arrivals, compounded by unreliable public transport and unfamiliar weather patterns.

Conclusion: Factors that contribute to food acculturation are both personal and structural. The use of the **socioecological framework** allows for multi-level analysis moving behavioral nutrition knowledge beyond individual-centric models to recognize the role of structural and environmental factors. The generational difference in preferences, the „cultural diet-clash“ is significant for behavioral nutrition practice, which often target the individual or assume a unified household diet.

Addressing structural barriers that limit ethnic stores availability and transportation issues are significant policy implications

SO.1.08-10

Insights on Interventions and Policies to Promote Healthy Diets of Women and Children: A Participatory Photovoice Study in Urban Ethiopia

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion

Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: The coexistence of multiple forms of malnutrition in Ethiopia is a growing public health challenge that requires new interventions and policies. Poor-quality diets are a shared driver of multiple forms of malnutrition. Our study explored the lived experiences and realities of women of reproductive age (WRA) and their children under five (U5) in urban Ethiopia, identifying both the challenges they face and the solutions they propose for achieving healthy diets.

Methods: Qualitative participatory photography (Photovoice) was used among WRA from both deprived and wealthier neighbourhoods of Addis Ababa. Women were instructed to take photographs on the barriers they face to adopting healthy dietary behaviours for themselves and their children. Focus group discussions (n=5; 31 women) were held, where participants were asked to tell the stories of their photographs and discuss challenges and solutions to adopting healthy diets. A mix of approaches (data-driven and theory-informed) was used to identify emerging themes and subthemes, with comparisons across socio-economic groups.

Results: Across groups, women identified financial and physical barriers to accessing healthy foods, time constraints and concerns about food safety as major barriers. In more deprived groups, women also reported limited knowledge about healthy diets, inadequate family support, and poor home food environments. In wealthier groups, unhealthy food preferences coupled with easy access to and aggressive promotion of unhealthy foods were key challenges. Women from lower socio-economic backgrounds mainly expected government-led actions, whereas those from better-off households saw a role for society in driving change. Proposed government-level solutions included job creation, nutrition education, affordable healthy food, investment in household infrastructure, expanded childcare, and restrictions on unhealthy food availability and promotion. Societal-level solutions included promoting gender equality, strengthening community-based loan schemes, and supporting urban agriculture.

Conclusion: The findings show that women recognise their own needs and can identify who should support them, highlighting the importance of including women's voices in decision-making processes. The solutions proposed by women spanned multiple domains, sectors, and levels, reflecting women's understanding of the complex factors influencing dietary behaviours. Although the proposed solutions varied by socio-economic status, many could benefit all urban women and their families now or in the future.

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion

Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Following a healthy dietary pattern can reduce the dual burden of malnutrition, which is prevalent in the Galapagos islands. We used TIPS, a participatory approach involving potential participants in designing behavior-change strategies, to identify barriers and facilitators to meeting Ecuadorian dietary guidelines among families with young children living in San Cristobal.

Methods: We conducted 3 home visits (HVs) among 19 women with a child <2 years. During HV1, we assessed maternal diet using the Global Diet Quality Project's Diet Quality Questionnaire-Ecuador. During HV2, mothers were presented a brief nutrition lesson based on their diet assessment and chose a specific healthy eating practice to try (e.g., Eat 2 or more servings of non-starchy vegetables daily). HV3 occurred 3-5 days later, consisting of a semi-structured interview to elicit barriers and facilitators to implementing practices and ideas for co-designing a nutrition program on the island. Mothers received a bag of healthy groceries worth \$20 U.S. for each home visit.

Results: Mothers were motivated to try practices to lose weight—physical activity opportunities are perceived to be limited—and by high rates of obesity and diet-related chronic diseases in their family. Food availability and cost were consistently co-mentioned: variety may be available, but “healthy eating” is expensive. Nearly all struggled to reduce white rice, a staple; some paired smaller portions with more protein or vegetables, while others eliminated it to avoid conflict. Most felt they could sustain changes but planned flexible approaches (weekdays only, alternate days, or ‘cheat days’) to manage cost and preferences. Mothers welcomed a nutrition program, emphasizing their role in meal decisions but recommending inclusion of all family members since fathers “provide” and multi-generational families eat together. To encourage participation, they would share personal benefits (more energy, better digestion, weight loss) and environmental advantages (meatless meals). For delivery, they suggested combining WhatsApp/social media with in-person classes featuring nutrition education, hands-on learning, and cooking activities for all.

Conclusion: Using TIPS, we explored barriers, opportunities, and programming preferences for healthy diets among families with young children in the Galapagos. Findings may inform similar contexts in Latin America and small island nations.

SHORT ORALS

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Gestational diabetes mellitus (GDM) is increasingly prevalent and can cause adverse perinatal outcomes. In Quebec (Canada), delays in multidisciplinary care frequently leave individuals anxious, highlighting the need for reliable information available as soon as possible. This three-phases project aims to support individuals diagnosed with GDM at diagnosis by: 1) identifying informational needs of both patients and healthcare practitioners (HCPs) involved in GDM care; 2) co-developing a series of evidence-based web clips; and 3) evaluating its implementation in primary care.

Methods: Guided by the Knowledge-to-Action framework, Phase 1 used a qualitative approach using multiple data sources: (1) two focus groups with patient partners previously diagnosed with GDM (n=5); (2) two focus groups with healthcare professionals involved in GDM care (n=12); and (3) 258 anonymized posts published between January 10 and February 15, 2024, on an open-access, unmoderated Facebook support group for individuals with GDM. Focus groups were video-recorded, transcribed verbatim, and analyzed together with the posts using inductive thematic analysis in NVivo. Findings were validated through two additional focus groups with patient partners and HCPs, and informed the design of a series of web clips. Phase 2, ongoing, focuses on co-developing scripts and visuals for the web clips, through iterative review by patient partners, HCPs, and researchers. Phase 3, planned for February 2026, will evaluate usage and implementation in two primary care settings using a mixed-methods approach.

Results: Phase 1 identified recurring themes spanning lifestyle, clinical, and psychological aspects of GDM management. These informed the co-development of 12 evidence-based web clips covering core dimensions of GDM management, including understanding the condition, its management and consequences, nutritional guidance, and other lifestyle strategies to support glycemic control. Participants emphasized that nutrition should be discussed in several clips, being the cornerstone of first-line treatment while consistently raising questions among patients. They also recommended short (2-5 minutes), clear, and reassuring videos featuring diverse HCPs and patient testimonials to enhance credibility and engagement.

Conclusion: This participatory approach identified informational needs based on lived expertise of patients and HCPs to co-develop a series of evidence-based web clips on GDM, which will soon be released and implemented in primary care settings.

SO.1.08-13

Exploring Participant Experiences of HAT TRICK™ Cricket: A Culturally-adapted, Cricket Focused Health Promotion Intervention for Men with South Asian Backgrounds in Australia

C.M. Caperchione¹, N. Schulenkorf², S. Koparan¹, M. English¹, P. Sharp³, H. Sixsmith¹, L.M. Wood¹, P. Farhart⁴

¹University of Technology Sydney, School of Sport, Exercise and Rehabilitation and Human Performance Research Centre, Sydney, Australia, ²University of Technology Sydney, Business School, Sport Management, Sydney, Australia, ³University of New South Wales, School of Health Sciences, Sydney, Australia, ⁴Cricket New South Wales, Sydney, Australia

SO.1.08 Participatory Research in Health Promotion: Empowering Communities: Innovative Strategies for Food Security, Nutrition, and Health Promotion Room 7, May 28, 2026, 2:00 PM - 3:00 PM

Purpose: Individuals from culturally and linguistically diverse (CALD) backgrounds frequently experience complex health barriers arising from migration related factors such as accessing health services and cultural differences within their new communities. Men with South Asian backgrounds in Australia represent a group particularly affected by these intersecting factors in addition to gender-related influences. In this context, health promotion strategies must not only be culturally relevant but also engage critically with the gendered dimensions of health behaviour. In response HAT TRICK™ Cricket, a culturally-adapted health promotion intervention aimed at physical activity, healthy eating, and mental fitness, was designed for men with South Asian backgrounds in Western Sydney, Australia.

Methods: This study explores the experiences of men with South Asian backgrounds participating in HAT TRICK™ Cricket and their perceived outcomes to better understand how culturally tailored sport-based interventions can influence health behaviours, improve psychosocial wellbeing, and foster a greater sense of social connectedness. Semi-structured interviews (N=13) were conducted approximately two weeks following program completion.

Results: Three themes were inductively derived using reflexive thematic analysis, including 1) *Pursuing personal growth and mastery on and off the pitch* which highlighted opportunities for experiential learning, culturally meaningful

SHORT ORALS

engagement, and skill development that collectively enhanced participants' confidence, sense of competence, and motivation to improve; 2) *Finding commonality and social connection* in which participants perceived the program to foster meaningful interactions, facilitate the formation of new friendships, and strengthen existing relationships in a supportive environment that encouraged open and honest conversations extending beyond sport, and; 3) *Translating knowledge into everyday action* indicated that participants actively applied some of the skills and knowledge gained from the program to improve their daily physical activity, nutrition, and mental health practices.

Conclusion: These findings highlight the importance of 'layered learning' in health promotion programs, where knowledge is built progressively through expert input, peer engagement, and reflective practice. Further, these findings support the feasibility and value of culturally tailored sport-based health promotion programs and can inform future initiatives for CALD communities.

SO.2.09-01

Understanding Mealtime Priorities of Australian Parents with Children Aged 3 to 5 Years Old

H. Povall^{1,2}, K. Lacy¹, M. Mohebbi¹, C. Farrow², J. Blissett², C.G. Russell¹

¹Deakin University, Melbourne, Australia, ²Aston University, Birmingham, United Kingdom

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors
Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Low fruit and vegetable intake and low dietary quality in preschool children in Australia are key public health challenges. Parent mealtime priorities have been associated with both of these child outcomes. Prior research using rating scales has shown that parents are endorsing multiple mealtime priorities (e.g., nutrition, convenience), and therefore it is unclear how parents are trading off competing priorities at family mealtimes. This study aimed to determine the relative importance of parents' mealtime priorities by using a discrete choice experiment.

Methods: Parents ($n=96$) of three-to five-year olds living in Australia completed an online discrete choice experiment on Sawtooth. Participants were presented with 12 choice sets, each with three hypothetical mealtime alternatives, and were asked to select the mealtime scenario they would most and least likely choose with their child. Mealtime scenarios systematically varied in attributes and levels so that parents had to trade off competing priorities: *Price* (cheap, average, expensive), *Ease of preparation* (easy, medium, hard), *Child involvement in mealtime preparation* (yes, no), *Nutrition* (low, moderate, high) and *Your child's likely response* (accepting, neutral, resistant). Logit model analyses were used to determine relative importance and utility weights for each attribute.

Results: The attribute *Your child's likely response* was the most important mealtime priority (relative importance = 38.2%), followed by *Nutrition* (28.7%). *Price* (16.7%) and *Ease of preparation* (13.5%), with *Child involvement in mealtime preparation* (2.9%) the least important mealtime attribute. Parents preferred meals that children were accepting of (utility = 0.90, $p<0.001$) over meals that children would likely reject (utility = -1.2, $p<0.001$), and preferred meals that were high in nutrition (utility = 0.69, $p<0.001$) compared to low in nutrition (utility = -0.89, $p<0.001$).

Conclusion: Parents prioritised their child's likely response to a meal above other mealtime attributes. Prioritisation of their child's anticipated acceptance may be linked to leniency in offering favourite or familiar foods. Information about how to best support and educate parents with strategies for child food acceptance within nutritious mealtimes is needed. Future research could also explore how child eating behaviour e.g. diet quality and food avoidance traits are associated with parent's mealtime priorities.

Cross-sectional and Longitudinal Associations between Parental Mental Wellbeing and Adolescents' Physical Activity, Sedentary Digital Media Use, and Body Mass Index

L. Hietjärvi¹, E. Maksniemi¹, J. Lahti², K. Lonka¹, H. Viljakainen^{3,4}, E. Engberg^{3,4}

¹University of Helsinki, Faculty of Educational Sciences, Helsinki, Finland, ²University of Helsinki, Department of Psychology and Logopedics, Helsinki, Finland, ³Folkhälsan Research Center, Helsinki, Finland, ⁴University of Helsinki, Faculty of Medicine, Helsinki, Finland

SHORT ORALS

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The role of parental mental wellbeing in adolescent behaviours and body mass index (BMI) remains understudied. We aimed to 1) identify parental mental wellbeing profiles and 2) examine whether parental mental wellbeing, both as profiles and continuous measures, is associated with adolescents' leisure-time physical activity, sedentary digital media use, and BMI at ages 11 and 14.

Methods: The study included 5,839 parent-adolescent pairs (89% mothers, 51% girls) in a 3-year follow-up. At baseline (mean adolescent age 11 years), parents completed the Short Form Beck Depression Inventory, Sense of Coherence (SOC) Scale, and RAND-36 Mental Component Summary. Adolescents reported leisure-time physical activity and sedentary digital media use via questionnaire, and height and weight were measured to calculate BMI z-scores at baseline and follow-up (mean age 14 years). We identified parents' mental wellbeing profiles at baseline using latent profile analysis. We then examined associations between these profiles and adolescents' behaviours and BMI at ages 11 and 14 using the manual Bolck-Croon-Hagenaars approach. Profile differences were tested using Wald's omnibus and Bonferroni-adjusted pairwise z-tests. Post hoc structural equation models further assessed associations between parental wellbeing (as a latent higher order construct and individual latent variables) and adolescent outcomes. Sensitivity analyses adjusted for parental and child demographics.

Results: Latent profile analysis identified three parental mental wellbeing profiles: balanced (82%), somewhat balanced (13%), and unbalanced (5%). Better parental mental wellbeing, analysed as a continuous latent variable rather than as profiles, was associated with higher adolescent physical activity and lower sedentary digital media use on both weekdays and weekends at age 11. These associations persisted at age 14, more strongly for physical activity. Among individual wellbeing indicators, greater parental depressive symptoms were associated with lower adolescent physical activity, while higher parental SOC was associated with less adolescent sedentary digital media use. We observed no associations with adolescent BMI.

Conclusion: Better parental mental wellbeing was associated with higher adolescent leisure-time physical activity and lower sedentary digital media use. These findings highlight the potential of supporting parental mental wellbeing to promote healthier adolescent movement behaviours, contributing to behavioural health research and population-level prevention efforts.

SO.2.09-04

Prepregnancy BMI and Trajectories of BMI-for-Age in Children's Participants of the Brazilian Birth Cohort

T. Ramos Flores¹, B. Pereira Nunes¹, G. Iven Mielke², O. Amaral de Andrade Leao¹, C. dos Santos Costa³, R. Buffarini⁴, M. Rodrigues Domingues³, M. Freitas da Silveira³, A. Damaso Bertoldi³, P. C Hallal¹

¹University of Illinois, Health and Kinesiology, Champaign, United States, ²The University of Queensland, Brisbane, Australia, ³Federal University of Pelotas, Pelotas, Brazil, ⁴Federal University of Rio Grande, Rio Grande, Brazil

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Prepregnancy Body Mass Index (BMI) is associated with several gestational, perinatal, and child health outcomes, including overweight and obesity in the short, medium, and long term. Evidence suggests that children of mothers who had excess weight before pregnancy presented higher adiposity throughout their lives. This study aims to evaluate the association between prepregnancy maternal BMI and the BMI-for-age trajectories in children.

Methods: Longitudinal study used data from the 2015 Pelotas (Brazil) Birth Cohort Study. Prepregnancy BMI (kg/m²) was measured on the perinatal interview. Weight and height were measured by research assistants using standardized methods. The anthropometrists were trained and standardized by a gold standard for these measurements. BMI-for-age in z-scores was calculated according to the World Health Organization Growth Standards, using Anthro 2005 software. Z-scores of BMI-for-age were calculated for children at three months, 1, 2, and 4 years. Trajectories were identified using a semi-parametric group-based modeling approach. Multinomial logistic regression was used to investigate the association between prepregnancy BMI (defined as weight excess: BMI ≥ 25 kg/m²) and BMI-for-age trajectories.

Results: Of the 4,275 children in the original cohort, a total of 3,218 (75.3%) were included in the current study for having valid BMI-for-age data at three months, 1, 2 and 4 years and prepregnancy BMI data. Four trajectories of the BMI-for-age, in z-score, were identified and represent children in the "increasing," "adequate," "stabilized," and "risk for weight excess" groups. A total of 196 children (7.1%) belonged to the group that was at risk of weight excess. Adjusted analyses showed that children whose mothers presented prepregnancy weight excess had 2.36 (95%CI 1.71;

SHORT ORALS

3.24) times more risk of belonging to group “risk for weight excess” when compared to those children whose mothers presented underweight/normal weight before pregnancy.

Conclusion: The findings of this study confirm what was evidenced in the literature through a robust longitudinal analysis. The risk of weight excess in children up to 4 years of age was greater in mothers who presented prepregnancy weight excess.

SO.2.09-05

Beyond the Plate: How Caregiver Mealtime Goals Shape Food Parenting and the Mealtime Experience

N. Hogan¹, M. Barnard², J.A. Fulkerson³, J.O. Fisher⁴, K. Loth¹

¹University of Minnesota Medical School, Department of Family Medicine and Community Health, Minneapolis, United States, ²University of Minnesota, Division of Biostatistics and Health Data Science, Minneapolis, United States, ³University of Minnesota, School of Nursing, Minneapolis, United States, ⁴Temple University, Social and Behavioral Sciences, Philadelphia, United States

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors

Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The relationship between caregiver mealtime goals and food parenting practices has been assumed, but rarely examined. This study investigates how caregivers’ mealtime goals relate to their food parenting practices and perceptions of mealtime atmosphere, using ecological momentary assessment data.

Methods: Caregivers (n=252) of children (3–5 years) reported on food parenting practices they used, mealtime goals they prioritized, and their perception of mealtime atmosphere (grouped as negative or positive) at eating occasions (n=6,281 total) shared with their child across multiple days (M=9.23 days, SD=1.53). Four domains of food parenting practices were examined: *Structure, Coercive Control, Indulgence, and Autonomy Support*. Mealtime goals were grouped into: *Nutrition-Oriented, Connection-Oriented, Emotion-Oriented, and Task-Oriented*. Mixed effect models with random intercepts for each parent-child dyad were used to account for clustering within dyads across meal occasions.

Results: Nutrition- and connection-oriented goals were less likely to be associated with a negative mealtime atmosphere (i.e., caregivers more often rated the atmosphere as positive; nutrition: OR = 0.687; connection: OR = 0.444; both $p < .001$). These goals were also associated with greater use of structure (nutrition: $\beta = 0.486$; connection: $\beta = 0.909$; both $p < .001$) and autonomy support (nutrition: $\beta = 0.412$; connection: $\beta = 0.356$; both $p < .001$), and less use of indulgence (nutrition: $\beta = -0.116$, $p = .002$; connection: $\beta = -0.066$, $p = .042$). Emotion-oriented goals were related to lower odds of a negatively rated atmosphere (OR = 0.762, $p = .003$) and higher structure ($\beta = 0.427$, $p < .001$), but also greater indulgence ($\beta = 0.131$, $p < .001$). Task-oriented goals were associated with higher odds of a negatively rated atmosphere (OR = 2.666, $p < .001$) and higher use of coercive control. ($\beta = 0.039$, $p = .039$).

Conclusion: Caregivers endorse a range of mealtime goals and employ a variety of parent feeding practices. Findings indicate that caregivers’ mealtime goals shape both their parenting approach and their perception of mealtime atmosphere. These results underscore the importance of helping parents reflect on and intentionally select mealtime goals, as doing so may promote more positive mealtime experiences and support healthier family eating dynamics.

SO.2.09-06

Mindless Media: How Automaticity of Parents’ Phone Use Relates to Children’s Digital Behavior and Habits

B. Armstrong¹, J. Culverhouse¹, K. Bowen¹, M. Restino¹, T. Adair¹, O. Finnegan¹, A. Rebar¹, M. Savidge¹, G. Randolph¹, J. White¹, K. Kiely¹, A. Holmes¹, S. Burkart¹, E. Adams¹, R.G. Weaver¹, M. Beets¹

¹University of South Carolina, Columbia, United States

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors

Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Most research on digital media use focuses on the amount of *time* parents and children spend on devices. Less is known about *how* parents use their phones (whether deliberately or out of habit) and how these patterns shape

SHORT ORALS

children's own digital use and habit strength. This study addresses that gap by investigating how both the amount and automaticity (i.e., mindless or habitual nature) of parents' phone use are associated with children's media use.

Methods: Participants were 204 preschoolers (ages 3–5) and their parents. Over 14 days, parents completed ecological momentary assessments including 4-item assessments of habit strength for their own and their child's media use and provided objective personal phone and their child's tablet data (via *Chronicle* or iOS Screen Time). Data was analyzed using bootstrapped mixed-effects mediation models, with person-mean centering to distinguish between-person and within-person (daily) effects.

Results: Parents used their phones for an average of 408.2 minutes per day (SD=168.9), and children used tablets for 118.1 minutes (SD=129.9). Parents with stronger habitual phone use tended to have more use overall ($B=20.8$, 95%CI [3.23 to 38.39]) and had children with stronger digital media habits ($B=0.20$, 95%CI [0.09 to 0.31]). The strength of parents' phone habits was indirectly associated with children's digital media use through parents' own phone use (indirect effect = 4.07, 95% CI [0.32, 9.56]) and through children's habit strength (indirect effect = 10.08, 95% CI [3.78, 18.34]). This pattern did not hold at the daily level: on days when parents' habits were stronger, their child's habits were stronger too ($B=0.16$, 95%CI [0.11 to 0.21]), but parents' habit strength was not related to parents' phone use or children's tablet use that day.

Conclusion: Children appear to model not only *how much* their parents used digital media, but also *how* automatically they use it. This relationship appears to reflect co-varying stable or slow-to-change patterns rather than acute fluctuations. By considering stable habits as well as day-to-day variation in behavioral regulation, this study clarifies how media behaviors take root within families and suggests avenues for supporting more deliberate and healthy technology use.

SO.2.09-07

Generational, Psychological, and Environmental Influences on Hispanic Family Nutrition: Insights from the La CASA Study

J. Rodriguez¹, E. Feliciano¹, A. Pham¹, M. Rojo¹

¹University of Arkansas for Medical Sciences, College of Nursing, Little Rock, United States

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors
Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Childhood obesity is a major public health concern in Arkansas, where 52.9% of Hispanic students are classified as overweight or obese, higher than African American (48.4%) and Caucasian (38.4%) peers. Addressing these disparities requires culturally responsive, family-based interventions. To inform the La CASA program, a culturally tailored, faith-based obesity intervention, we conducted interviews with Hispanic mothers for curriculum development. Beyond their learning interests, new themes emerged during analysis. This study reports unanticipated findings and describe how they were considered and incorporated into La CASA curriculum to enhance cultural relevance and family engagement.

Methods: A qualitative exploratory design guided this pilot study. Thirty Hispanic mothers (≥ 18 years) who had at least one child aged 5–16 years were recruited through purposive and chain-referral sampling from faith-based organizations serving Hispanic congregants across Arkansas. Participants were primarily Mexican (87%), aged 31–50 years ($M=41$), married (80%), employed (63%), completed high school (70%) and household incomes below \$40,000. Semi-structured interviews were conducted in Spanish, transcribed verbatim, translated into English, and analyzed inductively using Braun and Clarke's thematic approach in MAXQDA. Themes were refined through iterative team discussions and analyst triangulation.

Results: Three key themes were identified: (1) Between Two Cultures: Mothers challenges balancing traditional cultural values with their children's adaptation to U.S. norms, which affected family meals, and efforts to model healthy behaviors. (2) Reflections of Self: Mothers observed that concerns about body image emerged as children entered school where appearance and peer influence gained importance. These experiences influenced children's psychological well-being, caregiving, and family eating patterns. (3) Competing Influences at School: Mothers cited school environments offered limited variety and reliance on convenient, highly processed, and flavorful foods, along with widespread availability of sugary drinks and social influence from peers that reinforced unhealthy eating habits.

Conclusion: These findings highlight the importance of addressing psychological, generational, and environmental factors that shape family-nutrition practices. These themes should be considered when developing culturally tailored healthy-eating programs to enhance their relevance, cultural alignment, and sustainability. Incorporating these concepts into interventions such as La CASA strengthen program success, participation and long-term impact among Hispanic families in Arkansas.

SHORT ORALS

SO.2.09-08

The Right Dose of Data: Balancing Reliability and Participant Burden in a Validated Daily Measure of Food Parenting Practices

O. De-Jongh González¹, L.C. Mâsse¹

¹University of British Columbia, School of Population & Public Health, Vancouver, Canada

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors
Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Intensive longitudinal methods are increasingly used to capture daily fluctuations in food parenting practices (FPP), yet reliable tools for daily assessment remain limited. Most studies rely on a fixed recall period for all constructs, but the reliability of this approach is unclear. Determining the minimum number of assessment days required can improve the feasibility and quality of daily FPP research.

Objectives: To 1) assess the test-retest reliability of daily FPP measures among mothers and fathers over a 14-day period, 2) estimate the minimum number of days needed to achieve adequate reliability, and 3) validate these estimates using a second 14-day period.

Methods: Parents (n=315, age 40±5 years; 60% mothers) of 2.5-6-year-olds completed 28 daily assessments across two 14-day periods, three months apart, yielding 8,820 observations. Seven FPP constructs were assessed daily using 13 binary items, and validity evidence was obtained via Confirmatory Factor Analysis. Intraclass correlation coefficients (ICCs) were calculated from mixed-effect models using data from the first 14-day period. The Spearman-Brown formula estimated the number of days required for ICC≥0.70, which was validated using random subsets of consecutive and non-consecutive days from the second assessment period.

Results: ICCs ranged from 0.80-0.97 in the first period. Required days for acceptable reliability varied by construct: Coercive control (1 day); Autonomy support, Child involvement, and Meal routines (5-6 days); and Rules and limits, Nondirective support, and Healthy opportunities (8-9 days). Compared to fathers, mothers required fewer days to reliably assess Rules and Limits, Healthy Opportunities, Autonomy and Nondirective Support. Validation analyses confirmed ICCs≥0.70 for most constructs, though Healthy opportunities, Nondirective support, and Child involvement had borderline ICCs (0.63-0.68) in some subgroups and sampling approaches.

Conclusion: This study provides a valid and reliable instrument to assess FPP in Daily Diary protocols. Although 14 days ensures high reliability, many FPP constructs can be reliably assessed with fewer days. Tailoring diary duration by construct and caregiver sex can reduce participant burden while maintaining measurement quality.

SO.2.09-10

Parental Screen Time Rules and Norms in Early Childhood and their Association with Children's Screen Time Six Years Later: A Prospective Study from Finland

J. Kailaheimo-Björkqvist^{1,2}, R. Lehto^{1,3}, J. Rahkola¹, H. Launistola¹, N. Serasinghe^{1,3}, H. Vepsäläinen³, M. Maukonen¹, I. Tillman^{3,1}, E. Roos^{1,4,5}, N. Sajaniemi⁶, M. Erkkola³, C. Ray^{1,3}

¹Folkhälsan Research Center, Helsinki, Finland, ²University of Aberdeen, Institute of Applied Health Sciences, Aberdeen, United Kingdom, ³University of Helsinki, Department of Food and Nutrition, Helsinki, Finland, ⁴University of Helsinki, Department of Public Health, Helsinki, Finland, ⁵Uppsala University, Department of food studies, Uppsala, Sweden, ⁶University of Eastern Finland, School of Applied Educational Science and Teacher Education, Joensuu, Finland

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors
Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Excessive childhood screen time is associated with negative health outcomes and development, increased sedentary time and decreased physical activity. Early childhood is a key period when screen habits form and we examined whether parental rules and norms in early childhood were associated with children's leisure-time screen time at school age.

Methods: In this prospective 6-year follow-up study (DAGIS Salo) we used data from 173 parent-child dyads. Baseline data were collected in 2017 (children aged 3-6 years) and follow-up in 2023-2024 (9-12 years). At baseline, parents reported screen use rules with six 5-point Likert items (limits, timing, duration, child awareness, mealtime use and

SHORT ORALS

screen device visibility), averaged to a composite score (higher=more restrictive). Parental importance of limiting screen time was assessed with a single 5-point Likert item. Descriptive norms were measured as parents' open-ended reports of a suitable maximum daily screen time for 3–6-year-olds on weekdays and weekends, converted to minutes. At follow-up, children self-reported weekday and weekend leisure-time screen time using the SCREENS-Q instrument. Weighted weekly minutes/day were derived and log-transformed to reduce skewness. Associations between early parental rules and norms and later screen time were examined using linear regression adjusted for child sex, baseline age and parental education.

Results: More permissive parental descriptive norms at preschool age were associated with higher leisure-time screen time at school age, for both weighted weekly ($B=0.003$, 95% CI 0.001–0.006; $p=0.016$) and weekday screen time ($B=0.003$, 95% CI 0.000–0.007; $p=0.035$). Each additional 30 minutes of weekday screen time parents considered suitable at preschool age was associated with approximately 10% higher weekday screen time at school age. There was no association for weekend screen time. Parental importance of limiting screen time and screen rules at preschool age were not associated with screen time at school age.

Conclusion: Parental norms about acceptable screen time, rather than explicit rules or perceived importance, associated with children's subsequent screen time, although effect sizes were small. Public health policy and interventions should prioritise shifting parents' norms regarding acceptable weekday screen exposure in the preschool years, alongside providing guidance on screen time rules.

SO.2.09-11

Eat up! Discursive Practices Involving “Finishing the Plate” Talk during Family Mealtimes in the Netherlands, Italy and the United Kingdom

A. van der Heijden¹, V. Colla², S. Wiggins³

¹Vrije Universiteit Amsterdam, Department of Health Sciences, Amsterdam, Netherlands, ²University of Bologna, Department of Education Studies “Giovanni Maria Bertin”, Bologna, Italy, ³University of Linköping, Department of Behavioural Sciences and Learning, Linköping, Sweden

SO.2.09 Children and families: Family-Centered Approaches to Child Nutrition and Physical Activity Behaviors
Auditorium, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Family mealtimes comprise a common site for socialising children into eating practices, including at times eating up or finishing all the food on their plate. Finishing one's plate has individual nutrition and health outcomes, as well as economic and environmental implications. ‘Finishing the plate’ practices in family mealtimes have previously been studied as individual behaviours or as decontextualised linguistic items. This study therefore focuses on an underexplored phenomenon: interactional details of how parents and children orient to and construct the rule of ‘eating up’ or ‘finishing the plate’ in family mealtimes.

Methods: The data corpus comprised video recordings of 187 family meals across the Netherlands (ten families, 79 meals), Italy (six families, 28 meals), and the United Kingdom (three families, 80 meals). Recordings were analysed using specific forms of discourse analysis, i.e., discursive psychology and conversation analysis – qualitative, inductive methodologies for the analysis of real-life talk-in-interaction. Systematic and detailed analyses of 182 instances of ‘eating up’ and ‘finishing the plate’ across the data corpus resulted in the identification of four dominant discursive practices deployed by parents and children.

Results: Discursive practices identified include:

- (1) directives to eat up from parents to children;
- (2) orientations to ‘finishing the plate’ as a rule that is prioritised over and consequential to something else;
- (3) self-focused statements by children that they have finished; and
- (4) other-focused statements by parents that their children have finished.

Conclusion: The analysis demonstrates how discursive practices surrounding ‘eating up’ and ‘finishing the plate’ are common across three cultural settings, accomplish particular and sometimes contradictory social actions, and shape the socialisation of children into normative eating practices as a collaborative achievement in a multidirectional interactional process. Deployed discursive practices have implications not only for food consumption but also for how children are socialised into eating habits. As such, the study contributes to research on children's eating practices and language socialisation. Moreover, the study has practical implications for enhancing adequate nutrition intake as well as the reduction of plate waste in everyday settings, which are highly relevant within the contemporary focus on global climate and sustainability.

SO.2.10-01

The Potential Impact of Artificial Intelligence Data Centers on Household-level Food and Water Insecurity in Lower Income Communities: A Conceptual Framework

M.P. Chaparro¹, S.M. Collins², E.Y.W. Seto³

¹University of Washington School of Public Health, Health Systems and Population Health, Seattle, United States, ²Tulane University Weatherhead School of Public Health & Tropical Medicine, International Health and Sustainable Development, New Orleans, United States, ³University of Washington School of Public Health, Environmental and Occupational Health Sciences, Seattle, United States

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The rapid global adoption of generative artificial intelligence (AI) is transforming daily life, but this technological shift carries significant environmental costs. Generative AI requires massive data centers to handle computational demands. These data centers use vast amounts of resources including land, electricity (to power computer servers), and water (to prevent server overheating), and contribute to environmental degradation through e-waste production and greenhouse gas emissions. The downstream impacts on food and water insecurity for households living in close proximity to data centers is currently understudied. The purpose of this study is to develop a conceptual framework linking AI data center development with household food and water insecurity in lower income communities.

Methods: A comprehensive literature review on potential pathways linking AI data centers with household-level food and water insecurity, including literature linking large industrial projects to nearby communities' nutrition and health outcomes, was conducted between March-October 2025. Information obtained from key-informant interviews with experts across relevant fields, planned for Jan-Mar 2026, will be incorporated into the conceptual framework.

Results: AI data center development is hypothesized to contribute to household-level food and water insecurity via four interrelated pathways: 1) **Land use.** The use of land for data center infrastructure may reduce land available for agriculture and housing, increasing food and housing prices. 2) **Energy use.** Increased energy demand may strain power grids, reducing domestic electricity reliability and increasing prices. 3) **Water use.** Competition for water between data centers, agriculture, and households may reduce water availability and crop yields, increasing food and water prices. 4) **Waste production.** E-waste and other byproducts may contaminate soil, waterways, and reservoirs, further reducing access to safe food and water and leading to an increase in food and water prices.

Conclusion: As AI data centers' construction accelerates globally, there is an urgent need to anticipate and mitigate their burden on the nutrition and health of vulnerable populations, particularly in lower income communities.

SO.2.10-02

Mapping the Digital Marketing Techniques Embeeded within Online Food Retail Platforms: A Scoping Review

A. Gupta¹, K. Huggins¹, S. Salahshoorneshad¹, R. Bennett¹, K. Backholer¹, A. Peeters^{2,1}

¹Deakin University, Institute for Health Transformation, Melbourne, Australia, ²Victorian Health Promotion Foundation, Melbourne, Australia

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Online food retail platforms (online food delivery, online grocery and meal kits) use a range of marketing techniques to promote unhealthy foods (food that are energy-dense and nutrient-poor) to influence consumers' food choices and food purchases. However, existing literature on this topic is dispersed (across public health and marketing disciplines) and has not been synthesised from a public health perspective. The aim of this review was to synthesise the evidence on the digital marketing techniques prevalent on online food retail platforms, what food products they promote and their potential influence on consumer's online food purchase behaviours.

Methods: A mix of health and business databases (Medline Complete, Web of Science, Business Source Complete, Communication and Mass Media Complete, and ABI/Inform) were searched for peer-reviewed papers published in

SHORT ORALS

the last ten years. Included studies were mapped to a pre-defined list of digital marketing techniques, marketing mix strategies and across Cialdini's principles of persuasion. All findings were described narratively.

Results: A total of 3408 studies were screened, of which 16 were included in the review. Eleven studies examined online food delivery services, and five studies examined online grocery retail services. A range of well-established digital marketing techniques were identified, including algorithmic personalisation, push notifications, membership-based models, interactive tools such as sorting and filtering features, hyperlinks or prompts to create combo deals, site customisation offering personalised shopping experience, clickable banner advertisements, and search engine optimisation. While these are standard techniques in digital commerce, we found that they often deployed to promote nutrient-poor foods. Specifically, seven studies highlighted the use of these marketing techniques to promote foods of poor nutritional quality, with marketing strategies reinforcing perceptions of value, tastiness and pleasure. Only two studies examined and reported a positive influence of using price promotion techniques on consumers' unhealthy food purchase intention.

Conclusion: Online food retail platforms use a range of digital marketing techniques to deliver content in highly persuasive ways, often promoting unhealthy food options. Future research should explore how these platforms can be leveraged to enable healthier population food choices and align with public health objectives.

SO.2.10-03

Developing a Policy-relevant Definition for Ultraprocessed Foods

L. Smith Taillie^{1,2}, D. Miles¹, B. Hollingsworth¹, A. D'Angelo Campos¹, J. Krieger^{3,4}

¹University of North Carolina, Chapel Hill, Carolina Population Center, Chapel Hill, United States, ²University of North Carolina, Chapel Hill, Department of Nutrition, Chapel Hill, United States, ³Healthy Food America, Seattle, United States,

⁴University of Washington, Department of Health Systems and Population Health, Seattle, United States

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The rapid proliferation of policies targeting ultraprocessed foods (UPFs) urgently requires a standardized, science-based definition that can be easily implemented. Previously, many researchers have used the Nova classification system to identify UPFs. However, the time and resource-intensive protocol for identifying products as UPFs (i.e., Nova category 4) highlights the need for a more streamlined approach. In addition, some policymakers may wish to narrow the set of products considered UPF for food access and equity reasons, or to exempt foods traditionally considered as healthy. We developed a set of simplified UPF definitions based on ingredient markers as well as potential policy exemptions to compare to the full Nova 4 definition.

Methods: Packaged foods and beverages in the US Mintel Global New Products database (n=92,727 products between 2018-2024) were identified as UPFs using Nova-linked ingredients markers. We examined how the proportion of products identified as UPF and thus subject to policy action changes if the definition is modified to include only those: 1) containing specific cosmetic additives; 2) included in select food groups; or 3) exceeding nutrient thresholds for high fat, sugar, and sodium (HFSS) according to the Pan American Health Organization [PAHO] or US Food and Drug Administration [FDA]. Among traditionally healthy food categories (bread, yogurt, ready-to-eat cereal), we also examined the percent of UPFs meeting the FDA's "healthy" definition as a potential criterion for UPF policy exemption.

Results: Of all foods and beverages, 75% were classified Nova 4, compared to a definition based solely on cosmetic Nova additives (74%) and one using solely sweeteners, flavors, and color (62%). While 69% of products met both Nova 4 and PAHO-HFSS criteria, only 45% met both Nova and FDA-HFSS criteria. Among breads, cereals, and yogurts, most (83%-92%) were Nova 4 UPFs, and of these, a small proportion would be exempt under the FDA "healthy" definition (4%-14%).

Conclusion: Using Nova 4, 75% of the US food products are UPF. A more streamlined definition for UPF using fewer ingredient markers captures most Nova 4 products. Using HFSS content or FDA "healthy" criteria could allow policymakers to narrow the set of foods subject to a given UPF policy.

Identifying Key Stakeholders and Priority Interventions and Policies to Tackle the Double Burden of Malnutrition in Ethiopia: A Mixed-methods Participatory Study

M. Worku^{1,2}, T. Genye³, M. Holdsworth⁴, M. Ruel⁵, K. Baye^{1,6}, M. Tessema⁷, A. Samuel⁷, A. Nag⁸, A. Irache⁹, N. Bricas⁴, R. Pradeilles^{4,10}

¹Addis Ababa university, Center for Food Science and Nutrition, Addis Ababa, Ethiopia, ²Menelik II Medical and Health Science College, Human Nutrition, Addis Ababa, Ethiopia, ³International Food Policy Research Institute, Addis Ababa, Ethiopia, ⁴Montpellier Interdisciplinary Centre on Sustainable Agri-Food Systems (IRD), Montpellier, France, ⁵International Food Policy Research Institute, Washington, United States, ⁶Research center for Inclusive Development in Africa (RIDA), Nutrition and food systems division, Addis Ababa, Ethiopia, ⁷Ethiopian Public Health Institute (EPHI), Addis Ababa, Ethiopia, ⁸Systems Change Consultant, Washington, United States, ⁹Universidad Autónoma de Madrid, Nursing, Madrid, Spain, ¹⁰International Food Policy Research Institute, Nutrition, Diets & Health Unit (NDH), Washington, United States

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments
Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Ethiopia is experiencing a double burden of malnutrition (DBM), with undernutrition and overweight/obesity co-existing. Current nutrition interventions and policies need to address the DBM using ‘double-duty actions’ (DDAs) identified by the World Health Organization. This study aimed to appraise key stakeholder views on priority DDAs for Ethiopia; and to identify key stakeholders to implement them at the national level.

Methods: We engaged 85 stakeholders from government, academia, United Nations/donors, nongovernmental organisations (NGOs)/civil society, and the private sector and used mixed- methods:

- 1) **a survey** of stakeholders (n=45) to rank 10 DDAs based on perceived impact, feasibility, social acceptability and cost;
- 2) **in-depth interviews** (n=20) using *multi-criteria mapping* (MCM) to select top 5 DDAs; and
- 3) **Net-Mapping** (2 focus groups (n=20)) to identify networks of key stakeholders and their linkages, support and influence in shaping and implementing DDAs. Quantitative MCM analysis generated overall rankings, which were complemented by thematic analyses of stakeholders’ justifications. Net-Mapping metrics were generated and combined with qualitative insights on stakeholders’ roles and interactions, including stakeholders’ reflections on the network and suggestions for implementing DDAs.

Results: Rankings of the emerging top 5 DDAs were consistent across stakeholder groups. Policies/interventions on breastfeeding (BF), maternal nutrition, and nutrition-sensitive agriculture (NSA) were prioritised, whereas anthropometric monitoring and school feeding programmes ranked lowest. BF programmes were valued for their perceived life-saving potential, cost-effectiveness and cultural acceptance. School feeding programmes ranked lowest due to perceived high implementation costs, logistical challenges and limited government prioritisation. Stakeholder network analysis revealed a multifaceted funding and information-sharing ecosystem, with the government playing a central role, extensive donor reach, and active NGO engagement. Differing perspectives across sectors were mainly driven by mandate and ownership.

Conclusion: BF, maternal nutrition, and NSA programmes were identified as priority DDAs to address the DBM in Ethiopia. Several highly influential stakeholders recognise the importance of tackling the DBM with DDAs, providing opportunities to leverage commitment and implementation expertise. Overlapping mandates and competing interests across sectors remain a challenge, highlighting the need for coordinated strategies to maximise the implementation and impact of priority DDAs.

SO.2.10-05

“It Feels Like They’re Pushing Us to Eat Unhealthy Stuff”: Adolescents’ Interactions with Online Food Delivery Apps in Three Southeast Asian Countries

C. Gomez-Donoso^{1,2}, S. Akhter¹, T. Scapin¹, A. Gupta¹, A. Cameron¹

¹Deakin University, Melbourne, Australia, ²Open University of Catalonia, Barcelona, Spain

SHORT ORALS

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The retail food environment is rapidly evolving globally, with online food delivery (OFD) services becoming increasingly popular. However, not much is known on how adolescents engage with OFD apps and how the apps influence their food purchasing behaviours. This study aimed to explore adolescents' perceptions of and interactions with OFD apps in three Southeast Asian countries.

Methods: We facilitated focus group discussions to explore adolescents' perceptions about OFD apps and their influence on purchasing behaviours in Indonesia, Malaysia, and the Philippines. The total sample included 91 participants aged 16-19 years who used OFD apps at least once a week. Focus groups were assessed through thematic analysis based on six major themes: 1) Motivations for use, 2) Product availability and order preferences, 3) Purchasing behaviours and decision-making, 4) OFD app features, marketing practices and personalisation, 5) Influence on eating habits and healthiness and 6) Suggestions to improve the healthiness of OFD apps.

Results: Price-based marketing strategies and convenience were the main factors driving the use of OFD apps and had a direct influence on purchasing behaviours, often resulting in unhealthy food purchases. It was evident that adolescents use OFD apps during school hours, which is especially concerning. Participants described being drawn to promotions through push notifications (i.e., targeted messages sent directly to users' devices even when the app is not actively open) and social media, and making food decisions based on discounts and prominent placement (e.g., what appeared first on the app). Purchasing behaviours were also driven by personalisation features, which often encouraged repeat purchases. Participants across countries expressed frustration with the lack of healthy options on OFD apps. Even when healthy meals were available, they were often more expensive and not included in promotional deals. Overall, participants demonstrated a strong interest in adding app features, including nutritional information, to support healthier diets.

Conclusion: Given the increasing popularity of OFD apps among adolescents and young adults globally, these findings underscore the need to monitor and regulate online retail food environments and can be used to inform priority actions to improve the healthiness of OFD apps.

SO.2.10-07

Comparison of Healthy and Unhealthy Food and Beverage Prices at Street Food Outlets around Public Schools in Mexico City

C. Medina¹, U. López¹, C. González¹, T. Aburto², J.C. Salgado², S. Barquera³

¹National Institute of Public Health, Physical Activity and Healthy Lifestyles, Mexico City, Mexico, ²National Institute of Public Health, Mexico City, Mexico, ³National Institute of Public Health, Cuernavaca, Mexico

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: To compare the prices of healthy and unhealthy products sold at street food outlets near elementary schools.

Methods: Street food outlets located around public schools in Mexico City were identified. Each vendor reported their best-selling food and beverage items and usual prices, and trained personnel measured each product. Reported products were classified as *healthy* (plain or mineral water, natural fruit and vegetable juices, sugar-free beverages, preparations without meat or processed meats, fruits, vegetables, cereals with or without dairy, unsweetened yogurt) or *unhealthy* (ultra-processed beverages with added sugar, homemade drinks with added sugar, alcoholic beverages, preparations with red or processed meats, deep-fried foods, sweets and desserts, bread and pastries, fried salty snacks, and other ultra-processed products, yogurt with added sugar). All prices were standardized to 100 grams or milliliters. Because price data were not normally distributed, square transformations were applied prior to performing independent t-tests to compare mean prices between groups.

Results: A total of 1,028 food and beverage items were identified across 378 outlets. The most frequently sold groups were preparations without meat or processed meats (20.7%), bread and pastries (10.9%), preparations with red or processed meats (10.1%), sweets and desserts (8.9%), and ultra-processed beverages with added sugar (7.3%). The mean price per portion of healthy foods was significantly lower than that of unhealthy items (Mexican pesos \$17.6 vs \$19.9 per 100g/ml; $p < 0.05$). Fruit and vegetables were among the least expensive per 100g, whereas candies were the most expensive. No significant price differences were found between beverage categories.

Conclusion: Contrary to the common perception that healthy foods are more expensive, this study found that, when compared using a standardized unit, healthier options sold at street food outlets around schools were generally

SHORT ORALS

cheaper than unhealthy alternatives. These findings highlight an opportunity to promote healthier food choices in school environments and to design public health strategies that engage existing street food outlets to support better nutrition among children.

SO.2.10-08

Associations between Neighborhood Segregation and Crime Incidents at Urban Supermarkets in Baltimore, Maryland and Washington, D.C

G. Headrick¹, A. Maybank², C. Singleton³, U. Colón-Ramos⁴, K. Fong²

¹Milken Institute School of Public Health, George Washington University, Exercise and Nutrition Sciences, Washington DC, United States, ²Milken Institute School of Public Health, George Washington University, Environmental and Occupational Health, Washington DC, United States, ³Celia Scott Weatherhead School of Public Health & Tropical Medicine, Tulane University, Social, Behavioral, and Population Sciences, New Orleans, United States, ⁴Milken Institute School of Public Health, George Washington University, Global Health, Washington DC, United States

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments
Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: For over a decade, U.S. cities have offered financing incentives to attract supermarkets to historically segregated neighborhoods facing food apartheid. In Baltimore, MD and Washington, D.C., these efforts have had mixed results. Recently, operators have warned of closures, citing crime near stores as a major factor, which threatens progress in disinvested areas. This study quantifies supermarket crime in Baltimore and D.C. (2020–2024) and examines its relationship to neighborhood segregation and surrounding crime.

Methods: Police-reported crime data (2020–2024) were obtained from open data portals for both Baltimore and D.C. Supermarket locations were geocoded, and circular buffers of 50 meters (immediate surroundings) and 400 meters (broader context) were applied to capture crime proximity to supermarkets. Neighborhood segregation was measured using the Index of Concentration at the Extremes (ICE) at the census tract level, defining advantage as majority white and high-income (80th percentile) and disadvantage as majority Black and/or Latino and low-income (20th percentile). Spatiotemporal negative binomial regressions for each city assessed associations between crime incidence at supermarkets, crime within 400 meters, and segregation, controlling for year.

Results: From 2020–2024, crime within 50 meters of supermarkets totaled 1,927 incidents across 48 supermarkets in Baltimore and 7,048 incidents across 74 supermarkets in D.C. Preliminary models suggest that in Baltimore, each unit increase in ICE (greater advantage) is associated with a 63% reduction in supermarket crime ($p < 0.01$). In D.C., the reduction is 18.5%, but not statistically significant ($p > 0.05$). Surrounding crime within 400m is significantly associated with crime at supermarkets in both cities, though the effect is minimal (2% increase in Baltimore, 3% increase in D.C.; $p < 0.0001$).

Conclusion: This analysis suggests addressing food apartheid requires more than investment in healthy food retail alone. Crime at supermarkets may reflect deeper gaps in structural and social support in disadvantaged areas. Addressing these gaps calls for complementary investments such as improvements to the physical environment (e.g., lighting, streetscapes, transportation), expansion of social infrastructures (e.g., food assistance programs, workforce development), and community safety strategies that prioritize cohesion over punishment. Future analyses will explore how these investments can enhance food access initiatives and promote neighborhood wellbeing.

SO.2.10-09

Food Exposure in Moving Populations Based on in-Vehicle GPS Data: A Case Study of Changsha, China

K. Peng¹, X. Li¹, L. Li¹, Y. Hu¹, Y. Mi¹, D. Guo¹, J. Liao¹, Y. Zhou¹, Y. Liang²

¹Hunan University, Urban and Rural Planning, Changsha, China, ²School of Urban Design, Wuhan University, China

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments
Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: While poor diet is a leading cause of disease and mortality worldwide, existing studies—primarily from

SHORT ORALS

Western contexts—often yield inconsistent conclusions regarding the impact of low-quality food environments, such as those dense with fast-food outlets, on dietary health. Most research focuses exclusively on static residential food environments, neglecting the role of daily mobility. This study addresses this gap by examining how individuals' exposure to restaurants during daily travel, along with the built environment of activity locations, influences restaurant choice in Changsha, China.

Methods: Using GPS trajectory data from 1,748 frequently used private cars in Changsha, Hunan Province, we analyzed trip-based visits to restaurants and assessed individuals' dynamic restaurant exposure. Multiple regression models were employed to evaluate the influence of both residential neighborhood attributes (within a 400-meter buffer) and mobility-based environmental factors on restaurant visits. We also applied logistic regression to examine how the food environment at previous stops affects subsequent dining choices.

Results: Built environment and socioeconomic characteristics within the 400-meter residential buffer significantly explained both residential and mobility-based restaurant exposure ($R^2=0.6$ and 0.4 , respectively). The median distance from home to visited restaurants was 2.8 km, indicating that car users often patronized restaurants relatively close to home. Additionally, a 10% increase in the proportion of late-night snack shops at previous stops was associated with a 21% rise in the probability of visiting a late-night snack shop at the subsequent stop.

Conclusion: This study highlights the potential of home-based neighborhood planning to shape dietary exposures during daily travel. It also suggests that individual restaurant exposure may be path-dependent, where the food environment of prior stops significantly influences subsequent dietary choices. These findings offer important insights for behavioral nutrition and physical activity research, emphasizing the need to incorporate dynamic environmental exposures into public health strategies aimed at improving dietary behavior.

SO.2.10-10

Shrinkflation in the Food Supply: Does It Affect Nutritious Products Differently? Evidence from Québec Packaged Foods

I. Petitclerc^{1,2}, L. Saulais^{1,3}, M.-È. Labonté^{1,2}, S. Pomerleau¹, A. Corriveau¹, V. Provencher^{1,2}

¹Université Laval, Centre Nutrition, Santé et Société (NUTRISS), Institute of Nutrition and Functional Foods (INAF), Québec, Canada, ²Université Laval, School of Nutrition, Québec, Canada, ³Université Laval, Department of Agri-food Economics and Consumer Science, Québec, Canada

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Shrinkflation, the practice of reducing a product's quantity without a proportional price decrease and without any disclosure to consumers, is a strategy used by manufacturers and retailers to maintain profit margins amid rising food costs. However, it remains understudied in the scientific literature, particularly in relation to nutritional quality. This study assessed the prevalence of shrinkflation across five packaged food categories contributing the most to saturated fat, sugars, and sodium purchases in Québec (Canada), and examined whether it differentially affects products according to their nutritional quality.

Methods: Product weights, prices, and nutritional information were collected from the packaging of all available items in five food categories sold in Québec (Canada) at two time points. Products that could be matched between the two time points were then compared (ready-to-eat breakfast cereals 2016–2021, $n=200$; sliced breads 2017–2021, $n=135$; cookies 2019–2024, $n=335$; salty snacks 2020–2025, $n=331$; and processed cheeses 2021–2025, $n=85$). Shrinkflation was observed when product weight decreased without a proportional change in price, resulting in an increase in unit price (price per 100 g). Nutritional quality was assessed using the thresholds of Health Canada's front-of-package (FOP) nutrition symbol (mandatory by January 2026), which identifies products high in saturated fats, sugars and/or sodium.

Results: Overall, 12.2% (132/1081) of products exhibited shrinkflation. Prevalence differed significantly across food categories ($p=0.0002$): 4.4% in sliced breads, 7.0% in ready-to-eat breakfast cereals, 11.8% in processed cheeses, 14.2% in cookies, and 16.6% in salty snacks. Among processed cheeses, shrinkflation affected more products of higher nutritional quality (without the FOP: 22.5%) than products of lower nutritional quality (with the FOP: 2.2%; $p=0.005$). No significant differences were observed in other food categories.

Conclusion: Although its prevalence varies across food categories, shrinkflation seems to be used among products frequently purchased by Québec consumers. Except for processed cheeses, it appears to affect products regardless of their nutritional quality. This practice is deceptive to consumers and further reduces their purchasing power during a period of high inflation. Such findings highlight the need to implement regulations to better regulate this strategy, to favor consumers' financial and nutritional well-being.

SHORT ORALS

SO.2.10-11

Economic and Health Impacts of Dietary Improvements in New Zealand: Combining Computable General Equilibrium Modelling and Multi-state Life-table Modelling

C. Cleghorn¹, L. Cobiac², D. Hamill³, W. Kaye-Blake³

¹University of Otago, Public Health, Wellington, New Zealand, ²Griffith University, School of Medicine, Queensland, Australia, ³New Zealand Institute of Economic Research, Wellington, New Zealand

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Unhealthy diets have been identified as a public health concern and a burden to the economy. This research aims to present the effects of changing population dietary intake in New Zealand (NZ) to meet the national dietary guidelines on health, social and economic dimensions.

Methods: Changes to the population dietary intakes were calculated as the difference between baseline intake (from the most recent national nutrition survey) and the NZ dietary guidelines: Increases of 102% and 172% in fruit and vegetable consumption and decreases of 100% and 90% in sugar sweetened beverage (SSB) and processed meat consumption respectively. Changes were modelled using TERM-NZ, a computable general equilibrium model of the NZ economy with a detailed agricultural sector. TERM-NZ was used to estimate changes in agricultural production, food prices, household food expenditure, food production and the NZ gross domestic product (GDP). Health impacts from changes in dietary intake were modelled using a multi-state life-table model. Modelling outcomes were the change in health-adjusted life years (HALYs) and health system costs/cost savings modelled over the 2018 population's lifetime (3% discounting).

Results: By assumption, these changes cause an initial economic loss because it involves moving consumers away from their most-preferred dietary choices, but these losses were small: less than one percent changes in GDP and household consumption for each change in risk factor and all changes modelled together. Additionally, the estimated impact on productivity was more than sufficient to pay for an improved diet. These collective changes in the population diet generated 409,000 modelled HALYs. Modelling risk factors separately generated HALY gains between 80,200 for a 90% reduction in processed meat consumption to 129,000 for removing all consumption of SSBs. Healthcare cost savings for the collective changes were over \$23 Billion (NZ dollars) over the life course of the cohort.

Conclusion: These results suggest that improving NZ diets at the national level is economically feasible; it will not disrupt the economy. These changes are associated with large improvements in the health of the NZ population and would generate large health system costs savings. This research also demonstrated the value of interdisciplinary research and combined modelling exercises.

SO.2.10-12

“SNAP Shouldn’t Be Political”: A Qualitative Investigation of Black Mothers’ Experiences with SNAP in Washington, DC

J. Stokes¹, G. Headrick²

¹George Washington University, Washington, United States, ²George Washington University, Public Health Nutrition in the Department of Exercise and Nutrition Sciences, Washington, United States

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments

Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose:

This study explores how the Supplemental Nutrition Assistance Program (SNAP) influences food access, food dignity, and overall well-being among Black mothers in Washington, DC. Despite its intent to reduce food insecurity, SNAP is often shaped by administrative complexity, inconsistent implementation, and societal stigma. This research seeks to illuminate how these structural and social factors affect participants' lived experiences and perceptions of dignity in seeking, enrolling in, and using food assistance. Using an intersectional lens, this project centers Black mothers' narratives to understand how race, gender, and policy interact in shaping food access and user experience within the SNAP system.

SHORT ORALS

Methods: We conducted semi-structured, in-depth interviews with n=20 Black mothers living in Washington, DC, who receive SNAP. Participants were interviewed in Fall 2025 for approximately 60 minutes each over Zoom. Interviews focused on participants' interactions with SNAP, perceived barriers, and emotional and social implications of participation. Audio recordings were professionally transcribed and analyzed using inductive and deductive coding to identify key patterns and emergent themes, guided by a phronetic iterative approach.

Results:

Preliminary thematic findings suggest that SNAP has not modernized at the same pace as broader technological and societal change. Outdated systems and bureaucratic inefficiencies continue to create barriers for users rather than facilitating equitable, dignified access. Participants described inaccurate benefit calculations, rigid eligibility requirements, and limited support from caseworkers who often lacked empathy or administrative knowledge. Many reported frustration with system errors that delayed or disrupted benefits, leading to heightened stress and feelings of exclusion. Specifically, participants cited a loss of benefits during recertification periods due to technical challenges and ineffective communication from administrators and case workers.

Conclusion:

This study contributes to the field of behavioral nutrition by revealing how SNAP's structural stagnation perpetuates inequity and undermines user dignity. The findings underscore the need for system-wide modernization, improved staff training, and greater inclusion of participant voices in policy design. True progress in food access depends on centering dignity, accessibility, and lived experience within social benefit systems.

SO.2.10-13

Self-reported Use of GLP-1 Agonist Medications and Impacts on Eating Behaviours and Physical Activity across 5 Countries: Data from the 2024 International Food Policy Study

R. Acton¹, C. White¹, R. Davis², J. Adams³, C. Roberto⁴, L. Vanderlee⁵, A. Jáuregui⁶, D. Hammond¹

¹University of Waterloo, School of Public Health Sciences, Waterloo, Canada, ²University of South Carolina, Arnold School of Public Health, Columbia, United States, ³University of Cambridge, MRC Epidemiology Unit, Cambridge, United Kingdom, ⁴University of Pennsylvania, Perelman School of Medicine, Philadelphia, United States, ⁵Université Laval, School of Nutrition, Québec, Canada, ⁶Instituto Nacional de Salud Pública, Cuernavaca, Mexico

SO.2.10 Policies and environments: Structural Approaches to Healthy Food Environments
Room 1, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Use of GLP-1 agonist medications for the management of diabetes and obesity has increased in the past 5 years. However, limited population-level data exist on the potential global impacts of GLP-1 medications on eating behaviours and physical activity (PA). This study examined self-reported GLP-1 use and changes to eating behaviours and PA in 5 countries.

Methods: Data were analysed from the 2024 International Food Policy Study (IFPS), a multinational population-based survey. Adults aged 18-100 years (n=19,795) in Australia, Canada, Mexico, the UK and the US were recruited using probability and non-probability sampling. Respondents reported their use of GLP-1 agonist medications. Current and past-12-month GLP-1 users reported on changes in eating behaviours and PA 'since' taking the medication (for current users) or 'when' they took the medication (for past-12-month but not current users). Descriptive statistics examined GLP-1 use by country, as well as changes in behaviours.

Results: Overall, 6.5% of respondents across all countries reported ever using a GLP-1 medication. GLP-1 'ever' use was highest among US respondents (9.9%), followed by Australia (8.0%), Canada (6.6%), the UK (4.6%) and Mexico (3.4%). Among current and past-12-month GLP-1 users, 47% reported eating healthy food more often (31% less often), 50% reported eating unhealthy food less often (24% more often), 34% reported getting more enjoyment from food (35% less enjoyment), 41% reported spending less time thinking about food (36% more time), and 47% reported getting more PA (22% less), since/when taking the GLP-1 medication. Findings will also be presented on perceptions of cost, side effects, and quality of life. Results from the upcoming 2025 IFPS surveys (collected December 2025) will be included to examine trends over time.

Conclusion: This study provides some of the first data on GLP-1 use across multiple countries. As many as 1 in 10 respondents reported ever using a GLP-1 agonist medication, and most current and past-12-month users reported

SHORT ORALS

changes to eating and PA since taking the medication. These results help to uncover the potential impacts of GLP-1 medications on eating behaviours and PA and highlight the importance of considering these medications and their accessibility when designing nutrition and PA research and interventions.

SO.2.11-08

Projected Impacts of Climate Change on 24-hour Movement Behaviours: Modelling Future Temperature Effects on Sleep, Sedentary Time and Physical Activity

T. Ferguson¹, C. Maher¹, R. Curtis¹, F. Fraysse¹, B. Lechat², S. Mavoa³, S. Chastin⁴

¹Adelaide University, Allied Health & Human Performance, Adelaide, Australia, ²Flinders University, Flinders Health and Medical Research Institute: Sleep Health, College of Medicine and Public Health, Adelaide, Australia, ³Murdoch Children's Research Institute, Melbourne, Australia, ⁴Glasgow Caledonian University, School of Health and Life Sciences, Glasgow, United Kingdom

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns
Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The study aimed to estimate how projected future temperature increases are likely to affect 24-hour movement behaviours in adults.

Methods: This secondary analysis drew on data from the Annual Rhythms in Adults (ARIA) study, a 13-month longitudinal cohort of 368 adults living in Adelaide, Australia. Participants wore a Fitbit Charge 3 continuously for 13-months, producing 85,182 valid person-days of minute-level behaviour data, categorised into sleep, sedentary time, light physical activity (LPA), and moderate-to-vigorous physical activity (MVPA). Daily maximum and minimum temperature data were obtained from the Australian Bureau of Meteorology and linked to individual days.

A Monte Carlo simulation framework modelled temperature-behaviour relationships across 0.5 °C bins. MVPA used a two-step approach: (1) estimating the probability of any MVPA to account for high-zero occurrences, and (2) estimating cumulative probabilities of minutes of MVPA on days where MVPA occurred. Sleep, sedentary behaviour, and LPA were modelled in a single step as no zeros were present. Simulations were run 1,000 times under five IPCC warming scenarios (+1.5 °C to +4.4 °C). Outputs were summarised as year-long projections and exposure-response curves (temperature percentiles vs. behaviour minutes), smoothed using 28-day moving averages.

Results: Simulations projected small but consistent behavioural shifts with warming. Annual averages increased for MVPA (+3 h 53 min to +5 h 48 min) and LPA (+12 h 42 min to +22 h 28 min), while sleep declined (-12 h 15 min to -27 h 45 min). Physical activity gains were concentrated in cooler months, whereas sleep losses persisted year-round. Changes in sedentary behaviour were minimal.

Conclusion: Rising temperatures may modestly increase year-long physical activity but reduce sleep duration, producing meaningful cumulative health implications. This modelling framework offers a new approach to integrating behavioural pathways into climate-health projections, informing future adaptation and mitigation efforts.

SO.2.11-01

Multi-component Self-regulation Predicts Physical Activity Intention-behaviour Profiles in Canadian Adults

A. Manankil-Lakusta¹, A.S. Lee¹, R.E. Rhodes¹

¹University of Victoria, Exercise Science, Physical & Health Education, Victoria, Canada

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns
Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Despite widespread intentions to engage in regular physical activity (PA), most individuals fail to follow through, resulting in a persistent intention-behavior (I-B) gap. The Multi-Process Action Control (M-PAC) framework highlights reflective, regulatory, and reflexive processes; however, the regulatory layer is often reduced to planning. This study prioritized a multicomponent test of regulation—proactive planning, reactive coping, self-monitoring, and social monitoring—alongside standard M-PAC predictors, and explored age/sex patterns.

SHORT ORALS

Methods: A sample of 570 Canadian adults (aged 19–65) completed a baseline survey assessing intention and M-PAC constructs including the four regulatory subcomponents (i.e., proactive planning, reactive coping, self-monitoring, and social monitoring); moderate-to-vigorous PA (MVPA) was assessed 3 weeks later. Discriminant function analyses tested predictors in hierarchical blocks (reflective, regulatory and reflexive), adjusting for sex, education, and income. Exploratory subgroup analyses by age and sex were conducted.

Results: Three I-B profiles emerged:

- a) non-intenders (16.5%, $n = 94$),
- b) unsuccessful intenders (57.0%, $n = 325$), and
- c) successful intenders (25.4%, $n = 145$), yielding an overall I-B gap of 69%.

Each M-PAC construct was a significant predictor of I-B profile membership ($p < .01$). The primary discriminant function explained 92.8% of variance (Wilks' $\lambda = .56$; canonical $r = .64$); cross-validated classification was 56.2%. Adding regulatory ($\Delta R^2 = .05$) and reflexive ($\Delta R^2 = .01$) blocks improved discrimination ($ps < .01$). Among regulatory processes, proactive and reactive regulation were equally strong ($r = .65$), with additional contributions from self-monitoring ($r = .40$) and social monitoring ($r = .22$). Exploratory subgroup analyses suggested reflective processes predicted across all age-sex strata, while incremental effects of regulatory and reflexive processes were small.

Conclusion: Findings generally support the predictive utility of M-PAC's three processes and multi-component regulation in explaining the I-B gap. Proactive and reactive tactics should be prioritized in intervention design. M-PAC effects appeared generally invariant to age and sex in this sample, but confirmation with larger, and stratified samples is warranted.

SO.2.11-02

Maintaining Physical Activity through the Retirement Transition: The Role of Motivation and Ageing Expectations

J. Seghers¹, F. Boen¹, J. van Uffelen¹, N. Vansweevelt¹

¹KU Leuven, Department of Movement Sciences, Leuven, Belgium

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns
Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Retirement from work constitutes a major life transition that can substantially affect physical activity (PA) patterns, either positively or negatively. Understanding the psychological and behavioural determinants of PA during this period is essential for promoting active ageing. This study examined pre-retirement predictors of the daily amount of accelerometer assessed moderate-to-vigorous physical activity (MVPA) six months after retirement.

Methods: A longitudinal observational study was conducted among 93 older adults in Flanders, Belgium (mean age at retirement = 62.8 years; 60.2% women). Time spent in MVPA was assessed using wrist-worn ActiGraph accelerometers for seven consecutive days, both six months before and six months after retirement. Pre-retirement psychological and behavioural characteristics were assessed using validated questionnaires, including the Expectations Regarding Aging Survey (ERA-12) and the Behavioural Regulation in Exercise Questionnaire (BREQ-3). Predictor variables included gender, education level, daily MVPA six months before retirement (hours/day), autonomous motivation for physical activity (Relative Autonomy Index), and expectations regarding aging across three domains: physical health (ERA-PH), mental health (ERA-MH), and cognitive function (ERA-CF). Hierarchical multiple regression analyses were performed to identify predictors of daily MVPA six months post-retirement (hours/day).

Results: The final model explained 56.1% of the variance in post-retirement MVPA ($R^2 = .561$, $p < .001$). Significant predictors of the daily amount of MVPA six months after retirement were: daily MVPA six month pre-retirement (Beta = .576, $p < .001$), positive expectations regarding physical ageing (Beta = .209, $p = .019$) and self-determined motivation for PA (Beta = .229, $p = .009$). Gender, educational level, and expectations regarding ageing in the mental health or cognitive function domain were not significant.

Conclusion: These findings emphasize the importance of maintaining higher levels of MVPA prior to retirement and highlight the role of psychological factors in sustaining PA during the transition to retirement. In particular, encouraging autonomous motivation for PA (i.e., motivation driven by intrinsic enjoyment, personal value, or a sense of purpose) and promoting positive self-perceptions of physical ageing (i.e., believing that one's physical abilities will remain strong) before retirement may help individuals stay active afterward. Such interventions may facilitate sustained engagement in PA, thereby contributing to healthier ageing trajectories.

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns

Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The most prevalent barrier to physical activity participation in adults is the perceived lack of time. Yet, time-related barriers extend beyond the activity itself to include ancillary demands such as travel, equipment preparation, grooming, and recovery. These ancillary demands constitute *Non-Exercise Tasks Required for Activity* (NEXTRA); the hidden time cost of exercise. This study aimed to conceptualize the NEXTRA construct, define its components, and develop a self-report instrument to quantify NEXTRA time.

Methods: The study followed a four-step development process:

- (1) A preliminary list of NEXTRA activities was drafted by an expert panel informed by the literature and experience;
- (2) Semi-structured interviews with 17 adult exercisers (10 women, mean age = 32.7 years, 10 countries represented) were conducted to establish content validity and identify additional NEXTRA activities. Directed qualitative content analyses combined deductive and inductive coding to confirm and expand the NEXTRA framework;
- (3) The refined list informed construction of the *NEXTRA Time Questionnaire*, which captures time spent on pre- and post-exercise NEXTRAS; and,
- (4) Cognitive interviews were used to explore how members of the target sample understand, recall, and respond to the questions using think-aloud and verbal probing techniques.

Results: Interview data confirmed engagement in nearly all predefined pre- and post-exercise NEXTRA activities. Pre-exercise tasks most frequently reported included changing into exercise apparel (23 mentions), preparing and packing gear (22), and travelling to the exercise location (22). Four items, finding parking, arranging caregiving, checking accessibility, and making arrangements with a coach, were rarely or not reported. Two emergent items, *scheduling* (e.g., planning around childcare or weather) and *hydrating/eating before exercise*, broadened the construct. Post-exercise findings highlighted showering and grooming (25 mentions), recovery routines (15), and hydrating/eating after exercise (25) as common. Cognitive interviews indicated strong comprehension and perceived relevance of items, with minor refinements made to improve clarity and flow of survey questions.

Conclusion: Conceptualizing and operationalizing NEXTRA advances understanding of time-related barriers to exercise by identifying the full temporal cost of exercise. The resulting NEXTRA instrument provides a foundation for quantifying these hidden demands, which will inform interventions and policies aimed at reducing modifiable time burdens and promoting sustained exercise participation.

SO.2.11-04

Bridging Hospital and Community Care - Cost-Effectiveness of a Lifestyle Referral Program for Cardiovascular and Musculoskeletal Patients: The LOFIT Randomized Controlled Trial

J.G. Jelsma¹, M.L. van Dijk¹, J. Vrijsen², I. van den Akker-Scheek², A. Bouma³, R. Dekker³, L.M. te Loo⁴, W. van Mechelen¹, H. van der Ploeg¹, C. Schumacher², J.M. van Dongen⁵, O.b. of the LOFIT Consortium¹

SHORT ORALS

¹Amsterdam UMC, Public & Occupational Health, Amsterdam, Netherlands, ²UMCG, Orthopaedics, Groningen, Netherlands, ³UMCG, Rehabilitation, Groningen, Netherlands, ⁴Inholland University of Applied Sciences, Centre of Expertise Prevention in Health and Social Care, Haarlem, Netherlands, ⁵Vrije Universiteit, Health Sciences, Amsterdam, Netherlands

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns

Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: This study was done to investigate the cost-effectiveness of the LOFIT study. In the LOFIT study we evaluated the effects of a lifestyle front office (LFO) in hospital care. The LFO is a novel care pathway designed to optimize patient-centered lifestyle support in secondary and tertiary care and connect patients with community-based lifestyle programs. This study aimed to evaluate the cost-effectiveness of the LFO among patients with (cardio)vascular and musculoskeletal disorders. This approach is innovative in embedding a dedicated LFO to bridge the gap between medical treatment and sustainable lifestyle change.

Methods: To evaluate the cost-effectiveness of the LOFIT trial (n = 325), intervention group was compared to usual care, focusing on the primary outcome (adapted Fuster-BEWAT) and QALYs. Data were collected at baseline and 3-, 6-, 9-, and 12-month follow-up. Resource utilization data were obtained through self-report questionnaires (iPCQ and iMCQ), covering healthcare utilization, medication use, informal care, unpaid productivity losses, absenteeism, and presenteeism. Intervention delivery costs were calculated based on hospital and research group expenses for recruitment, implementation, preparation, and materials. Other healthcare use was valued using Dutch standard cost prices; informal care and unpaid productivity losses used Dutch shadow prices. Absenteeism and presenteeism were monetized using the Friction Cost Approach. Analyses were conducted after 12-month data collection (no interim analyses). Multilevel regression analyses following the intention-to-treat principle assessed primary and secondary outcomes, accounting for hospital-level clustering, with significance set at $p < 0.05$ and multiple imputation applied.

Results: Cost-effectiveness analyses were performed from a societal perspective. Overall, healthcare costs increased in the intervention group, while simultaneously societal costs decreased. Compared with usual care the intervention dominates as it was both more effective (0.53; 95% CI: 0.02 – 1.04) and less expensive (€-2836; 95% CI: -6764 - 1091). The difference in QALYs between intervention and control group was 0.016 (95% CI: -0.007 tot 0.039). The incremental cost per QALY was €-179.308. with a 95% probability that the intervention was cost-effective at a willingness-to-pay threshold of €0.

Conclusion: This study provides evidence on a scalable, patient-centered, and cost-effective hospital-based lifestyle care pathway that links patients to community resources and improves health outcomes.

SO.2.11-05

Transition to Active Communities: A Qualitative Study of Citizens' Experiences with a Social Prescribing Intervention for Physical Activity Engagement

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns

Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Using co-creation between citizens, civil society and municipal stakeholders (including politicians), and researchers, we developed and implemented a social prescribing intervention in a Danish socioeconomically disadvantaged municipality. The purpose of the intervention was to support citizens with type 2 diabetes (T2D), cardiovascular disease, and/or obesity in maintaining physical activities in civil society after a municipal rehabilitation program. The intervention included 1. a link worker; 2. a visiting program; 3. a digital platform; and 4. co-created physical activities. The aim of this study was to provide an in-depth investigation of the citizens' experiences with the link worker and visiting program.

Methods: This study was an explorative qualitative investigation using semi-structured individual interviews.

SHORT ORALS

Participants for the study were sampled among participants in a pilot study embedded in project Active Communities. We used criterion-based purposive sampling to select participants with experience from either T2D or weight management programs, and continued physical activity engagement in civil society (yes/no). The interviews were audio-recorded, transcribed verbatim, and analyzed using reflexive thematic analysis including researcher triangulation.

Results: Twelve citizens with experience from the social prescribing intervention were included; five had experience with a T2D management program, and seven with a weight management program. They had an age range of 44-78 years, eight were women and four were men, and most reported two or more chronic conditions. The analysis resulted in four main themes informed by three to four subthemes each: 1. invisible burdens in new contexts, covering how citizens' past experiences and understandings influenced how they emerged themselves in a rehabilitation program; 2. a health environment to support transition, covering the importance of the link worker and a welcoming civil society; 3. personal preferences permeated participation, covering how specific physical activity features and contexts influenced engagement; and 4. social community in competition with social norms, covering how social aspects served as (de)motivators for physical activity engagement.

Conclusion: This study provides important in-depth information on the influence of the social prescribing intervention on citizens' physical activity engagement in civil society following a municipal rehabilitation program. This is important information for local anchoring and general adaptation to other health care settings.

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns
Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: International evidence points to the relevance of the built environment for regular physical activity (PA) at the population level. The aims of the study were to shed light on this relationship and to investigate the role of different domains of both built environment and PA in German city residents.

Methods: The analyses were based on baseline data (adults aged 25-75 years residing in two German cities) collected in a non-randomized controlled intervention study. Subjectively perceived built environment (ALPHA Environmental Questionnaire – long version) and subjective PA as metabolic equivalents (METs) in MET minutes/week (MET-min/wk) (Global Physical Activity Questionnaire – GPAQ) were recorded in telephone-based interviews. METs were categorized into three domains (work, transportation, leisure) and MET values for each domain were specified as follows: moderate (MET= 4.0), intense (MET = 8.0), cycling and walking (MET = 4.0). PA was objectively measured as number of steps per day using pedometers worn for seven consecutive days. Cross-sectional associations between different domains of built environment and PA were investigated using multivariable regression models to determine β -coefficients with 95% confidence intervals (95% CI) for objectively measured and self-reported PA.

Results: 627 residents (60% female) took part in the baseline interviews and wore pedometers for seven days. On average, participants walked 7,866 ($\pm$ 3,487) steps per day. Subjectively, they reported an average of 4,628 ($\pm$ 4,338) MET-min/wk [work: 351 ($\pm$ 1,116) moderate MET-min, transportation: 842 ($\pm$ 988) MET-min, leisure: 750 ($\pm$ 1,226) moderate MET-min]. For pedometer-based steps, greater distance to local facilities (β = -59, 95% CI: -117, -2) tended to be associated with lower daily step counts. For self-reported PA, a supportive home environment (β = 473, 95% CI: 156, 791) showed the largest positive association, while well-maintained infrastructure (β = 174, 95% CI: 1, 347) and a connected walking and cycling network (β = 147, 95% CI: 1, 293) were linked to more MET-min. Surprisingly,

SHORT ORALS

perceptions of higher neighborhood safety ($\beta = -131$, 95% CI: $-232, -29$) were associated with fewer MET-min.

Conclusion: Our results suggest relationships between perceived accessibility of public infrastructure and ownership of exercise equipment with regular PA in urban areas.

SO.2.11-09

Developing a Blended Care Behaviour Change Intervention Supporting a Sustainable Active Lifestyle after Stroke: Using Co-creation

L. te Lindert^{1,2}, J. Meesters^{3,4,2}, R. Dekker^{1,2}, A. de Rooij^{4,2}

¹University of Groningen, University Medical Center Groningen (UMCG) Nethen, Department of Rehabilitation Medicine, Groningen, Netherlands, ²Basalt Rehabilitation Centre, Innovation, Quality + Research, The Hague, Netherlands, ³The Hague University of Applied Sciences (THUAS), Center of Expertise in Health Innovation, The Hague, Netherlands, ⁴Leiden University Medical Center (LUMC), Department of Orthopaedics, Rehabilitation and Physical Therapy, Leiden, Netherlands

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns
Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Stroke survivors in outpatient rehabilitation face many challenges to engage in an active lifestyle including meeting physical activity (PA) and sedentary behaviour (SB) recommendations, which are important for reducing health risks. Adopting and maintaining an active lifestyle requires a structured, theory-driven approach to effectively support behaviour change. This study, therefore, aimed to develop a structured, evidenced based targeted intervention for an active lifestyle through a co-creation approach.

Methods: This intervention development study used the Behaviour Change Wheel (BCW) framework as guide for literature search and the co-creation workshops: five with both health care professionals (HCPs) and stroke survivors, an additional workshop with only HCPs and two online meetings with partners of stroke survivors. During the workshops the targeted behaviour, key barriers and facilitators, appropriate solutions (i.e., intervention functions and behavior change techniques (BCTs) according BCW), and delivery-modes were identified.

The content of the workshops was informed by findings from a scoping review conducted by the research team on barriers, facilitators, and promising interventions for SB, as well as existing systematic reviews for PA. Insights gained during workshops were used in subsequent workshops, guiding the ongoing intervention development.

Results: Co-creation workshops involved twelve healthcare professionals (HCPs), five stroke survivors, and three partners of stroke survivors. The outline of the intervention reflects the need for a structured programme existing of five parts: 1) a personalised physical activity and behaviour profile, discussing personal barriers, 2) education; 3) personalised and targeted support with self-monitoring and (e)Coaching in collaboration with multidisciplinary team; 4) sustainable physical activity plan; 5) after care. This intervention is based on the following intervention functions: education, enablement, training, and environmental restructuring and encompasses acceptable and practical BCTs as: information about health consequences, goal setting, action planning, monitoring and social support, which were identified as important by participants of the workshop.

Conclusion: A structured intervention development process, using BCW-framework and co-creation led to an integrated and personalised blended care active lifestyle intervention in outpatient stroke rehabilitation. The methodology used could be useful for researchers and practitioners involved in the development of similar interventions.

Room 2, May 29, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Physical activity (PA) is a key component of behavioral weight loss (BWL) for emerging adults (EAs). Theory-based motivational enhancements such as self-determination theory (SDT) and behavioral economics (BE) have shown promise in promoting PA, but limited work has assessed effects by race. This is a secondary analysis from REACH, a 3-arm comparative efficacy trial for weight loss among EAs.

Methods: 257 Black and White women (18-25 years, body mass index: 25-45kg/m²) were randomized to 1 of 3 arms: developmentally-adapted behavioral weight loss (aBWL), aBWL+BE, or aBWL+SDT. All participants received a 6-month program (1 group session, 1 individual session, followed by a digital platform). aBWL+BE included financial incentives for self-monitoring and weight loss and aBWL+SDT included autonomy support and optional experiential nutrition and PA classes. In all arms, PA goals were personalized using baseline accelerometry, with tailored progressions to ³250 min of moderate-to-vigorous PA (MVPA)/week. Assessments occurred at 0 and 6 months. A repeated measures ANOVA assessed change in MVPA across race and treatment arm.

Results: 114 women (22.17±2.16 years, body mass index: 33.5kg/m², 61.4% White) had valid wear time (≥8 hours on ≥3 weekdays + 1 weekend day). No statistically significant change in MVPA was observed from 0 to 6 months overall ($F_{2,152}=3.207$, $p=.075$, $h^2=.021$; 288.53±156.31 to 267.10±178.39) or by arm ($F_{2,152}=1.221$, $p=.298$, $h^2=.016$; aBWL: 297.44±118.37 to 286.93±199.03; aBWL+BE: 288.23±151.34 to 237.51±151.34; aBWL+SDT: 282.62±192.46 to 274.78±199.43). There was no interaction between arm and race ($F_{2,152}=1.168$, $p=.314$, $h^2=.015$; aBWL Black women: 260.88±92.67 to 251.64±175.97, White women: 332.23±138.62 to 320.52±219.45; aBWL+BE Black women: 345.80±170.47 to 248.59±123.49, White women: 237.35±128.45 to 227.71±132.43; aBWL+SDT Black women: 269.69±218.18 to 258.47±188.38, White women: 293.65±170.80 to 288.68±186.44).

Conclusion: Improvements in MVPA were not observed, but baseline MVPA for both racial groups was >250 minutes which is high and could explain why findings differ from those observed previously for adiposity. Future BWL trials should incorporate strategies to further enhance MVPA to support weight loss maintenance and cardiometabolic health for EA women.

SO.2.11-11

Early Warning Signals of Sudden Losses in Daily Step Count: An Intensive Longitudinal Study of over 20,000 Adults

D. Baretta¹, A. Mazéas², A. Chalabaev³, J. Inauen¹, G. Chevance⁴

¹University of Bern, Institute of Psychology, Bern, Switzerland, ²University of Southern Denmark, Danish Centre for Motivation and Behaviour Science (DRIVEN), Odense, Denmark, ³University Grenoble Alpes, SENS, Grenoble, France,

⁴University Rennes, Inserm, EHESP, Irset (Institut de Recherche en Santé, Environnement et Travail), Rennes, France

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns

Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Maintaining physical activity over time is challenging, and even successful behavior change attempts are often followed by setbacks and relapses. Recent evidence suggests that sudden losses in walking behavior can be anticipated by characteristic patterns in daily step count. One such pattern is an increase in dynamic complexity (DC), a metric that captures how large and irregular fluctuations in a time series are. Prior work showed that a one standard deviation increase in DC was associated with a 43 percent higher likelihood of experiencing a sudden loss in walking behavior within the next few days. This study aimed to replicate and extend these findings in a large real world dataset, examining whether DC predicts sudden losses across different timescales, magnitudes of loss, and population subgroups.

Methods: Daily step data were obtained from 21,425 adults participating in a digital physical activity intervention, yielding 5,474,501 person days of observation. Step counts were passively recorded via smartphones or wearable devices. Sudden losses were defined within each participant using multiple operational definitions, as decreases of 20, 30, or 40 percent relative to their median daily step count, sustained for at least 7, 14, or 28 days. DC was calculated using a 7-day rolling window. Generalized linear mixed effects models tested whether DC in the preceding days predicted sudden losses, controlling for elapsed time and exposure to the intervention.

Results: Participants averaged 7,817 steps per day and experienced sudden losses about once every one hundred days, with a median duration of 33 days. Higher DC consistently predicted impending losses. Across all operational definitions, higher DC in the preceding days increased the odds of a sudden loss (ORs from 1.93 to 1.32), with the strongest association observed for larger, short term losses (OR = 1.93). The effect was most pronounced among less active individuals (OR = 2.03).

Conclusion: Increases in dynamic complexity precede sudden losses in walking behavior. DC functions as a robust

SHORT ORALS

early warning signal and could be leveraged in digital health systems to trigger just in time adaptive interventions and prevent declines in physical activity.

SO.2.11-12

Characterising Physical Activity and Lifestyle Counselling Using State Space Grids in Adults with Osteoarthritis or Total Joint Prosthesis

M. Wildekamp^{1,2}, L.M. te Loo^{3,4,5}, J.G.M. Jelsma^{3,4,6}, M.L. van Dijk^{3,4,6}, C.C.A. Schumacher¹, J. Vrijksen¹, I. van den Akker-Scheek¹, F. Hoekstra^{2,7}

¹University Medical Center Groningen, Department of Orthopaedics, Groningen, Netherlands, ²The University of British Columbia, Centre for Chronic Disease Prevention and Management, Kelowna, Canada, ³Amsterdam UMC, Location Vrije Universiteit Amsterdam, Department of Public and Occupational Health, Amsterdam, Netherlands, ⁴Amsterdam Public Health Research Institute, Health Behaviours & Chronic Diseases, Amsterdam, Netherlands, ⁵Inholland University of Applied Sciences, Faculty of Health, Sports and Social Work, Haarlem, Netherlands, ⁶Amsterdam Public Health Research Institute, Quality of Care, Amsterdam, Netherlands, ⁷The University of British Columbia, Department of Medicine, Division of Social Medicine, Vancouver, Canada

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns
Room 2, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Physical activity (PA) is essential for individuals with osteoarthritis (OA) or a total joint prosthesis, yet PA levels remain low. Counselling interventions show promise in increasing PA, but little is known about how PA-related behaviour change techniques (BCTs) are delivered and received. This study aimed to characterise counselling sessions with clients with OA or total joint prosthesis by examining durations of BCT delivery and receipt.

Methods: We analysed intake counselling sessions from a subgroup of the Dutch multicentre Lifestyle Front Office for Integrating Lifestyle Medicine in the Treatment of patients (LOFIT) trial. This subgroup included clients with OA or a joint prosthesis who were referred by a hospital medical specialist and had a counselling session with a lifestyle coach. In these sessions, lifestyle coaches, trained in motivational interviewing, discussed lifestyle with clients and determined referral to a community-based lifestyle initiative. Transcripts were independently coded by two researchers using a coding manual including codes for PA-related BCTs delivered by coach and received by client, with discussion until consensus was reached. Interactions were analysed using State-Space-Grids (SSG) analyses.

Results: Transcripts from 16 sessions involving five lifestyle coaches (80%female) and 16 clients (mean(SD) age=60(11.8) years, 50%female) were analysed. Sessions lasted on average 57 minutes (SD=10.5). Approximately one-third of session time focused on PA-related BCTs, one-fifth on other lifestyle BCTs, and the remainder on other content. Within PA-related BCTs, lifestyle coaches spent most of their time discussing PA referral options (mean=7.1 minutes, SD=4.9), while clients spoke the longest about barriers and facilitators to engaging in PA (mean=3.9 minutes, SD=2.5). Durations varied considerably both within and between sessions.

Conclusion: Counselling for adults with OA or a total joint prosthesis is highly interactive. Clients actively discuss barriers and facilitators to engage in PA, while coaches provide guidance and information on referral options. Variability in BCT durations within and between sessions suggests that these conversations are tailored to individual client needs. SSG analyses offered novel insights into how PA-related BCTs are delivered and received, informing the development and optimisation of counselling interventions to better support PA participation in this population.

SO.2.11-13

I DARE YOU: A Game-based Educational Intervention to Enhance Mediterranean Diet Literacy and Motivation in Adolescents

M.G. Casucci¹, M. Segura¹, M. Rodriguez Monforte¹, J. Muñoz Martinez¹, B. Angélica Caneda¹, C. Bolivar¹, A. Gelonch¹, E. Carrillo Alvarez¹

¹Blanquerna Ramon Llull, Barcelona, Spain

SO.2.11 Motivation and behavior change: Occupational Health and Long-Term Movement Patterns
Room 2, May 29, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Adolescence represents a critical stage for consolidating lifelong dietary patterns, yet adherence to the Mediterranean Diet among youth has progressively declined in recent years. Traditional didactic methods often fail to sustain interest or promote the transfer of knowledge into everyday practice. I DARE YOU, developed within the PRIMA-Tool4MEDLife project, is a trivia-style educational board game designed to foster Mediterranean Diet literacy, intrinsic motivation, and behavioral transfer among adolescents through interactive, curriculum-integrated sessions. This study evaluates its effectiveness in improving knowledge, engagement, and perceived applicability of healthy dietary behaviors.

Methods: A quasi-experimental pre-post design includes two groups: an experimental group participating in I DARE YOU sessions and a control group completing the same assessments without gameplay. The intervention consists of 4–6 hours of distributed gameplay across four weeks, combining trivia, recall, and guided debriefing activities based on principles of spaced and retrieval practice. All participants complete the validated Lit-MEDiet questionnaire at baseline (T0) and post-intervention (T1) to assess changes in Mediterranean Diet literacy. At T1, they also complete a short Intrinsic Motivation Inventory (IMI)-based questionnaire adapted to measure Interest/Enjoyment and Value/Usefulness, together with additional items assessing perceived transfer to daily life (e.g., ability to apply what was learned to food choices). The IMI is a standardized self-report instrument designed to assess intrinsic motivation and engagement in educational and behavioral contexts, providing insight into how enjoyment and perceived value support sustained learning and behavior change. A mixed-design ANOVA will analyze time × group effects, while an optional follow-up (T2) four weeks later will assess knowledge retention.

Results: Preliminary analyses show that the experimental group demonstrates significant improvements in Mediterranean Diet literacy, especially in food and production dimensions, together with increased intrinsic motivation and stronger perceived transfer to daily habits.

Conclusion: I DARE YOU demonstrates that short, distributed game-based interventions can effectively enhance nutrition literacy, intrinsic motivation, and behavioral transfer among adolescents. This participatory and engaging approach offers a scalable, low-cost strategy for integrating health promotion into school curricula and for reinforcing Mediterranean Diet adherence in Euro-Mediterranean contexts.

SO.2.12-01

Mapping Nutritional Policy Gaps in Canadian Early Learning and Child Care Centres: A Scoping Review

O. Koegler¹, A. Sebbahi², J. Lee¹, C. Tugault-Lafleur²

¹Toronto Metropolitan University, School of Nutrition, Toronto, Canada, ²University of Ottawa, School of Nutrition Sciences, Ottawa, Canada

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool
Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Early Learning and Child Care (ELCC) settings represent critical environments for fostering healthy eating behaviours and improving dietary intake among young children. Evidence-based policies, guidelines, and recommendations play an important role in guiding practices and ultimately, the quality of the ELCC settings. There is limited consolidated knowledge about the content, quality, and comprehensiveness of food and nutritional guidelines aimed for ELCC providers across Canadian provinces and territories. Therefore, the objective of this scoping review was to identify gaps and opportunities in the ELCC food environment by evaluating the content and quality of provincial and territorial nutritional guidelines in Canada.

Methods: A grey literature search was conducted using four strategies: database search, custom Google search, targeted web-based searches, and expert consultation. Documents were included in the analysis if they were published by federal, provincial/territorial governments, or non-governmental organizations; were intended for ELCC providers; and written in English or French. Two reviewers independently extracted data. The content of documents was evaluated using the Analysis Grid for Environments Linked to Obesity framework, while quality was determined by alignment with the 2019 Canada's Dietary Guidelines and the World Health Organization Guidelines for Complementary Feeding of Infants Aged 6–23 Months.

Results: A total of 18 documents from 10 jurisdictions (out of 13) were included in the analysis. While most provinces and territories addressed criteria related to the physical environment (e.g., water availability, alignment with national dietary guidelines), the political and economic domains were largely overlooked, with only three out of 10 jurisdictions including recommendations to develop and adopt centre-level healthy eating policies. The sociocultural environment varied widely across jurisdictions: three addressed more than 10 of the 18 criteria, while two addressed <5 criteria.

SHORT ORALS

Seven out of 10 jurisdictions were well aligned with Canada's Dietary Guidelines. Eight out of 10 jurisdictions included ≤five specific feeding recommendations for <2-year-old children.

Conclusion: Our findings highlight opportunities to strengthen policies that could better support holistic healthy food environments in ELCC settings across Canada. Harmonizing ELCC nutrition guidelines across provincial/territorial jurisdictions could further promote more equitable and comprehensive food environments for young children across Canada.

SO.2.12-02

Physical Activity Frequency and Mathematics Performance among Adolescents: A Cross-national Analysis of PISA 2022. Data from Spain, Denmark, and Germany

E. Roig Hierro¹, N. Ros Garcia¹, C. Løgstrup Ottesen², F. Buscà Donet¹, T. Rottmann³, M. Guillem Molins⁴, N. Ukley³, S. Coronado Alvarez³, J.D. Guldager⁵

¹Universitat de Barcelona, Barcelona, Spain, ²UCL University College, Jelling, Denmark, ³Bielefeld University, Bielefeld, Germany, ⁴Universitat Autònoma de Barcelona, Barcelona, Spain, ⁵University College South Denmark, Research, Esbjerg, Denmark

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool
Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: This study investigates whether adolescents' physical activity (PA) frequency predicts mathematics achievement across different European educational systems. While prior research highlights a positive association between PA and academic outcomes, little is known about whether this relationship is consistent across countries with diverse school and social contexts. The study innovatively integrates PISA 2022 data with behavioral and socioeconomic indicators to examine the independent and combined effects of PA, socioeconomic status (SES), gender, and immigrant background on academic performance.

Methods: A cross-sectional, descriptive design was applied using data from the 2022 PISA assessment (N = 43,116; mean age = 15.79 years) from Spain, Denmark, and Germany. Mathematics performance was measured using the ten plausible values (PV1–PV10) in PISA. Weekly PA frequency and socioeconomic and cultural status (ESCS) were extracted from the student questionnaire administered in the PISA Study. Complex-sample general linear models and chi-square tests assessed the independent and combined effects of PA frequency, ESCS, gender, and immigrant background on mathematics performance. Analyses were weighted for population representativeness and conducted following OECD guidelines.

Results: Moderate PA (1–3 sessions per week) was associated with significantly higher mathematics scores compared to no or excessive activity (≥5 sessions/week; all $p < .001$). Students engaging in three weekly sessions performed best across all ESCS quartiles. PA contributed an additional 1.3–1.6% to the explained variance in performance beyond ESCS ($R^2 = 16.5$ – 17.4%). Gender and immigrant background further increased explanatory power ($R^2 = 19.3$ – 20.2%). German students outperformed peers from Denmark and Spain, but country did not moderate the PA–achievement relationship.

Conclusion: Findings indicate that moderate physical activity contributes independently to adolescents' academic performance in mathematics, supporting a hormetic (inverted U-shaped) relationship between PA frequency and cognitive outcomes. These results underscore the importance of promoting regular physical activity among adolescents due to its potential impact on academic performance in mathematics. Educational policies should ensure regular and systematic PA opportunities in school settings where all students have access, thereby helping to reduce inequalities in PA opportunities and potentially mitigate the association between socioeconomic background and educational outcomes.

SHORT ORALS

SO.2.12-03

Deepening Researchers' Understandings of Children's Storytelling of Outdoor Play Using Audio-visual Methods

J.-L. McIsaac^{1,2}, R. Ashley^{3,2}, S. Reddington⁴, R. Feicht⁵, M. Stone⁵, C. McLean⁴, A. Patey²

¹Mount Saint Vincent University, Education, Child and Youth Study, Halifax, Canada, ²Mount Saint Vincent University, Early Childhood Collaborative Research Centre, Halifax, Canada, ³Mount Saint Vincent University, Education, Halifax, Canada, ⁴Mount Saint Vincent University, Child and Youth Study, Halifax, Canada, ⁵Dalhousie University, School of Health and Human Performance, Halifax, Canada

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool

Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Visual and storytelling methods of research can amplify children's first-voice experiences to move from research *about* children toward research *with* children. Audio-visual methods are increasing in popularity across child-related disciplines and in research on children's outdoor play experiences. Audio-visual research methods may support a deeper understanding of children's perspectives of physical activity in the outdoor play context. This presentation will explore how using audio-visual methods in research with children supports researchers' abilities to understand children's storytelling through their physical movement, narrations, and creativity within their outdoor active play.

Methods: Go-along interviews (n=20) were conducted with children (n=10) during their typical outdoor play setting. Interviews were recorded using chest-mounted GoPro cameras worn by children and researchers to ensure that physical mobility was not inhibited. Reflexive thematic analysis was conducted by re-watching the videos alongside the transcripts for deeper immersion into the children's active play to understand children's perspectives through the process of videography.

Results: The findings share three themes that emphasize children's role in sharing their outdoor experiences using audio-visual methods and how this informs our understanding of children's storytelling through active play. The themes describe how children's interactions with materials and the outdoor environment weave storytelling into play, how capturing imaginative play on camera provides insight into children's lived experiences, and how cameras can enable children's visual documentation with nature. Our findings demonstrate the advantage of using audio-visual tools to capture fast-paced and physical perspectives of children's active play that cannot be captured through narrative interviewing. The GoPros cameras provided a first-voice account of children's outdoor play experiences that could not be understood through observation alone.

Conclusion: The findings demonstrate how audio-visual methods can strengthen the researchers' interpretations of children's connections to, and knowledge of, social and material environments through play. The videos provided a way of allowing re-immersion of the researchers into the active play experiences captured through audio-visual methods. Children's perspectives of outdoor active play and movement was shared visually, from their own voices, thereby generating meaningful recommendations for policy and practice.

SO.2.12-04

Combined Impact of Parent and Educator Feeding Practices on Development of Eating Behaviour in Australian Toddlers

R. Byrne¹

¹Queensland University of Technology, Brisbane, Australia

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool

Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Parent feeding practices that are responsive to children's hunger and fullness cues support the development of optimal eating behaviours, intake and growth. While the practices used by educators in the early childhood education and care (ECEC) setting also impact child behaviour and intake, no studies attempt to evaluate the combined influence of parent and educator feeding practices on child outcomes. This longitudinal study sought to assess children's exposure to seven different feeding practices across both home and ECEC, and examine the relationships with change in *food fussiness*, *satiety responsiveness* and *food responsiveness* over 12-months.

Methods: Two-year-old children (N=121) attending ECEC ≥3 days per week were enrolled, along with their parent and

SHORT ORALS

key educator. Parents and educators each completed a version of the Feeding Practices and Structure Questionnaire (FPSQ-28). Subscales scores were derived for parent and educator for seven practices (possible range 1-5, with higher scores representing greater use of that practice). Each subscale score was dichotomised into high (>3) or low (≤ 3) and used to categorise children into four exposure groups, e.g., i. low use of *persuasive feeding* by both parent and educator, ii. parent low and educator high, iii parent high and educator low, iv. high use of *persuasive feeding* by both parent and educator. Parents completed the Child Eating Behaviour Questionnaire (CEBQ) at enrolment, then 6- and 12- months post-enrolment. This was used to derive subscale scores at the three time points. Repeated measures ANOVA assessed change in eating behaviour subscale scores over time as well as time*group interaction, with group being the four possible feeding practice exposures on enrolment.

Results: For the whole sample, *food fussiness* increased over time (2.8-3.2, $F=14.1$, $p<.001$) while *satiety responsiveness* and *food responsiveness* remained stable (3.1-3.2; 2.7-2.6). On examination of time*group interaction, *food fussiness* increased regardless of whether children experienced low or high use of *persuasive feeding* across settings. *Satiety responsiveness* increased when children were exposed to high parent/low educator use of food as a reward for behaviour (3.0-3.4, $F=2.83$, $p=.03$).

Conclusion: Characterising a child's exposure to feeding practices across settings is challenging, which may have resulted in these unexpected findings.

SO.2.12-05

Nutrition, Physical Activity and Screen Time Environments in Arab Family Childcare Homes in Israel

S.W. Warykas¹, G. Oladeji¹, D. Zaid², O. Baron-Epel², K. Gans¹

¹University of Connecticut, Storrs, United States, ²University of Haifa, Haifa, Israel

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool
Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Early childhood is a critical window for obesity prevention, and childcare settings, including family childcare homes (FCCHs), are pivotal in shaping children's early health behaviors. In the U.S., studies have found that children cared for in FCCHs rather than centers may be at higher risk for obesity. In Israel, 77% of children under age three are cared for in FCCHs, especially children from Arab sectors. Little is known about nutrition, physical activity (PA), and screen-time (ST) environments among Arab FCCH providers in Israel and their alignment with evidence-based practice standards.

Methods: 36 Arab FCCH providers (100% female and Muslim, mean age 47.2 years) completed a survey adapted from the Nutrition and Physical Activity Self-Assessment for Child Care and Environment and Policy Assessment and Observation–Self-Report tools. The survey assessed foods and beverages served, feeding practices, nutrition education, PA opportunities, and ST behaviors. Data were analyzed descriptively using frequencies and percentages.

Results: Over 67% of providers avoided serving high-fat meats, fried potatoes or fried meats; however, 67% served fruit juice $\geq$ one/week (36.1% did daily) and 80.6% served sweets $\geq$ once/week. Over half (58.3%) used food as a reward, though nearly all avoided using food as punishment. Negative bottle-feeding practices for infants were common: 75.0% reported propping infants' bottles $\geq$ twice daily; 75.0% reported adding cereal to infants' bottles $\geq$ once per day and 61.1% reported using bottles to soothe infants before other methods. During meals, 61.1% reported televisions were off, and only 5.6% reported device use. Most (61.1%) led planned nutrition education activities $\geq$ once/week and 97.3% agreed that they talk to children about the importance of healthy eating. Most (72.2%) led lessons focused on building motor skills $\geq$ once/week, and 88.8% reported often teaching children about being physically active.

Conclusion: Practices of Arab FCCH providers in Israel largely aligned with recommendations, including minimal fried food use, and engagement in nutrition education and PA. Nonetheless, frequent provision of juice, sweets, using food as a reward and bottle feeding practices remain areas for improvement. Culturally tailored interventions may strengthen consistent implementation of best practices in feeding, PA, and ST environments among FCCH providers.

SHORT ORALS

SO.2.12-06

When Care Feels Like Home: Perceived Psychosocial Outcomes of a Community-based Perinatal Social Nutrition Intervention

J. Tardif^{1,2,3}, M. Turcotte^{1,2,3}, S. Lepage⁴, L. Godin^{5,2,3}, G. Mercille^{6,7,8}, A. Boutin^{5,9}, E. Carboneau^{1,2,3}

¹Université Laval, Faculty of Agricultural and Food Sciences, Quebec, Canada, ²Institute of Nutrition and Functional Foods (INAF), Quebec, Canada, ³NUTRISS Centre, Quebec, Canada, ⁴Alima, Perinatal Social Nutrition Centre, Montreal, Canada, ⁵Université Laval, Quebec, Canada, ⁶Université de Montréal, Departement of Nutrition, Montreal, Canada, ⁷Centre for Public Health Research (CReSP), Montreal, Canada, ⁸Integrated University Health and Social Services Centre for the Centre-Sud-de-l'Île-de-Montréal, Montreal, Canada, ⁹CHU de Québec-Université Laval Research Centre, Quebec, Canada

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool
Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Perinatal social nutrition is an intervention approach tailored to address specific barriers faced by socioeconomically vulnerable pregnant individuals, such as low income, precarious immigration status, and lack of health insurance, by offering individual consultations, group workshops and food assistance. It aims to reduce health inequities, by providing fair access to nutritional perinatal care. This study aims to explore the psychosocial outcomes of a perinatal social nutrition intervention. This research is conducted in collaboration with Alima, Perinatal Social Nutrition Centre, which is a Montreal-based (Canada) community organization that provides this type of intervention.

Methods: Semi-structured individual interviews are conducted in two phases: (1) with Alima care providers (which are mostly registered dietitians); and (2) with clients who received services at Alima in the last year. Sociodemographic data is collected from client files. The interview guides address Alima's approach, topics covered during consultations and perceived psychosocial outcomes. Interviews are then transcribed, revised and analyzed using an inductive thematic approach to identify and organize recurring themes using NVivo software.

Results: The first phase with care providers is completed (n=5). Data analysis identified multiple non nutrition related themes that are frequently addressed by care providers, such as childbirth preparation (e.g. signs of labor), pregnancy rights (e.g. work-related rights, access to healthcare), and basic rights (e.g. immigration status, housing rights). They mention that they address these themes because they sometimes are one of the only healthcare professionals overseeing the pregnancy, which highlights the importance of access to this type of healthcare and of building a trusting therapeutic alliance with clients. Practitioners also described Alima as a welcoming and empowering space, which values clients' autonomy in determining their own priorities, so that the intervention is tailored to their individual needs. The second phase with clients (planned n=15) will be completed by Spring 2026, to enhance the results collected in the first phase.

Conclusion: This study acknowledges how nutritional interventions using perinatal social nutrition can extend beyond the field of nutrition, contributing to the empowerment of clients. On a larger scale, these findings could inspire other healthcare organizations to adopt similar approaches with socioeconomically vulnerable populations.

SO.2.12-07

Small Bodies – Big Questions (SB-BQ): Early-life Behaviors, Environments, and Infant Body Composition Trajectories within an Exposome Framework

M. Höfler¹, M. van Poppel¹, A. Kruse¹

¹University of Graz, Department of Human Movement Sciences, Sport and Health, Graz, Austria

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool
Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The increasing prevalence of adiposity poses a major public health challenge. Evidence suggests that rapid weight gain in the first six months of life markedly increases the risk of obesity, metabolic, and cardiovascular diseases later on. However, the underlying mechanisms remain poorly understood, as most research relies on BMI rather than direct measures of body composition and fat distribution. The SB-BQ study aims to identify behavioral, biological, and environmental determinants of infant adiposity trajectories within the first year of life. The study applies a holistic **exposome framework**, integrating precise body composition measures with objective assessments of movement behavior, sleep, nutrition, and environmental exposures. The innovative integration of multiple domains across

SHORT ORALS

five detailed measurement points allows for the creation of comprehensive, longitudinal **body composition and growth trajectories** to reveal early-life pathways of adiposity risk.

Methods: SB-BQ is a prospective cohort study including **120 parent-infant dyads** recruited during pregnancy. Infants are followed from birth to 12 months, with five standardized assessments. Air-displacement plethysmography and high-resolution ultrasound determine **total fat and lean mass**, as well as **regional fat distribution**. The **NAPPA wearable system** objectively measures posture, movement patterns (e.g., tummy time, sedentary behavior), and sleep in natural home environments. Questionnaires and sensors capture infant nutrition, parental feeding and activity practices, psychosocial well-being, and environmental exposures such as air quality, noise and light pollution. Furthermore, infants microbiome and metabolome, as well as breastmilk will be analyzed. **Multilevel and growth-curve modeling** will be used to estimate longitudinal body composition trajectories and explore associations with behavioral and environmental determinants.

Results: Data collection is ongoing. Preliminary analyses will summarize **baseline characteristics, variability of exposures**, and **early associations** between infant **movement, sleep, feeding practices**, and **adiposity indicators**, generating reference trajectories of fat and lean mass across the first year of life to identify early behavioral predictors of adiposity risk.

Conclusion: SB-BQ introduces an innovative, interdisciplinary, and systems-oriented approach to understanding early adiposity development. By linking objective phenotyping with behavioral and environmental data, this study will identify early **“windows of opportunity”** for effective, holistic obesity prevention and inform strategies to promote healthy growth and well-being from infancy onward.

SO.2.12-08

Understanding Weight Stigma in Preschool Settings: Perspectives from Preschool Educators

M. Sjunnestränd¹, N. Neuman¹, K. Eli², K. Järholm³, X. Ramos Salas⁴, P. Nowicka¹

¹Uppsala University, Food Studies, Nutrition and Dietetics, Uppsala, Sweden, ²University of Warwick, Warwick Medical School, Coventry, United Kingdom, ³Lunds University, Department of Psychology, Lund, Sweden, ⁴Replica Communications, Kristianstad, Sweden

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool
Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: To examine how preschool educators perceive and respond to young children's talk about body, weight, and health, with a focus on how their reactions and interpretations may contribute to the early formation of weight bias and stigma.

Methods: Semi-structured interviews were conducted with preschool educators in Sweden (n=23; all female; mean experience=18.7 years; 78% with a university degree). Interviews were transcribed verbatim and analyzed using thematic analysis.

Results: Three main themes, encompassing several subthemes each, were identified in the thematic analysis. The first theme, Neutral understanding of bodies, included the subthemes *Friendship beyond body size* and *Innocent curiosity*. Under this theme, educators perceived conversations about weight, bodies and health as neutral, framed as curious questions without intent to harm and with limited impact on children's social relationships. The second main theme, The emergence of weight bias, included the subthemes *Weight stigma with intention* and *Feeling different*. Educators described instances of intentional weight stigma, along with early signs that such attitudes may already be internalized by children. The third main theme, Meanings and responsibilities around children's bodies, includes the subthemes *Challenging early weight labelling*, *Extending weight stigma to parents*, and *Sensitive topics amid limited support*. Educators expressed concern about labelling children as having overweight or obesity, while others recognized childhood obesity as a legitimate concern, often attributing it to parental practices. They felt a strong responsibility to model respectful language and inclusive practices, yet lack structured guidance.

Conclusion: While educators perceive children's curiosity about bodies as generally neutral, they report observations suggestive of early weight bias and stigma. Educators feel responsible to protecting children from harmful experiences, but often lack clear guidance. These findings underscore the need for training and institutional support to help educators address weight and health sensitively, foster positive body image, and reduce potential weight bias in this setting.

Navigating Infant Feeding Together: The Role of Parent-educator Relationships in Early Childhood Education and Care Settings

G. Leung¹, M. Lum¹, N. Pearson^{2,3}, H. Lamont⁴, N. Moumin¹, S. Keenan⁵, C. Dix⁶, L. Rychetnik⁷, S. Yoong^{1,2}

¹Deakin University, Institute for Health Transformation, Geelong, Australia, ²University of Newcastle, College of Health, Medicine and Wellbeing, Callaghan, Australia, ³Hunter New England Local Health District, Hunter New England Population Health, Wallsend, Australia, ⁴Hunter New England Population Health, Wallsend, Australia, ⁵La Trobe University, Department of Food, Nutrition and Dietetics, Melbourne, Australia, ⁶University of Sunshine Coast, School of Health, Sippy Downs, Australia, ⁷University of Sydney, Leeder Centre for Health Policy, Newtown, Australia

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool

Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: In Australia, almost half of children aged 0 to 5 attend Early Childhood Education and Care (ECEC) services. Many commence at around 6 months of age, coinciding with the time when solid foods are typically introduced. ECEC therefore represents a key setting in which young children are introduced to food and develop early eating habits. This study explored factors influencing ECEC educators' infant feeding practices, with a focus on how they are affected by their relationships with parents and families.

Methods: Participants were ECEC staff who worked in or made decisions relating to the infant room in their service, and parents of children aged 3 to 24 months attending ECEC services. Separate online focus groups were conducted with educators and parents. The discussion guide included questions on barriers and enablers to implementing the Australian Infant Feeding Guidelines and responsive feeding practices, ECEC service/ educator – parent communication, and ways both groups could support each other in promoting best practice infant feeding. Thematic analysis was conducted, via an iterative inductive coding process.

Results: Seven online focus groups were conducted: four with ECEC educators (n= 17) and three with parents (n= 19). Most educators preferred to follow each parent's preference on practices such as using the baby-led weaning method, texture progression and introducing new foods. Educators reported adopting this approach because they receive conflicting information and guidance on infant feeding and are unsure of which sources to trust. Moreover, they expressed feeling uncertain about how to approach conversations when their views on infant feeding did not align with families; and suggested that having clear service policies or evidence regarded as credible by both groups would help them navigate these situations. In contrast, most parents expressed high levels of trust in educators' knowledge and skills to provide appropriate and safe nutrition for their children while in care.

Conclusion: The relationship between ECEC educators and parents is an important yet underexplored influence on infant feeding practices. Strengthening ECEC service-level structures, through clear policies, professional development, and consistent communication channels with parents, may enhance educators' confidence in their expertise and support consistent implementation of best practice infant feeding.

SO.2.12-10

The Artichoke Model: Informing the Development of a Best Practice Guide for ECEC Food Environments

R. Sambell¹, A. Elford¹, A. Devine¹

¹Edith Cowan University, School of Medical and Health Sciences, Perth, Australia

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool

Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: ECEC settings play a crucial role in shaping young children's lifelong food behaviours, as many children spend extended hours in care and receive up to half of their daily food intake there. ECEC food environments are complex, encompassing not only *what* food is offered, but also *how* it is served, and the influence of broader *environmental* factors. This research describes the development of a comprehensive, conceptual framework comprising the key components considered essential to foster positive and supportive food environments within ECEC settings.

Methods: Eleven experts with extensive experience in ECEC food environments participated in a 2-day co-design workshop in Brisbane, Australia in 2024. Participants represented diverse perspectives, including research (n=5), practice (n=4), and policy (n=2). Through collaborative discussion and visual mapping, participants identified and

SHORT ORALS

refined core components considered essential for positive ECEC food environments. The resultant framework, named the Artichoke Model, was subsequently shared with the National Nutrition Network – ECEC, a community of practice comprising 36 members from research, practice, government, and non-government sectors. Iterative feedback informed multiple revisions, leading to the final model.

Results: The Artichoke Model positions the child at the centre, surrounded by three interconnected layers: the “what”, “how”, and “environmental levers.”

- *What:* Menu and meal quality, food safety and allergy management, food education and curriculum, and environmental sustainability.
- *How:* Mealtime environment and practices, staff knowledge and training, and family engagement.
- *Environmental levers:* Policy, social-emotional wellbeing and cultural practices, food security, organisational readiness and capacity, and continuous quality improvement.

Conclusion: Grounded in systems thinking and equity principles, the Artichoke Model offers a structured, interdisciplinary framework for fostering a whole-of-service approach to enable positive, inclusive, and sustainable ECEC food environments. The Artichoke Model is now being applied to the development of a “*Best Practice Guide for ECEC Food Environments*”, co-designed with researchers, practitioners, educators, allergy specialists, and experts in trauma-informed approaches for inclusive and emotionally safe mealtimes. This presentation will introduce the Artichoke Model, and present elements of the Best Practice Guide, scheduled to launch in Australia in August 2026.

SO.2.12-12

A Qualitative Study Exploring How Early Child Education and Care Settings in England Respond to Child Food Insecurity

C. Holt¹, A. Porter¹, N. Heslehurst², R. Kipping¹

¹University of Bristol, Bristol Medical School, Bristol, United Kingdom, ²Newcastle University, Newcastle, United Kingdom

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool
Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: 2.3 billion people globally experienced moderate or severe food insecurity in 2024. The cost of living crisis has pushed many more people into food insecurity, as incomes have not risen enough to match the cost of essentials. In particular, households with children under 4 years of age in the UK were more likely than households with school-age children or no children to experience food insecurity. This study aimed to explore how early child education and care (ECEC) settings are responding to food insecurity in light of the cost-of-living crisis and what food insecurity policies and interventions would be feasible and acceptable to implement.

Methods: A qualitative study design was adopted, utilising 1-1 semi-structured interviews with 17 staff in early child education and care settings in areas of deprivation across England. Interview transcripts were analysed using an inductive reflective thematic analysis approach.

Results: Four main themes emerged:

- (1) early child education and care settings burdened by food insecurity,
- (2) cost of living impacting food quality and quantity in early child education and care settings,
- (3) early child education and care settings’ response to food insecurity, and
- (4) transforming food insecurity through early child education and care settings.

We found that early child education and care settings are paying considerable attention to this issue and are tirelessly working to prevent and alleviate the impacts of food insecurity on the young children attending and their families. Participants suggested a range of support strategies that may be beneficial, including: food distribution to attending families through early child education and care settings, free meal provision for attending children and skills education and classes for attending families.

Conclusion: This study demonstrated that ECEC settings in England are not funded or set up to respond to food insecurity; however, they are well placed to identify it and have the interest and connections to potentially implement effective food insecurity strategies for young children and families attending. However, more funding and support are needed at the government level. More research is needed to understand how these strategies, suggested by early years settings, have been and could be perceived by the families attending.

SO.2.12-13

Contexts and Motivations for Screen Viewing among Socially Vulnerable Families with Young Children: A Qualitative Study within the ECAIL Trial

L. Vanhoutte¹, D. Poquet¹, J. Bernard^{1,2}, P. Sauvegrain^{1,3}, S. Lioret¹

¹Université Paris Cité and Université Sorbonne Paris Nord, Inserm, Centre for Research in Epidemiology and Statistics (CRESS), OPaLE (Obstetric, Perinatal, Paediatric, Lifecourse Epidemiology) Team, Paris, France, ²Université de Montpellier, Inserm, Desbrest Institute of Epidemiology and Public Health (IDESP), Montpellier, France, ³Sorbonne Université, Département Universitaire de Maïeutique, Paris, France

SO.2.12 Early care and education: Environments of Care: Nurturing Health from Home to Preschool

Room 3, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Screen time in young children is associated with lower physical activity, higher consumption of unhealthy foods, and adverse health outcomes. Despite national guidelines recommending no screen viewing before age 2 (U.S.) or age 3 (France), early exposure remains common, particularly among socially disadvantaged families. Understanding the contexts, motivations, and barriers surrounding screen viewing is essential to inform realistic and equitable public health interventions. This qualitative study, embedded within the ECAIL randomized controlled trial among socially vulnerable families, explored parental attitudes, contexts, and practices related to screen viewing during toddlerhood.

Methods: The ECAIL trial recruited 607 pregnant women from two maternity wards in northern France, followed by dietitians until their child's second birthday. Participants in the intervention arm receive personalized support, including breastfeeding promotion, practical advice on balanced nutrition and active lifestyles, and financial incentives to access kitchen utensils and healthy foods at reduced prices. Semi-structured home interviews were conducted with 54 mothers (32 intervention, 22 control) when their child was aged 16–26 months. Guided by the COM-B framework (Capability, Opportunity, Motivation), interviews lasting 19–169 minutes were transcribed verbatim and analyzed thematically using NVivo software.

Results: Most mothers were aware that screen viewing should be limited for young children. Nevertheless, screen practices varied widely—from strict prohibition to negotiated or self-regulated use—reflecting differing constraints and coping strategies. Four main contexts of screen viewing emerged:

- (1) routine use during meals or busy times,
- (2) recreational viewing by children,
- (3) parental screen use in the child's presence, and
- (4) co-viewing activities (e.g., video calls, family programs).

Screens were mainly used for convenience or child appeasement rather than developmental purposes. Environmental and family factors (e.g., older siblings, housing conditions, access to outdoor space) also influenced practices.

Conclusion: Mothers described their child's screen viewing as routine and often unavoidable, despite recognizing its drawbacks. Most sought to define a “reasonable” or “healthy” use, balancing ideals with daily realities. These findings highlight the need for public health recommendations that move beyond prohibition toward practical, risk-reduction guidance—helping parents identify acceptable uses, appropriate content, and the value of co-viewing in mitigating potential harms.

SO.2.13-01

Can an Anti-inflammatory Diet Offset the Increased Cancer Risk Associated with Night Shift Work?

C. Lassale^{1,2}, G. Castaño-Vinyals¹, T. Dierssen-Sotos³, V. Moreno⁴, V. Martin⁵, A. Aizpura⁶, M. Pollan⁷, M. Guevara⁸, J.R. Hebert⁹, K. Papantoniou^{10,1}

SHORT ORALS

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Night shift work has been linked to increased risks of breast, prostate, and colorectal cancers. We aimed to examine the combined effects of night shift work and dietary inflammatory potential on the risk of four common cancer types.

Methods: We analyzed data from the MCC-Spain study, a population-based multi-case-control study of four tumor types, including 4325 cancer cases (colorectal, breast, prostate, and stomach) and 3560 controls recruited between 2008–2015 across 12 Spanish regions. Dietary data from food frequency questionnaires collected at recruitment were used to calculate the energy-adjusted Dietary Inflammatory Index (E-DII) score, which defines the inflammatory potential of the diet. The median E-DII among controls (−0.564) defined anti- and pro-inflammatory diet. Lifetime occupational histories provided information on night shift work, including work hours, cumulative duration (years), and frequency (average number of night shifts/month) for jobs held >1 year. Night shift work was defined as at least 3 hours between midnight and 6:00 a.m. Unconditional logistic regression estimated odds ratios (OR) and 95% confidence intervals (CI) for the joint associations of E-DII (anti- vs. pro-inflammatory diet) and night shift work (never vs. ever, <15 vs. ≥15 years, and <3 vs. ≥3 nights/month) for each cancer type, adjusting for potential confounders.

Results: Night shift workers showed higher dietary inflammatory potential, energy intake, and consumption of red meat, alcohol, and sugar than day workers. There was no significant interaction between E-DII and night shift. There was no significant association between night work and cancer among participants with anti-inflammatory diet. A pro-inflammatory diet was associated with elevated odds of colorectal and stomach cancer in both day workers and night workers, whereas it was only associated with breast and prostate cancer risk in night shift workers. When considering intensity of night shift work, there was no protective effect of anti-inflammatory diet for breast and stomach cancer with high shift work intensities (≥3 nights/month).

Conclusion: Night shift work combined with a pro-inflammatory diet increased colorectal, breast, prostate, and stomach cancer risk. Anti-inflammatory diets may mitigate cancer risk among night shift workers, particularly with low exposure.

SO.2.13-02

Exercise for the Mitigation of Cancer Therapy-related Cardiac Dysfunction in Breast Cancer Patients Treated with Anthracyclines: A Systematic Review and Meta-analysis

A. Jiménez Marín¹, M.V. García-Coll¹, M. Castellanos-Montealegre¹, E. Martín Moraleda¹, S. Aznar-Lain¹

¹University of Castilla-La Mancha, Faculty of Sports Sciences, Toledo, Spain

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Cancer therapy-related cardiac dysfunction (CTRCD) is a major long-term complication in breast cancer patients treated with anthracycline-based chemotherapy. Exercise has been proposed as a non-pharmacological strategy to reduce cardiotoxicity, yet evidence remains inconsistent and disease-specific insights are limited. This systematic review and meta-analysis aimed to evaluate the effects of long-term exercise interventions on key markers of CTRCD in breast cancer patients undergoing anthracycline treatment. The innovation of this study lies in its strict focus on anthracycline-treated breast cancer populations, minimizing clinical heterogeneity and providing more precise evidence to guide exercise prescription in cardio-oncology.

Methods: A systematic search of PubMed, Scopus, Cochrane CENTRAL, and Web of Science was conducted for randomized controlled trials (RCTs). Eligible studies included anthracycline-treated breast cancer patients participating in ≥12-week exercise programs (aerobic, resistance, or combined), compared to usual care. Outcomes included left ventricular ejection fraction (LVEF), global longitudinal strain (GLS), cardiac troponin I (cTnI), cardiac troponin T (cTnT), and N-terminal prohormone of brain natriuretic peptide (NT-proBNP). Effect sizes were pooled using mean difference (MD) or standardized mean difference (SMD) with 95% confidence intervals (CI). Six RCTs involving 360 participants met inclusion criteria.

Results: Meta-analytic findings showed no statistically significant differences between exercise and control groups for LVEF (SMD = 0.69; 95% CI: −0.56 to 1.94; p = 0.21), GLS (MD = 0.32%; 95% CI: −0.27 to 0.91; p = 0.28), cTnI (SMD = −1.75; 95% CI: −15.52 to 12.02; p = 0.35), cTnT (SMD = −0.07; 95% CI: −0.44 to 0.30; p = 0.70), or NT-proBNP (SMD = −3.73;

SHORT ORALS

95% CI: -20.07 to 12.62; $p = 0.43$). Heterogeneity was high for several outcomes.

Conclusion: Long-term exercise did not significantly improve standard cardiac markers of CTRCD during anthracycline treatment. While exercise remains essential for overall health and functional capacity, its cardioprotective role against anthracycline-induced damage is not yet conclusive. Findings highlight the need for optimized exercise prescriptions, advanced cardiac assessment (e.g., 3D echocardiography, LVEFpeak), and incorporation of novel biomarkers in future trials. This work contributes to refining exercise-based cardio-oncology interventions and supports the development of evidence-based exercise guidelines for this high-risk population.

SO.2.13-03

Testing a Snackivity™ Based Physical Activity Intervention in Young People Diagnosed with Cancer: Feasibility Randomised Controlled Trial and Nested Qualitative Study

E. Langworthy¹, K. Gokal¹, A. Daley¹

¹Loughborough University, SSEHS, Loughborough, United Kingdom

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Regular physical activity may reduce the side effects of cancer and associated treatment for young people diagnosed with the disease. However, high levels of physical inactivity are common in this population, therefore health behaviour interventions are required to increase their physical activity and improve health outcomes. This randomised controlled trial with a nested qualitative study assessed the feasibility and acceptability of a Snackivity™ based intervention to promote physical activity in young people diagnosed with cancer.

Methods: Thirty-one participants aged between 13-24 years with a cancer diagnosis were randomised (2:1) to a Snackivity™-C intervention or comparator group (physical activity leaflet) for 8-weeks. Intervention participants were encouraged to complete 2-5-minute bouts of moderate-to-vigorous intensity known as 'activity snacks' and were provided with a bespoke mobile phone app (SnackAPP) linked to a Fitbit device. Intervention participants also received support from family members and/or friends as well from physical activity champions. Feasibility and acceptability were assessed using stop-go traffic light criteria (green/amber/red) for recruitment rate, adherence to 2-5-minute 'activity snacks' per/day, total minutes of physical activity (all intensities), and perceived helpfulness of the Snackivity™-C intervention to increase physical activity. Semi-structured interviews with eight participants and two family members were conducted to explore opinions and experiences of the intervention from their perspective.

Results: Recruitment met the amber criteria with 31 participants randomised, but in 10 months, against the target of 39 participants in 6 months (79%). Adherence to 2-5 mins 'activity snacks' was red with 8/21 (38%) participants completing an average of ≥ 4 bouts per/day. Total physical activity adherence met the green criteria with 16/21 (76%) participants completing ≥ 90 minutes of physical activity per/week. 14/21 (67%) participants reported the intervention helped them to increase their physical activity meeting the amber criteria. Semi-structured interviews indicated the intervention was appealing, feasible and increased participants' confidence for physical activity.

Conclusion: The Snackivity™-C intervention was feasible, but acceptability was mixed. Additional work is required to recruit participants more efficiently and to further increase completion of activity snacks. The Snackivity™-C intervention could be useful in improving the health of young people diagnosed with cancer.

SO.2.13-05

Barriers to Physical Activity in Child and Adolescent Cancer Survivors and Controls: A PACCS Study

M. Grydeland¹, M. Bratteteig^{2,3}, C. Rueegg^{3,4}, T. Raastad¹, H.C. Lie⁵, E.H. Larsen^{6,5}, C. Schindera^{7,8}, S. Anderssen², E. Ruud^{6,5}, L. Thorsen^{9,10}

¹Norwegian School of Sports Sciences, Dept. of Physical Performance, Oslo, Norway, ²Norwegian School of Sports Sciences, Dept. of Sports Medicine, Oslo, Norway, ³Oslo University Hospital, Oslo Centre for Biostatistics and Epidemiology, Oslo, Norway, ⁴University of Zurich, Epidemiology, Biostatistics and Prevention Institute, Zurich, Switzerland, ⁵University

SHORT ORALS

of Oslo/Faculty of Medicine, Dept. of Behavioural Medicine, Oslo, Norway, ⁶Oslo University Hospital, Dept. of Pediatric Hematology and Oncology, Oslo, Norway, ⁷University Children's Hospital Basel, Basel, Switzerland, ⁸University of Bern, Institute of Social and Preventive Medicine, Bern, Switzerland, ⁹Oslo University Hospital/Division of Cancer Medicine, Dept. of Clinical Service, Oslo, Norway, ¹⁰Oslo University Hospital, Dept. of Oncology/Unit on Late Effects after Cancer Treatment, Oslo, Norway

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: A physically active lifestyle may reduce the increased risks of cancer- and treatment-induced late effects in childhood cancer survivors (CCS). However, few CCS meet the physical activity (PA) guidelines of ≥ 60 min/day of moderate-to-vigorous physical activity (MVPA). This study investigated self-reported barriers to PA in a European sample of young CCS and compared them to age- and sex-matched controls.

Methods: CCS and controls were recruited from Norway (Oslo and Bergen) and Switzerland (Basel) as part of the Physical Activity in Childhood Cancer Survivors (PACCS) study. We included CCS ≥ 1 -year post-treatment, aged 9–18 years. Barriers to PA were assessed using 15 statements reflecting known PA barriers, rated on a 5-point Likert scale (1=totally disagree, 5=totally agree). Mixed ordinal regression models provided odds ratios (OR) and 95% confidence intervals (CI) to compare barriers between survivors and controls, and between male and female survivors.

Results: The study included 151 survivors (mean age 13.4 ± 2.6 years; 54% male) and 112 controls (13.3 ± 2.6 years; 50% male). Survivors' mean time since diagnosis was 8.2 ± 3.6 years; 50% leukemia, and 97% had received chemotherapy. Compared to controls, survivors reported higher odds on these barriers: "I'm not as good at it as before" (OR: 1.72, 95%CI 1.02-2.91), "My body feels too heavy" (OR: 1.73, 95%CI 1.00-2.96), "I'm in bad physical shape" (OR: 1.68, 95%CI 1.03-2.73), and "I'm too tired" (OR: 1.96, 95%CI 1.23-3.12) (all $p < 0.05$). Female survivors reported higher odds than males on these barriers: "I'm not as good at it as before" (OR: 2.09, 95%CI 1.10-3.99, $p < 0.03$), "I'm in bad physical shape" (OR: 2.19, 95%CI 1.18-4.08) and "I can't keep up like I used to" (OR: 2.10, 95%CI 1.08-4.08) (all $p < 0.05$). Barriers such as pain, bodily shyness, and protective parents did not differ between survivors and controls.

Conclusion: CCS reported higher cancer-related barriers to PA compared to controls, indicating cancer's late effects influence PA at an early age. Female survivors faced greater challenges, emphasizing the need for tailored PA interventions, particularly for girls. Barriers such as pain, bodily shyness, and protective parents were comparable between survivors and controls.

SO.2.13-07

Association between Device Measured Physical Activity and Hospitalisations in Patients Diagnosed with Cancer Assessed Using UK Biobank Data

K. Gokal¹, A. Daley¹, J. Sanders¹, C. Moakes²

¹Loughborough University, School of Sport, Exercise and Health Sciences, Leicestershire, United Kingdom, ²University of Birmingham, Clinical Trials Unit, Birmingham, United Kingdom

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: As the incidence of cancer rises and medical treatments improve, people are living longer with and beyond cancer. However, increasing cases are adding pressures on the healthcare system and its resources. It is estimated that on average cancer patients spend approximately 25 days in hospital as an inpatient in the first year following their diagnosis. However, emerging evidence from small scale studies suggest that the overall length of stay in hospital during cancer treatment could be reduced by regular physical activity. To our knowledge, the proposed study is the first to use UK Biobank data to examine the associations between device measured physical activity and the total number and subsequent length of inpatient hospitalisations among adults with a cancer diagnosis.

Methods: This retrospective cohort study includes data from the UK Biobank that is linked to Hospital Episode Statistics and cancer registries. For this study eligible participants includes those who have had a cancer diagnosis and provided valid (3 days of wear time) accelerometer measured physical activity data within 12 months of their cancer diagnosis. The association between device measured physical activity and hospitalisations in patients diagnosed with cancer will be analysed using logistic regression. All statistical models will be adjusted for age at cancer diagnosis, sex, smoking status, ethnicity and deprivation index. Effect estimates will be reported with 95% confidence intervals.

SHORT ORALS

Results: Of the 501,936 participants in the UK Biobank study, 117,405 have received a diagnosis of cancer, of whom 998 have provided valid accelerometer based physical activity data within 12 months of their diagnosis and will be included in analyses. On average eligible participants had a mean age of 59 years, 53% were male and 52% were non-smokers. Complete results will be presented at the conference.

Conclusion: An association between physical activity, inpatient hospitalisations and an indication of cost savings will contribute to the wider rationale for the inclusion of the routine promotion of physical activity within the cancer care treatment pathway for the benefit of patients, staff and healthcare resources.

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: This study aimed to explore the impact of acute lymphoblastic leukemia (ALL) and its treatment on the sleep and fatigue of pediatric patients who are currently in maintenance therapy. We explored the circadian environment and circadian-related health behaviors of pediatric patients with ALL and their parents to identify opportunities for intervention to improve sleep and cancer-related fatigue. The guiding research question guiding was, "What factors (e.g., treatment related and environmental) influence the sleep patterns, cancer-related fatigue, and circadian disruption of pediatric patients with ALL?" Results will inform the development of an intervention to improve cancer-related fatigue through improving circadian rhythmicity by targeting daily light exposure and sleep patterns.

Methods: We conducted a semi-structured interview with 11 pediatric ALL patients aged 5.2-14.9 years and their caregivers recruited from a pediatric oncology hospital. Interviews were transcribed verbatim and structured rapid analysis was used to identify key categories.

Results: Findings revealed multiple factors that influence the sleep patterns, cancer-related fatigue, and circadian disruption of pediatric patients with ALL. Using the findings as a guide, intervention strategies include encouraging a consistent sleep schedule even on weekends, minimizing evening light exposure in the bedroom, encouraging daytime light exposure through daily outside activity, strengthening existing bedtime routines and reducing screen use before bed. There was a tendency for children to initiate co-sleeping during treatment and some parents noted a need for help transitioning to independent sleeping once children were through the more difficult phases of treatment. Most patients and parents reported receiving little to no guidance from their clinical care team on managing cancer-related fatigue during this important stage of their cancer treatment, identifying an important gap in their treatment and recovery.

Conclusion: Findings highlight the complexities and nuances of cancer-related fatigue and sleep-related impairments and disruptions encountered by families of pediatric patients recovering from ALL. Findings indicate there is a need for a context-sensitive intervention to support pediatric ALL patients' continued recovery by addressing issues related to fatigue, sleep hygiene, and circadian rhythm.

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Patients with cancer are recommended to be physically active and limit sedentary behaviour (SB) before, during, and after cancer treatment. This study aimed to investigate activity profiles in patients with localized renal cell carcinoma (RCC) and colorectal cancer (CRC) and correlates of these activity profiles that could help inform which patients are more likely to be inactive after treatment.

Methods: Baseline data from two multicentre prospective cohort studies were used. The ReLife (n=326) and EnCoRe (n=358) studies objectively measured physical activity (PA) and SB shortly after treatment completion using accelerometers. Latent profile analyses were performed to determine distinct activity profiles and participants were assigned to their most likely profile (%n). To identify correlates of activity profiles, multinomial regression analyses were performed to obtain odds ratio's (OR) and corresponding 95% confidence intervals (CI). Analyses were performed for RCC and CRC separately.

Results: Patients with RCC were on average 63 years old and 71% were men. Patients with CRC were on average 67 years old and 68% were men. In both cancer populations, three distinct activity profiles were identified: a most sedentary (RCC:30%, CRC:16%), an average (RCC:51%, CRC:53%), and a highly active profile (RCC:19%, CRC:31%). In the most sedentary profile for RCC and CRC, mean sedentary time was 11.9 h/day and 13.1 h/day, while mean PA time was 73 min/day and 44 min/day, respectively. Women were less likely to belong to the most sedentary profile for RCC (OR=0.39, 95%CI=0.19-0.78) and more likely to belong to the highly active profile for CRC (OR=2.62, 95%CI=1.40-4.90). Patients with higher educational levels were less likely to be assigned to the highly active profile (high vs low educational level: RCC OR=0.31, 95%CI=0.13-0.76; CRC OR=0.46, 95%CI=0.22-0.96). Patients with higher BMI were less likely to be assigned to the highly active profile (RCC OR=0.91, 95%CI=0.83-0.99; CRC OR=0.92, 95%CI=0.86-0.99).

Conclusion: Patients with RCC and CRC are a mixed group including individuals that are highly sedentary and individuals that are highly active. However, even in the most sedentary profiles patients were physically active. Men, patients with higher education, and patients with higher BMI were more often assigned to less favourable activity profiles.

SO.2.13-09

Associations between the American Institute for Cancer Research/World Cancer Research Fund Lifestyle Behavior Score and Self-reported Health Status among Low-income Households

M. Vadiveloo¹, A. Tovar², E. Elenio², D.M. Williams², O. Galarraga³

¹University of Rhode Island, Nutrition and Food Sciences, Kingston, United States, ²Brown University, Behavioral and Social Sciences, Providence, United States, ³Brown University, Health Services Policy and Practice, Providence, United States

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The American Institute for Cancer Research (AICR) and World Cancer Research Fund (WCRF) convert their diet and lifestyle guidelines into a score quantifying adherence to 8 of 10 Cancer Prevention Recommendations. Higher adherence to these recommendations is associated with reduced cancer risk, highlighting the potential impact of behavior-focused interventions. Despite this well-established causal link, it is not clear how these associations manifest across varied populations with low-income. This secondary analysis of the What's on Your Plate (WOYP) study evaluates the association between the AICR/WCRF score and self-reported health status among households with low-income.

Methods: In January 2024, Rhode Island launched the statewide "Eat Well Be Well (EWBW)" program, a fruit and

SHORT ORALS

vegetable (FV) incentive initiative for households participating in the Supplemental Nutrition Assistance Program (SNAP). EWBW offers a \$0.50 rebate for every \$1.00 spent on FV at participating retailers, with a monthly cap of \$25. WOYP evaluated the program's impact on dietary quality by employing longitudinal pre-post study design with a comparison group (Connecticut). Eligible participants were English/Spanish-speaking SNAP-enrolled adults aged 18+ with access to email/text messaging. This analysis used baseline data from 1,079 non-pregnant adults with complete AICR/WCRF scores. Dietary intake was assessed with a validated semiquantitative food frequency questionnaire and health status was self-reported via survey. AICR/WCRF scores (0- 7 points) were calculated using the published algorithm, with higher scores indicating healthier behaviors. Mean scores and correlations with self-reported health status were calculated in R studio.

Results: Participants had a mean age of 36 years, were 92% female, and 43% Hispanic, with a mean overall AICR/WCRF score of 3.14 ± 1.19 . There was a positive correlation between the AICR/WCRF score and self-reported health status ($r=0.20$, $p<0.0001$). Lowest scores were observed among those with poor health status (2.63 ± 1.22) and highest among those with excellent health (4.01 ± 1.34); differences between poor, fair, good, very good, and excellent health status were significant ($p<0.0001$).

Conclusion: The AICR/WCRF score distinguished between those with 'poor/fair' versus 'very good/excellent' health. These findings support the score's utility among populations with low-income and provide a foundation for evaluating whether changes in adherence translate to improved health outcomes.

SO.2.13-10

Daily Motivation and Fatigue Predict Accelerometer-Measured Physical Activity in Older Cancer Patients: An Ecological Momentary Assessment Study

M. Brusseau^{1,2}, B. Gallet-Suchet³, G. Dray¹, S. Gendrault², L. Harguem⁴, E. Lehou³, J. Deffrennes³, J. Boiché¹

¹EuroMov Digital Health in Motion, University of Montpellier, Montpellier, France, ²Move in Med, Baillargues, France,

³Montpellier Cancer Institute, Department of Supportive Care, Montpellier, France, ⁴Montpellier Cancer Institute, Department of Clinical Research and Innovation, Montpellier, France

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Older adults with cancer are underrepresented in clinical trials. This population is predominantly inactive, especially during treatment. Ecological momentary assessment (EMA) is a frequently used approach to collect repeated measures in real time in a naturalistic environment, such as motivation toward health behaviors. This study aims to observe motivational predictors related to physical activity among older patients with cancer undergoing daily EMA and accelerometers.

Methods: At baseline, older patients with cancer (≥ 70 years old) completed physical function assessments, malnutrition identification, and a comprehensive geriatric assessment. Afterwards, participants took part in an EMA data collection and wore a hip-worn triaxial accelerometer (ActiGraph GT3X-BT) for two weeks. The EMA questionnaires have been sent three times per day via smartphones or computers: in the morning, at midday and in the evening. Intention, affective and instrumental attitudes, social norms, perceived behavioral control and fatigue were collected in the morning and at midday. Physical activity was measured continuously by the accelerometer, time segments have been defined corresponding to the morning and afternoon. The analyses were performed using Multilevel Vector Autoregressive (mIVAR).

Results: 41 patients were recruited and data from 34 participants (mean age = 80 years) were eligible. Half of these participants underwent chemotherapy during the 2-week data collection period. The average level of compliance with the EMA was 81%, while the average level of compliance concerning the accelerometers was 77%. Patients performed an average of 173 minutes of light-intensity physical activity and 18 minutes of moderate-intensity physical activity (intensity threshold = 70mg) per day during data collection. The mIVAR results highlighted the potential of intention to positively predict physical activity at moderate intensity ($\beta = 0.19$, $p = 0.01$). This same behavior predicts itself negatively at the subsequent time point ($\beta = -0.13$, $p = 0.04$). Concerning low-intensity physical activity, fatigue was a negative predictor, and the only one ($\beta = -0.10$, $p = 0.04$).

Conclusion: Our repeated measures protocol highlighted the potential of intention and fatigue to predict physical activity levels throughout the day among older patients with cancer, depending on the intensity of practice.

SHORT ORALS

SO.2.13-11

Daily Motivation Influences Dietary Intake in Older Cancer Patients: An Ecological Momentary Assessment Study

M. Brusseau^{1,2}, B. Gallet-Suchet³, G. Dray¹, S. Gendrault², L. Harguem⁴, E. Lehou³, J. Deffrennes³, J. Boiché¹¹EuroMov Digital Health in Motion, University of Montpellier, Montpellier, France, ²Move in Med, Baillargues, France,³Montpellier Cancer Institute, Department of Supportive Care, Montpellier, France, ⁴Montpellier Cancer Institute, Department of Clinical Research and Innovation, Montpellier, France

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Older adults with cancer struggle to maintain recommended levels of nutrition, especially during treatments. Ecological momentary assessment (EMA) is an approach commonly used to collect repeated measures in real time in a naturalistic environment, such as motivation. This study aimed to identify motivational predictors related to dietary intake and to explore potential subgroups of patients with similar patterns of relations between motivation and nutrition intake among older patients with cancer.

Methods: Older patients with a cancer (≥ 70 years old) completed malnutrition identification, physical capacity assessments and a comprehensive geriatric assessment with G-code. After that, participants engaged in a 2-week EMA data collection. EMA questionnaires were delivered via smartphones or computers. Motivational constructs based on the Theory of Planned Behavior and fatigue were collected in the morning and at midday. Dietary intake was collected at midday and in the evening. The data were analyzed with Multilevel Vector Autoregressive Models and k-means clustering.

Results: 41 patients were recruited and data from 34 participants (mean age = 80 years) were eligible. Half of these participants underwent chemotherapy during the 2-week data collection period. With a mean compliance rate of 80% in this sample, EMA method offers a framework for exploring the temporal evolution and contextual variability of psychological mechanisms. mIVAR results revealed that higher intention and perceived behavioral control predict higher dietary intake within individuals, indicating that daily fluctuations in these motivational variables influence their following dietary intake. We obtained three clusters of participants ($n = 4, 22, 8$ respectively), based on each individual's β coefficients predicting dietary intake from the temporal effects of the mIVAR. Intention and perceived behavioral control positively predicted dietary intake across all clusters, while the role played by attitudes differed between clusters.

Conclusion: Our repeated measures protocol highlighted the potential of motivational variables from the Theory of Planned Behavior to predict dietary intake at the subsequent time point among older patients with cancer. Future research should explore whether adherence to dietary interventions could be facilitated by promoting higher and more stable levels of perceived behavioral control and intentions and how to optimize attitudes, particularly during chemotherapy.

SO.2.13-12

Fruit and Vegetable Consumption, Plasma Carotenoid Concentrations and Risks of Recurrence and Progression in Patients with Non-muscle-Invasive Bladder Cancer

A. Vrieling^{1,2}, J. Kiebach¹, M. Balvers³, K.K. Aben^{1,4}, A.G. van der Heijden⁵, E. Kampman³, L.A. Kiemeny^{1,5}¹Radboud University Medical Center, IQ Health Science Department, Nijmegen, Netherlands, ²Radboud University Medical Center, Department of Primary and Community Care, Nijmegen, Netherlands, ³Wageningen University & Research, Division of Human Nutrition and Health, Wageningen, Netherlands, ⁴Netherlands Comprehensive Cancer Organisation, Department of Research and Development, Utrecht, Netherlands, ⁵Radboud University Medical Center, Department of Urology, Nijmegen, Netherlands

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Fruit and vegetable consumption may decrease bladder cancer risk, but research on its relation to outcomes of non-muscle-invasive bladder cancer (NMIBC) is scarce. Therefore, we investigated the association of fruit and vegetable consumption, as well as plasma carotenoid concentrations, with risk of recurrence and progression in patients with NMIBC.

Methods: Data from patients with newly diagnosed NMIBC between 2014-2021 from the prospective multi-centre cohort UroLife was used. Self-reported information about diet using a Food Frequency Questionnaire, as well as information on other lifestyle factors, was collected at 3 and 15 months after diagnosis (n=1,306). Carotenoid concentrations were measured in non-fasting heparin plasma collected at 3 months after diagnosis (n=850) and log₂-transformed for analyses. Multivariable proportional hazards regression analyses were performed to obtain hazard ratio's (HRs) and 95% confidence intervals (CIs) for the association of fruit and vegetable consumption (per 100 g/day), plasma carotenoid concentrations and risks of recurrence and progression.

Results: Median follow-up time was 4.7 years, 466 patients had at least one recurrence, and 155 showed stage and/or grade progression. Total fruit and vegetable consumption at 3 months after diagnosis was inversely associated with recurrence risk (HR=0.91, 95%CI 0.85, 0.99). Associations for vegetable (HR=0.87, 95%CI 0.76, 1.00) and fruit consumption (HR=0.92, 95%CI 0.84, 1.02) were in the same direction. In stratified analyses, associations were only observed for Ta tumour stage, low or intermediate 2019 EAU risk group, and former or current smokers. For data collected at 15 months after diagnosis, only fruit consumption was inversely associated with recurrence risk (HR=0.88, 95%CI 0.76, 1.02). The correlation between fruit and vegetable consumption and plasma carotenoid concentrations was low (r=0.28). Total and individual plasma carotenoid concentrations were not associated with recurrence risk. No associations with progression were observed.

Conclusion: Higher fruit and vegetable consumption was associated with decreased recurrence risk in patients with less aggressive tumours and (ex-)smokers. Plasma carotenoids were not associated with recurrence risk. For progression, no associations were found. Future studies are needed to confirm our findings and further elucidate the role of fruit and vegetable consumption and related biomarkers with recurrence and progression risk of NMIBC.

SO.2.13-13

Vitamin D Levels and Risk of Non-muscle Invasive Bladder Cancer Recurrence and Progression: Observational and Mendelian Randomization Analyses

J. Kiebach¹, T.E Galesloot¹, K.KH Aben^{1,2}, A.G van der Heijden³, J.MW van den Ouweland⁴, L.ALM Kiemeny^{1,3}, F.JB van Duijnhoven⁵, A. Vrieling^{1,6}

¹Radboud University Medical Center, IQ Health Science Department, Nijmegen, Netherlands, ²Netherlands Comprehensive Cancer Organisation, Department of Research and Development, Utrecht, Netherlands, ³Radboud University Medical Center, Department of Urology, Nijmegen, Netherlands, ⁴Canisius-Wilhelmina Hospital, Department of Clinical Chemistry, Nijmegen, Netherlands, ⁵Wageningen University & Research, Division of Human Nutrition and Health, Wageningen, Netherlands, ⁶Radboud University Medical Center, Department of Primary and Community Care, Nijmegen, Netherlands

SO.2.13 Cancer prevention and management: Exercise, Physical Activity, and Lifestyle Factors Across the Cancer Continuum

Room 4, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Patients with non-muscle invasive bladder cancer (NMIBC) have a high risk of tumor recurrence. Higher vitamin D [25-hydroxyvitamin D, 25(OH)D] levels have been associated with lower recurrence risks for various cancer types. Large studies in patients with NMIBC are lacking, and a potential causal link remains unclear. Therefore, this study investigated the association between both measured and genetically predicted 25(OH)D levels and the risks of recurrence and progression in patients with NMIBC.

Methods: We included 1,301 patients with newly diagnosed NMIBC between 2014-2021 from the prospective multi-center cohort UroLife. Total plasma 25(OH)D levels were measured at 3 (3mo) and 15 months (15mo) post-diagnosis, along with self-reported information on lifestyle factors. Clinical data were obtained from medical records. The association of 25(OH)D levels at 3mo, and as time-varying exposure at 3mo and 15mo, with the risks of first recurrence, multiple recurrences, and stage and/or grade progression was assessed using multivariable Cox proportional hazards models. Furthermore, two-sample Mendelian Randomization (MR) analyses were performed to assess the causal effect of 25(OH)D levels on recurrence and progression risk in 6 NMIBC cohorts (n=5,008), using summary data on 25(OH)D levels from publicly available genome-wide association studies for genetic instrument selection (n=401,460).

Results: Over a median follow-up period of 4.8 years, 464 patients had at least one recurrence and 153 had progression. Higher 25(OH)D levels were not associated with the risks of first recurrence, multiple recurrences, and progression (HR

SHORT ORALS

0.99, 95%CI 0.95, 1.03; HR 1.00, 95%CI 0.96, 1.04; HR 0.99 95%CI 0.92, 1.07 per 10nmol/L, respectively). By contrast, among vitamin D/multivitamin supplement users, higher 25(OH)D levels were associated with lower recurrence risk (HR 0.85, 95%CI 0.77, 0.94). Associations with recurrence or progression risk were not significant in stratified analyses according to other clinical and lifestyle factors. MR analyses showed no nominal significant associations between genetically predicted 25(OH)D levels and risks of recurrence and progression.

Conclusion: The findings from our observational study and causal MR analyses did not show a beneficial role of higher 25(OH)D levels for the risk of NMIBC recurrence and progression, but further research, particularly to explore the involvement of vitamin D supplement use, is warranted.

SO.2.14-01

Translating Evidence into Impact: A Systematic Review of Implementation Science Approaches in Nutrition and Physical Activity Interventions in Global Community-based Settings

S. Given¹, H. Leili², F. Hesam Shariati¹, S. Wilcox³, L. Balis⁴, A. Kaczynski¹

¹University of South Carolina, Health Promotion, Education, and Behavior, Columbia, SC, United States, ²University of South Carolina School of Medicine, Columbia, SC, United States, ³University of South Carolina, Prevention Research Center, Columbia, SC, United States, ⁴Center for Nutrition and Health Impact, Omaha, NE, United States

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools
Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Mounting evidence shows that the translation and dissemination of efficacious nutrition and physical activity (PA) interventions into sustainable community practice remains limited. Implementation science (IS) uses contextual frameworks and models to provide a means to understand how implementation strategies impact implementation outcomes and population health. However, the use of IS in nutrition and PA interventions in community-based settings (e.g., schools, faith-based organizations, community centers) is not well understood. The purpose of this study was to systematically review evidence on the use of IS within nutrition and PA community-based interventions.

Methods: We conducted a systematic search following PRISMA guidelines across PubMed, Web of Science, Scopus, and PsycINFO in May 2025. Eligible studies implemented nutrition and/or PA interventions in community settings across the globe that explicitly applied an IS framework/model. For all eligible studies, data were extracted on study characteristics, setting, IS frameworks/models (e.g., RE-AIM, CFIR), implementation strategies (e.g., use of data experts, ongoing training opportunities), adaptations (e.g., changes in language used, duration of program sessions, additional materials or resources), and implementation outcomes (i.e., acceptability, adoption, appropriateness, feasibility, fidelity, cost, penetration, and sustainability).

Results: 49 eligible studies were identified. They were conducted in diverse countries, including Australia, Belgium, Denmark, Canada, Sweden, the United Kingdom, and the United States, and 39 (79%) of the articles were published since 2019. Studies varied in the types of community-based settings with the majority occurring in faith-based organizations (n=10, 20%), schools (n=10, 20%), senior centers (n=6; 12%), neighborhoods (n=5, 10%), and early childcare centers (n=4; 8%). Of the 49 interventions, 19 (39%) focused on PA, 17 (35%) on both nutrition and PA, and 13 (27%) on nutrition. Additional data extraction will be completed by December 2025. Final results will describe the IS frameworks/models used, common implementation strategies, and reported implementation outcomes.

Conclusion: Preliminary insights demonstrate increasing utilization of IS approaches in community-based nutrition and PA interventions, yet application of frameworks/models and reporting of implementation strategies and outcomes remain inconsistent. The completed synthesis will offer recommendations to advance methodological rigor and facilitate more effective translation of nutrition and PA interventions into community practice.

SO.2.14-02

The PIECES Multi-site Comparative Case Study: Mixed Methods Implementation Evaluation of Adapting, Implementing and Tailoring Primary Cancer Prevention Programs in Diverse Contexts

N. Hensen¹, R. Smit¹, C. Vis¹, H. van der Ploeg¹, C. Martinez², F. van Nassau¹, PIECES Consortium

¹Amsterdam UMC, Public and Occupational Health, Amsterdam, Netherlands, ²Institut Català d'Oncologia, Barcelona, Spain

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools

Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Effective implementation of evidence-based programs in real-world settings depends not only on availability but also on the ability to adapt programs and tailor implementation strategies to local contexts. Although many frameworks describe these processes, practical guidance for applying them in practice remains limited. The PIECES toolkit was developed to address this gap by providing structured, theory- and evidence-informed guidance for selecting, adapting, implementing and evaluating primary cancer prevention (PCP) programs, including physical activity programs. We theorised that the toolkit contributes to strengthening implementation capacity and competencies of implementers through structured planning, collaborative learning, and evidence-informed decision-making.

Methods: In November 2025, the toolkit is being used by 25 implementation teams in Europe in settings such as public health institutes, local communities, schools, occupational health units, hospitals, and car companies. Teams use the toolkit to implement programs targeting key cancer risk factors including nutrition and physical activity behaviour. A mixed-methods evaluation examines usability, feasibility, satisfaction, and perceived impact, alongside contextual influences. The primary outcome is change in implementation competencies among toolkit users. Guided by the UK MRC Process Evaluation Framework and Proctor's implementation outcomes, data are collected through surveys, interviews, toolkit logs, and field notes at baseline and six-month intervals (2025–2027).

Results: Baseline data (N=69) showed that most toolkit users are healthcare professionals (65.2%) or healthcare researchers (35.2%), with limited prior implementation experience (58.0%) or formal training in implementation (63.8%). At baseline, users most frequently felt skilled in incorporating stakeholder perspectives (52%), using evidence to tailor strategies (49%), and assessing program-context fit (49%), while fewer reported confidence in measuring outcomes (27%), stakeholder engagement (26%), and developing implementation strategies (26%). Interviews revealed diverse recruitment strategies, strong motivation to structure implementation processes, and challenges related to time, experience, and contextual constraints such as funding and organizational alignment.

Conclusion: This study contributes to our understanding of how implementation support tools function across diverse contexts. At baseline, users indicated strongest skills in stakeholder inclusion and evidence use, and lower confidence in developing strategies and measuring outcomes. Initial insights highlight both enthusiasm and practical barriers to toolkit use. Long-term evaluation results will inform optimal toolkit use in practice.

SO.2.14-03

Bridging Child Health Research and Policy: Tools for State-level Knowledge Translation from the TX RPC Project

S. Flores-Thorpe^{1,2}, Y. Zhang^{3,2}, T. Menendez^{3,2}, R. Linton^{3,2}, K. Brand^{3,2}, S. Kelder^{3,2}, A. van den Berg^{3,2}, D. Hoelscher^{3,2}

¹UTHealth Houston School of Public Health - NCI Cancer Control Research Training Program, Austin, United States,

²Michael & Susan Dell Center for Healthy Living, Austin, United States, ³UTHealth Houston School of Public Health, Austin, United States

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools

Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Translating research findings into policy is often hindered by significant delays and communication barriers. Strengthening collaboration between researchers and policymakers through effective communication tools can help bridge this gap, yet knowledge translation models remain limited. This abstract describes the tools and process evaluation metrics developed by the Texas Research-to-Policy Collaboration (TX RPC) Project to accelerate research-to-policy translation.

SHORT ORALS

Methods: Needs assessments were conducted with policymakers (n=43) to identify health policy priorities and anticipated needs before three Texas legislative sessions (2021, 2023, and 2025). Drawing on these data, prior studies, policy theory, and legislative practices, TX RPC developed and implemented tools and resources to enhance researcher–policymaker engagement. Process evaluation metrics, including the number of resources produced, website views, and event attendance, were used to assess reach.

Results: Legislators identified priority health policy areas, including food security, maternal and child health, chronic disease and cancer prevention, mental health, tobacco use, and healthcare access. In response, TX RPC created and disseminated key resources such as:

- Health Policy Resource Reports aligned with legislative priorities (food security = 15; maternal health = 8; mental health = 9; tobacco = 2; healthcare = 1);
- Texas Child Health Status Reports, translating state-level child health data from the Texas School Physical Activity and Nutrition (Texas SPAN) survey into accessible visuals and actionable recommendations (n = 12);
- Lunch & Learn sessions at the State Capitol featuring subject experts (food policy = 3; maternal health = 1; healthcare = 1; mental health = 1); and
- One-hour webinars on health topics of interest to Texas legislators, archived for continued access.

Additionally, more than 55 e-newsletters were distributed to over 400 legislators and staff, and the Texas Legislature Bill Tracker was developed to monitor health-related legislation for community partners.

Conclusion: The TX RPC Project provides a scalable model for accelerating knowledge exchange between health researchers and state policymakers. Ongoing investment in relationship-based and data-driven communication strategies can further strengthen the integration of research evidence into state health policy.

SO.2.14-04

Development of a Scalable Method to Identify Privately-managed Parks and Playgrounds and Improve Park Access Equity

A. Hipp¹, K. Burford¹, J. Han¹

¹North Carolina State University, Parks, Recreation, and Tourism Management, Raleigh, United States

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools
Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose:

The lack of availability and accessibility data of privately-managed parks is a major limitation for cities striving to achieve equitable park and recreation access. The Trust for Public Land's (TPL) ParkScore, which is widely adopted by US cities, only includes publicly-managed parks. To address these data gaps, this research presents a novel methodology for identifying, assessing, and integrating privately-managed parks into urban park accessibility metrics, using Raleigh, North Carolina, as a test case. Scalable processes will be shared.

Methods:

The initial (Raleigh, NC) research methodology encompassed four key components: (1) development of a systematic approach to identify privately-managed parks through both local government resources and national datasets; (2) creation and validation of public accessibility criteria for privately-managed parks; (3) establishment of a comprehensive geospatial database; and (4) analysis of the TPL ten-minute walk accessibility scenarios.

The scalable phase methodology utilizes a national (U.S.) land use parcel-level dataset (Regrid) and an international park and playground dataset (OpenStreetMap) to replicate and scale workflows.

Results: Using a Python-based workflow within ArcGIS, Regrid, and OpenStreetMap, that will be shared in detail, we initially identified 148 privately-managed land use parcels that contain at least park and recreation amenities and space. Researcher verification through satellite and Google Street View imagery confirmed 61 privately-managed parks - that were not swimming pool-only. This represents 41% sensitivity without researcher validation and 100% sensitivity with limited researcher validation. The TPL ten-minute walk accessibility analysis indicated that residential park access increased by 21% (42% to 51% across the city of 500,000) with the addition of the privately-managed parks to the existing TPL ParkScore.

Conclusion: In Raleigh, the identification of 61 privately-managed parks contributes meaningfully to the city's overall park infrastructure, access, and opportunities for physical activity. Our research team is now working with data from five additional US cities, and TPL, to scale up our method, expand our classification of privately-managed parks (e.g., multifamily housing complexes), and improve validation methods (ground truth-ing). Fidelity, feasibility, and adoption of the expanded method will be available in early 2026 and will be shared.

SHORT ORALS

SO.2.14-05

Child Healthcare Nurses' Perspectives of Determinants Regarding the Sustainability of MINISTOP 3.0 in Swedish Child Healthcare

C. Delisle Nyström^{1,2}, M. Lundgren¹, M. Löf^{1,2}, M. Fagerström³, K. Hesketh², K. Thomas³

¹Karolinska Institutet, Department of Medicine, Huddinge, Sweden, ²Deakin University, Institute for Physical Activity and Nutrition (IPAN), Geelong, Australia, ³Linköping University, Department of Health, Medicine and Caring Sciences, Linköping, Sweden

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools
Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: MINISTOP is a 6-month digital intervention designed to support parents of preschool children in establishing healthy lifestyle behaviors. While many studies have explored the determinants of implementing digital interventions in healthcare, few have examined how they can be sustained over time. This study aimed to explore the sustainability of the large-scale implementation of MINISTOP within Swedish child healthcare.

Methods: MINISTOP 3.0 is a type III implementation-effectiveness trial using a cluster randomized controlled trial design. Child healthcare centers were randomized to either basic or enhanced implementation support. Sustainability, defined as the continued delivery of MINISTOP during routine health visits for children aged 2.5–3 years was assessed through individual telephone interviews with nurses at least 12 months after implementation. A purposive sample of 16 nurses from both implementation groups, including high and low adopters, participated. Data was analyzed using inductive reflexive thematic analysis with a latent approach.

Results: Three main themes emerged: *end users, finding your own way, and team dynamics and ongoing support*. Parents were seen as key partners in the implementation process, with their engagement influencing nurses' decisions to offer the app. While some nurses expressed concerns about parental screen time or competing family priorities, the perceived benefits for families were strong motivators for sustained use. Nurses emphasized the importance of developing personal strategies and adapting MINISTOP to fit existing routines. Familiarity with the MINISTOP app and registration system helped build confidence, particularly among high adopters. Finally, supportive co-workers and shared learning opportunities such as seminars and follow-ups were critical for both early and sustained implementation. Team collaboration and ongoing professional development helped nurses overcome barriers and maintain motivation.

Conclusion: This study provides valuable insights into the factors influencing the sustained implementation of a digital health intervention in routine child healthcare. Identified facilitators and barriers such as end-user engagement, individualized implementation strategies, and team support may inform future efforts to implement similar interventions in comparable healthcare settings.

SO.2.14-06

Linking Organizational Readiness to Adherence in a School-based Health Promotion Program – The Healthy School Start

J. Álvarez Ahlgren¹, L. Schäfer Elinder¹, S. Andermo², K. Sidney Annerstedt¹

¹Karolinska Institutet, Global Public Health, Stockholm, Sweden, ²Karolinska Institutet, Neurobiology, Care Sciences and Society, Stockholm, Sweden

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools
Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Overweight and obesity remain major global health challenges. Evidence-based school programs such as *Healthy School Start (HSS)* are effective when implemented with high fidelity, yet real-world delivery often varies due to contextual and organizational factors. Staff readiness, defined as the collective commitment and confidence to implement change, is a key driver of adherence. Early implementation outcomes, including perceived acceptability, appropriateness, and feasibility, may strengthen or weaken this link. This study examines the relationship between staff readiness and adherence to the Motivational Interviewing (MI) component of the HSS program, and explores whether early implementation outcomes moderate this relationship.

Methods: We conducted a longitudinal observational study nested within a larger implementation trial across three municipalities in Stockholm over two academic years. School staff (nurses and principals) completed a validated

SHORT ORALS

Swedish version of the Organizational Readiness for Implementing Change (ORIC) tool and measures of acceptability, appropriateness, and feasibility at baseline. Adherence to MI – one critical component of the HSS program – was extracted from school nurse records and operationalized as the proportion of caregivers receiving MI sessions. A generalized linear model was used to examine the association between readiness among school staff and the proportion of MI interviews delivered, adjusting for clustering at the school level. Covariates included academic year, organizational stability of the school, and school size. Interaction terms tested moderation by acceptability, appropriateness, and feasibility.

Results: The sample included 37 school nurses and 33 school principals from 41 schools. Readiness showed a small (non-significant) positive association with MI adherence ($\beta = 0.004$, $p = 0.67$, 95% CI: -0.02, 0.03). No significant interaction effects were found for acceptability, appropriateness or feasibility.

Conclusion: The small and non-significant association between staff readiness and MI adherence suggests that factors beyond readiness and early implementation outcomes may drive MI adherence. Future research should consider cross-cultural validation, context and larger sample sizes. Limitations include potential measurement issues due to the use of translated versions of the instruments, and unmeasured contextual factors such as language barriers between caregivers and school nurses that could have an influence on adherence.

SO.2.14-07

How Much Physical Activity Is Accumulated in Physically Active Lessons? A Comparison with Physical Education Lessons

F.J. Bandera-Campos^{1,2}, M. González-Pérez^{1,2}, F. Martín-Acosta^{1,2}, M. Vaquero-Solís³, D. Sánchez-Oliva^{3,1,2}, A. Grao-Cruces^{1,2}

¹University of Cadiz. GALENO Research Group, Department of Physical Education, Puerto Real (Cadiz), Spain, ²Instituto de Investigación e Innovación Biomédica de Cádiz (INIICA), Cadiz, Spain, ³University of Extremadura. SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools
Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Increasing physical activity (PA) in adolescents is a public health priority, and schools represent a key setting for implementing PA promotion strategies. Physically Active Lessons (PAL) have been endorsed by the World Health Organization as an emerging curricular approach to increase PA levels during the school day. However, evidence is still limited regarding whether PAL implemented in real-world secondary school settings achieve optimal PA levels. Taking Physical Education (PE) as the reference point—given its established role as the traditional curricular strategy for promoting PA—the aim of the present study was to evaluate the distribution of PA intensities during PAL and compare them with PE.

Methods: Sedentary time (ST) and PA intensities were device-measured using wrist-worn accelerometers over eight consecutive days at two timepoints during the MOVESCHOOL intervention. MOVESCHOOL was a 29-week quasi-experimental study that included one weekly PAL and additional active strategies. For the experimental group, two PAL session and four to six PE lessons per participant were extracted and averaged for analysis. A total of 217 secondary school students (aged 12–14 years; 42.4% female) with valid accelerometer data in both PAL and PE were included. Descriptive statistics were calculated, and a one-factor ANCOVA (PAL vs PE) was conducted, adjusting for age, sex, and body mass index.

Results: During PAL, time spent in MVPA reached 13.67%, which was substantially lower than the proportion accumulated during PE lessons at these intensities (23.24%; $p < .001$). ST during PAL (44.34%) was significantly higher compared to PE (37.44%; $p < .001$). No further statistically significant differences were observed, with LPA values being similar between PAL and PE lessons (44.25 and 42.66%, respectively; $p > .05$).

Conclusion: PAL contributed 13.67% of the curricular time that is typically sedentary towards MVPA, although this contribution was to a lesser extent than that provided by PE lessons. Teachers should weigh the potential physical benefits of PAL together with their educational value in non-PE subjects, and strategically decide how to use them. Finally, it is suggested that integrating PAL alongside PE could further increase PA exposure and reduce sedentary time across the school day.

SO.2.14-08

Readiness in Action: How Leadership, Support, and Role Clarity Shape Implementation in School-based Physical Activity

T. Skovgaard¹, L.B.S. Christiansen¹, J. Vestergaard Nielsen¹, S. Koch¹

¹SDU, Department of Sports Science and Clinical Biomechanics, Odense, Denmark

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools

Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Organizational readiness for change - defined as shared change commitment and change efficacy (Weiner, 2009) - is critical for implementing schoolbased physical activity (PA) initiatives yet is rarely operationalized across diverse educational contexts. This study adds empirical and conceptual depth by integrating data from three Danish initiatives (SHP, PHASAR and GHK) to examine how leadership, support structures, and role clarity shape readiness.

Methods: We conducted a qualitative cross-case analysis of interviews with school principals and local champions (n=61) across 43 schools participating in SHP, PHASAR, and GHK. Transcripts were reviewed with attention to Weiner's constructs and explored for emerging patterns related to leadership, support, and role-related patterns.

Results: Readiness was stronger where school leaders framed PA and other intervention components as a core educational priority. This framing supported shared resolve and willingness among implementation actors (commitment) and created conditions that bolstered change efficacy - task demands seemed manageable, resources available, and context supportive. Across cases, readiness was strengthened when implementation roles were clearly defined, peer or structural support was in place, and school leadership followed through with concrete planning and delegation. Conversely, passive leadership or unclear role structures led to stalled or superficial implementation.

Conclusion: This multi-case re-analysis demonstrates that leadership, support systems, and clear role allocation are critical to building organizational readiness for school-based PA initiatives. Strengthening commitment and efficacy early can enhance sustained program implementation. Future research should examine how readiness evolves over time and how system-level factors - such as crosssectoral collaboration - interact with school-level readiness to influence outcomes. Strengthening these connections may improve the scalability and sustainability of future PA initiatives.

SO.2.14-09

Effects of a Classroom-based Active Break Program on Executive Functions in School Children: Results from the Break4brain Cluster-randomized Controlled Trial

A. Muntaner-Mas¹, M. Bodi¹, D. Arenas¹, M. Cortés¹, A. Quilez¹, J. Cantallops¹, D.R. Lubans²

¹University of Balearic Islands, Palma, Spain, ²University of Newcastle, New South Wales, Australia

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools

Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: This study evaluated the effects of a classroom-based active breaks program on executive functions—specifically selective attention and cognitive flexibility—among primary school children. The program integrated short, structured bouts of physical activity into academic time to enhance cognitive performance.

Methods: A cluster randomized controlled trial was conducted across 18 primary schools in the Balearic Islands, involving 555 students (mean age = 11.4 ± 0.9 years; 53% boys, 47% girls). Schools were allocated to an intervention group (n = 280; daily video-based active breaks) or a control group (n = 275; standard classroom routine). The intervention consisted of one 10-minute active break per school day over eight weeks. Executive functions were assessed one week before and after the intervention using the Trail Making Test (cognitive flexibility) and the d2 Test of Attention (selective attention). Data were analyzed using linear mixed-effects models, with school as a random factor and time (pre/post) and group (intervention/control) as fixed factors.

Results: A significant main effect of time was observed across all measures (p < .001), indicating overall cognitive improvement from pre- to post-test. For cognitive flexibility, the group × time interaction was not significant (p > .30), suggesting similar improvements in both groups. In contrast, the d2 concentration score showed a significant

SHORT ORALS

group $\times$ time interaction ($F = 11.63$, $p < .001$), with the intervention group exhibiting greater gains in attention and concentration. The d2 total score also improved significantly over time ($p < .001$), though no between-group differences emerged ($p = .15$).

Conclusion: Integrating active breaks into classroom time enhanced children's attention and concentration but did not significantly affect cognitive flexibility. These findings support the inclusion of movement-based strategies in daily school routines to promote executive functioning and academic performance. Future research should examine optimal intervention doses and long-term effects.

SO.2.14-10

Implementing a Physical Activity Monitoring System as Part of a Whole School Approach: Lessons Learned from the Active School Flag Programme

K. Ng^{1,2,3}, C. Woods¹

¹University of Limerick, Physical Activity for Health Research Centre, Health Research Institute, Department of Physical Education and Sport Sciences, Limerick, Ireland, ²University of Turku, Department of Teacher Training, Turku Institute of Advanced Studies, Turku, Finland, ³Lithuanian Sports University, Institute of Sports Science and Innovation, Kaunas, Lithuania

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools

Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Adolescents are a hard-to-reach group for physical activity (PA) promotion. Whole school approaches are recommended but challenging to operationalise in practice. The Active School Flag (ASF) programme is a multi-stage, multi-component, comprehensive whole-school approach designed, with flexibility, to meet the needs of 12–18-year-olds in schools in Ireland. This paper reviews the added value of an inbuilt 'monitoring system' and its role in achieving effective programme implementation.

Methods: The ASF programme has six core components – monitoring, communication, whole-school initiatives, active school walkway, active school week and school-community links. The monitoring component asks all ASF students to complete a whole school survey at the beginning of each academic year. A completion rate of 50% (year one) to 70% (by year three plus) is required for schools to achieve flag status. Survey items include psychometrically valid self-reported past week PA and sport, as well as mode of transport to and from school. Open-ended questions provided feedback on ASF implementation and suggestions to enhance schools' PA levels.

Results: In 2024, 42 ASF schools completed the ASF whole school survey ($N=19,868$, male = 44%, female = 54%, other gender = 2%). In comparison to national averages, more ASF students reported engaging in daily moderate to vigorous PA (18% ASF vs 12% national average), using public transport for the school commute (35% vs 25%), while similar levels were found for muscle strengthening exercise (43%), for walking (23%) or cycling (3%) to school. In the past year, the ASF walkway was used more by females (65%) than males (56%) and other gender (50%), also by senior (65%) more than junior students (58%), these differences were statistically significant ($p < .001$). Half reported using the walkway during Physical Education (52%), recess time (47%), or active breaks during class (46%).

Conclusion: The ASF inbuilt monitoring system provide nationally relevant data for multiple Government departments, Education, Transport, Sport. It informs implementation of programme components and importantly it activates the students' voice on how to tailor the ASF programme to specific school context.

SO.2.14-11

Augmenting an Adolescent Afterschool Program with College Mentors to Improve Mental Health: A Feasibility Study

K. Hendel¹, D. Erickson¹, M. Beets², M. Laska¹, N. Sherwood¹

¹University of Minnesota School of Public Health, Epidemiology and Community Health, Minneapolis, United States,

²University of South Carolina, Arnold School of Public Health, Columbia, United States

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools

Room 5, May 29, 2026, 2:00 PM - 3:00 PM

SHORT ORALS

Purpose: Afterschool programs can help prevent adolescent depression, but attendance is inconsistent. We partnered with an established afterschool program to create an enhanced version in which college students encouraged participation and mentored adolescents by promoting strategies to improve mental health (i.e., physical activity and mindfulness). This study examined the enhanced program's feasibility.

Methods: This mixed-methods feasibility study used a cross-over design in two middle schools during 2024-25 (n=170 adolescents). Conditions (enhanced program or program as usual) crossed after one semester. We assessed feasibility (i.e., recruitment/retention, acceptability, and implementation fidelity) through attendance records, satisfaction ratings, observations (twice per semester in each afterschool class), and qualitative data from school staff (34 interviews), mentors (18 focus groups), and students (39 focus groups). We computed descriptive statistics and compared differences between conditions with mixed models adjusting for time and the sequence of receiving the two conditions. We used qualitative content analysis to analyze qualitative data.

Results: Initial recruitment was challenged by afterschool staff turnover, but student retention was high (92%). Adolescents attended 57% of program days overall. Attendance was 13.4 percentage points higher during the enhanced program versus program as usual (CI: 0.08-0.20). Among the enhanced program, mentors attended 93% of scheduled days, while all afterschool staff were present on only 46% of program days. Seventy-five percent of adolescents reported often or always enjoying time with mentors. Student satisfaction and engagement were similar across conditions. Implementation fidelity varied in the enhanced condition. Mentors led physical activity on 93% of observed days but less frequently engaged in role modeling, such as sharing personal experiences (59%) or explaining why they value physical activity (57%). Qualitative findings highlighted the importance of afterschool staff involvement to support mentors' physical activity promotion, manage student behavior, and provide structure. Mentors struggled navigating their role, especially when staff were absent.

Conclusion: Findings highlighted challenges of real-world implementation. Enhancing afterschool programming with college mentors appealed to adolescents and improved program attendance. However, revisions are needed to better coordinate mentor and teacher roles for improved implementation fidelity.

SO.2.14-12

Implementation of an Innovative Digital Toolkit for Physical Education Teachers to Promote Physical Literacy and Health in Schools: The FitBack4Literacy Project

M. Molina-Fernandez¹, A. Camacho-Cardenosa^{1,2}, A. Millan-Martin¹, G. Jurak³, F.B. Ortega^{1,4}, J.R. Ruiz^{1,2,4}

¹Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health University Research Institute (iMUDS), University of Granada, Granada, Spain, ²Instituto de Investigación Biosanitaria de Granada (ibs.GRANADA), Granada, Spain, ³Faculty of Sport, University of Ljubljana, Ljubljana, Slovenia, ⁴Centro de Investigación Biomédica en Red: Fisiopatología de la Obesidad y Nutrición (CIBEROBN), Instituto de Salud Carlos III, Madrid, Spain

SO.2.14 Implementation and scalability: Implementing PA and Nutrition Interventions in Schools

Room 5, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: To evaluate the effectiveness and feasibility of a newly developed digital Toolkit, integrated within the FitBack platform, aimed at improving Physical Education (PE) teachers' competence in developing physical literacy by monitoring students' physical fitness in the school setting.

Methods: This pilot study was conducted as part of the European FitBack4Literacy project, representing the experimental site in Spain. A multicenter, non-randomized trial was conducted in six Andalusian secondary schools during the 2024-2025 academic year. Eleven PE teachers (18.2% women; age: 38.7±8.5 years; teaching experience: 13.1±8.8 years) and 613 students (50.2% girls; age: 14.4±1.0 years; body mass index percentile: 54.6±29.1) participated. The intervention included: (i) a structured teacher-training workshop on the FitBack platform and Toolkit use; (ii) implementation of interactive learning scenarios within the PE curriculum; and (iii) ten local and two international cooperative learning sessions. The feasibility and usability of the Toolkit implementation within the PE curriculum were assessed with the User Experience Questionnaire and semi-structured interviews. Teachers' competence in using fitness monitoring to promote physical literacy was measured with the validated Physical Education Teachers' Competence Questionnaire (PETC-Q). Students' physical fitness was measured using the ALPHA test battery, standardized to European reference percentiles. Paired t-tests or Wilcoxon tests were applied for within-subject pre-post comparisons.

Results: Teachers reported high usability, satisfaction, and pedagogical relevance of the Toolkit. PETC-Q scores decreased significantly after the intervention (1.88±0.43 to 1.66±0.28; $P=0.027$), indicating greater professional

SHORT ORALS

self-awareness and reflective practice. Students showed significant improvements in both absolute and relative values of muscular strength (handgrip strength: 27.7 ± 6.6 to 29.9 ± 7.1 kg, $P < 0.001$; percentile 47.1 ± 24.6 to 50.5 ± 24.4 ; $P < 0.001$) and cardiorespiratory fitness (20m shuttle run test: 4.2 ± 2.3 to 4.8 ± 2.2 stages, $P < 0.001$; percentile 42.4 ± 28.3 to 49.6 ± 27.0 ; $P < 0.001$).

Conclusion: Implementation of the FitBack Toolkit showed an effect of increased awareness and professional self-criticism among teachers and improved students' muscular and cardiorespiratory fitness relative to European norms. The Toolkit offers a feasible, low-cost, and scalable strategy to promote physical literacy and health in schools.

SO.2.15-01

Defining Intuitive Movement: Toward a Wellbeing-oriented Perspective in Physical Activity

M. Lacoursière¹, S. Girard¹, S. Stoloff¹

¹Université du Québec à Trois-Rivières, Department of Human Kinetics, Trois-Rivières, Canada

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Traditional approaches to physical activity often emphasize prescription and performance, which can undermine autonomous motivation and wellbeing. In contrast, intuitive movement promotes a flexible and self-compassionate engagement in physical activity, prioritizing wellbeing over appearance-driven goals. Despite increasing interest in this approach, the absence of a clear conceptual foundation hinders its application in research and practice. This study, through a conceptual analysis, aims to unify the concept of intuitive movement and identify its defining attributes.

Methods: This conceptual analysis followed a seven-step modified approach of Walker and Avant (2014). The process began with a comprehensive review of publications between 2004 and 2024 in the fields of psychology and physical activity. Sources included Google Scholar, APA PsycInfo and SportDiscus. Keywords combined intuitive-related and movement-related terms: (*intuitive OR attunement OR mindfulness OR embodiment OR empowering*) AND (*physical activity OR exercise OR fitness OR movement OR training*). The lack of restrictive criteria allowed access to a greater number of sources. References, including related terms and titles citing these works, were reviewed to enrich the analysis. Studies were included if they contained at least two of the four categories from the *Intuitive Exercise Scale* (Reel et al., 2016). Attributes were extracted and categorized through thematic synthesis and pattern coding (Miles et al., 2014).

Results: The conceptual analysis revealed six defining attributes of *intuitive movement*: mindful awareness, embodiment, emotional attunement and well-being, value-based autonomy, adaptability, and positive body image. These attributes emerged across six disciplinary perspectives: athletic performance, therapeutic practice, meditative exercise, educational contexts, body awareness, and physical activity psychology. This finding highlights interdisciplinary breadth. The analysis produced a unified definition: *engaging in physical activity mindfully and nonjudgmentally, in alignment with the body's cues and values, while promoting positive body image, emotional acceptance, and rejecting diet mentality*.

Conclusion: By providing a unified definition, this study enhances conceptual clarity, enabling the development of educational tools and targeted interventions that promote mental health and harmony within physical activity. Establishing a robust framework for intuitive movement facilitates interdisciplinary dialogue, ensuring that both researchers and practitioners can leverage its principles to foster inclusive, autonomy-supportive, and wellbeing-oriented physical activity experiences.

SO.2.15-02

Affective States and Physical Activity Intensity in Psychologically Distressed Middle-aged Women: Findings from Exer-WAPA Project

N. Zurita-Corvalán¹, D. Rodriguez-Sanchez¹, J. Lebrón-Roldán¹, L.M. Arcediano¹, A. Ramírez-Osuna¹, V.M. Valle Muñoz¹, M. Ávila García^{2,3}, M. Atencia-Rodríguez¹, A. Astarriaga-Aguilar¹, J.M. Segura Díaz⁴, A. Lara-Rodríguez¹, D. Tavío Solís¹, E. Villa-González¹, Y. Barranco-Ruiz¹

¹University of Granada, Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health

SHORT ORALS

University Research Institute (iMUDS), Granada, Spain, ²University of Granada, “La Inmaculada” Teacher Training Centre, PA-HELP Physical Activity for Health Promotion Research Group, Sport and Health University Research Institute (iMUDS), Granada, Spain, ³Universidad Isabel IS, Burgos, Spain, ⁴University of Seville, Department of Human Movement and Sport Performance, Seville, Spain

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: To examine the association between affective states and the intensity and duration of weekly physical activity in psychologically distressed middle-aged women.

Methods: This cross-sectional study, part of the Exer-WAPA project (Ref: C-SEJ-304-UGR23), included a total of 59 inactive women (aged 35 to 60 years; mean age: 47.7 ± 7.2) from the city of Granada and its surrounding areas. Affective states were assessed using the Spanish version of the Positive and Negative Affect Schedule (PANAS). Weekly physical activity intensity and duration (min), [vigorous (VPA), moderate (MPA), moderate-to-vigorous (MVPA), light (LPA), and total (TPA)] were estimated using the short form of the International Physical Activity Questionnaire (IPAQ-SF). Spearman's rho (ρ) correlations were used to analyse the associations between affect scores (positive [PA], and negative [NA]) and different physical activity intensities and durations. A significance level of $p < 0.05$ was set for all analyses.

Results: A total of 54.2% of the women were married, and 73.2% had completed high school and/or university education. Mean affect scores for PA and NA were 24.1 ± 7.2 and 24.9 ± 7.5 , respectively. Mean weekly physical activity was 14.1 ± 45.9 min for VPA, 22.6 ± 43.8 min for MPA, 36.9 ± 80.4 min for MVPA, 186.4 ± 188.4 min for LPA, and 202.9 ± 188 min for TPA. Furthermore, a positive and significant correlation was observed between PA and minutes of VPA ($\rho = 0.334$, $p = 0.010$), as well as a positive but non-significant trend with MVPA ($\rho = 0.258$, $p = 0.055$). In contrast, NA was negatively and significantly associated with MPA ($\rho = -0.427$, $p = 0.001$) and with total MVPA ($\rho = -0.395$, $p = 0.003$). No significant correlations were found between PA and NA with either LPA or TPA.

Conclusion: PA was related to higher VPA, while NA was inversely associated with MPA and MVPA in psychologically distressed women. Since higher PA and lower NA were positively associated with overall well-being, these results emphasize the value of engaging in physical activity at appropriate intensities to foster emotional health and enhance overall psychological well-being in this population.

SO.2.15-03

Severity of Depression and Anxiety Manifest in Physical Activity and Nocturnal Sleep Metrics Collected from a Consumer-grade Wearable Ring

S. Azadifar¹, A. Sameh¹, M. Niemelä^{1,2}, L. Nauha¹, M. Kärmeniemi³, V. Farrahi^{4,1}

¹University of Oulu, Research Unit of Health Sciences and Technology, Oulu, Finland, ²University of Oulu, Centre for Wireless Communications, Oulu, Finland, ³University of Oulu, Research Unit of Population Health, Oulu, Finland, ⁴TU Dortmund University, Institute for Sport and Sport Sciences, Dortmund, Germany

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Modern wearable devices generate a multitude of digital metrics which can be indicators of various health conditions and status. This study investigated whether and how digital metrics generated from a consumer-grade smart ring were different in individuals with varying severity of depression and anxiety symptoms in a large population-based cohort.

Methods: Data were obtained from the Northern Finland Birth Cohort 1986 when participants were 33–35 years of age. Participants were asked to wear the Oura Ring for two weeks, which provided digital measures of sleep architecture, nocturnal heart rate (HR), nocturnal heart rate variability (HRV), and minute-by-minute movement intensity. Participants with at least 4 valid measurement days with no less than wear time of 15 hours were included. Depression and anxiety symptoms were assessed using the Generalized Anxiety Disorder 7-item scale (GAD-7) and the Hopkins Symptom Checklist-25 (HSCL-25). Participants were grouped into no, mild, and moderate-to-severe anxiety symptom categories based on GAD-7, and with and without depression and anxiety symptoms based on HSCL-25. Time series data were visualized, and statistical differences between groups were assessed using one-way ANCOVA followed by Tukey's post hoc test.

Results: A total of 1,290 participants provided enough valid data and were included. The metrics generated by Oura ring were different across symptom severity groups. Participants with moderate-to-severe anxiety assessed by GAD-7

SHORT ORALS

and with depression and anxiety symptoms assessed by HSCL-25 exhibited lower proportions of rapid eye movement (REM) and deep sleep, and increased light sleep compared with the group without depression and anxiety. These two groups also showed elevated HR, reduced HRV during sleep, and lower levels of moderate-to-vigorous physical activity during the day. The differences between mild anxiety group with no and moderate-to-severe anxiety groups were overall less apparent.

Conclusion: Findings suggest that severity of depression and anxiety are manifested in physical and physiological metrics generated by a consumer-grade wearable ring. Although consumer wearables cannot yet replace gold-standard clinical methods, these findings suggest that they may be a promising tool for large-scale monitoring and early detection of mental health risks.

SO.2.15-04

Alleviating Barriers: Community Physical Activity for People with Severe Mental Illness. Co-SPACES

G. Jones¹, E. Bowes², T. Burke³, M. Faires⁴, K. Machaczek⁵, H. Quirk⁶, E. Peckham³

¹Sheffield Hallam University, School of Sport and Physical Activity, Sheffield, United Kingdom, ²University of Leeds, School of Medicine, Leeds, United Kingdom, ³Bangor University, Centre for Mental Health and Society, Bangor, United Kingdom, ⁴York St John University, Institute for Health and Care Improvement, York, United Kingdom, ⁵Sheffield Hallam University, Advanced Wellbeing Research Centre, Sheffield, United Kingdom, ⁶University of Sheffield, School of Medicine and Population Health, Sheffield, United Kingdom

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Co-SPACES aimed to understand how community physical activity (PA) providers and NHS trusts could connect to support those with severe mental illness (SMI) live physically active lives. Co-SPACES is an extension of 'SPACES', a PA intervention delivered within NHS mental health services to those with SMI. People with SMI experience a mortality gap of 10–20 years compared with those without SMI, which is largely attributable to physical health conditions and modifiable lifestyle behaviours, including physical (in)activity. Community PA providers offer sustainable opportunities for those with SMI, however experience barriers that prevent widespread support.

Methods: Co-production workshops were held to design and develop relevant resources that would tackle community PA providers barriers to engaging those with SMI in community-based PA opportunities, and NHS barriers of engaging with community PA providers. Double diamond design approach was the theoretical underpinning. Workshop activities included problem identification and definition, and solution development and refinement. Eighteen people, including those with lived experience of SMI, community PA providers and NHS professionals attended workshops (Sheffield Workshop1: N=7, London Workshop1: N=11, Final Workshop2 (combination of Sheffield and London attendees): N=8) to develop the resources. An online survey was used for final refinement of resources.

Results: Generated outputs included a booklet and a video resource. Resource content that empowers NHS trust and community PA providers to establish links and better support those with SMI to be active in the community are vital to support those with SMI live active lives. Demonstration and understanding of SMI, the needs of those with SMI, and key requirements of a community PA provider (Place, People, Provision) PA session to support those with SMI, were all highlighted as crucial elements of any outputs.

Conclusion: Multi-stakeholder co-production workshops enable unique blended insights to aid problem identification and solving. Resources that emphasised lived experiences of those with SMI being active in the community and the perspectives of those working in community provider organisations were vital components. Developing resources that demonstrated different perspectives, raised SMI awareness, offered helpful guidance on connecting with, and supporting, community providers provision of PA opportunities to those with SMI was significant.

SHORT ORALS

SO.2.15-06

Ownership and Establishment of Local Partnerships for System Change: Exploring Stakeholder Engagement in the Thriving Communities Lab

C.B. Simonsen¹, N. Daugaard¹, H.T. Maindal¹, K. Ryom¹

¹Aarhus University, Department of Public Health, Aarhus, Denmark

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The purpose of this study is to explore how key stakeholders participating in the system orientated Group Model Building (GMB) workshops ascribe meaning to the *Thriving Communities Lab* initiative, which aims to promote youth wellbeing. The study aims to understand stakeholders' sense of ownership, including how they perceive youth involvement within this process, and to identify the factors that facilitate or hinder the establishment of local partnerships. Drawing on theoretical perspectives such as Lachapelle's framework on ownership, the study investigates how ownership is expressed in terms of process, outcome, and distribution, and how these dimensions influence the establishment and sustainability of local partnerships.

Methods: A multi-method design will be applied, combining three complementary data generation strategies: (a) observations of nine GMB workshops (three within each of the selected Intervention Areas; sleep, timely actions and leisure time activities), (b) exit surveys distributed to GMB workshop participants during the workshops, and (c) individual semi-structured interviews with 4–6 key stakeholders from each of the established local partnerships. Two researchers will observe each GMB workshop with distinct analytical foci. One observer is focusing on theoretical perspectives of ownership, while the second observer is using a checklist to assess the presence of co-creation principles during workshops. Questionnaires will capture participants' experiences and engagement in the process. The subsequent semi-structured interviews will further explore stakeholders' reflections on ownership, partnership formation, and collaboration, drawing on insights from the observations and questionnaires. The data will be analyzed thematically to identify cross-cutting themes.

Results: Preliminary analyses are expected to reveal varying degrees of perceived ownership and engagement among the stakeholders. Key factors anticipated to influence local partnership establishment include perceptions of power and authority in decision making, clarity of shared goals, and ongoing support for collaboration. We will present data from one Intervention Area, sleep, at the conference.

Conclusion: This sub-study will provide an in-depth understanding of how ownership and co-creation processes shape the formation and sustainability of local partnerships for system change. Insights will inform strategies for fostering meaningful stakeholder engagement and enhancing collaborative capacity in initiatives aimed at improving youth wellbeing.

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Type 2 diabetes (T2D) represents a growing public health concern worldwide. Beyond classical lifestyle risk factors, psychosocial determinants, such as dispositional mindfulness, have been proposed as potential protective factors. However, no prospective data have been available to date in the general population regarding these associations. The objective of our study is to examine the prospective association between dispositional mindfulness and incident T2D over 9 years in a large French cohort and to investigate the potential mediating roles of BMI, diet

SHORT ORALS

quality, and physical activity.

Methods: A total of 63,336 participants (mean $\pm$ SD age: 48.2 ± 14.6 years; 78.8% women) from the NutriNet-Santé cohort without T2D at baseline were followed between 2013 and 2024. Dispositional mindfulness was assessed in 2013 using the validated French Five Facets Mindfulness Questionnaire (FFMQ). Incident T2D cases were identified through self-reported medical diagnoses, medication use, and linkage with health insurance databases. Sex-stratified cox proportional hazards models were used to estimate hazard ratios (HR) and 95% confidence intervals (CI), adjusting for sociodemographic factors. Mediation analyses explored the indirect effects of diet quality, physical activity and BMI.

Results: During the median follow-up period of 9 years (505,714 person-years), 1,011 incident cases of T2D were identified. Higher levels of dispositional mindfulness were significantly associated with a lower risk of T2D in females (HR = 0.70; 95 % CI: 0.58 – 0.84; $p < 0.001$), while no significant association was found in males (HR = 0.97; 95 % CI: 0.75 – 1.25; $p = 0.800$). In females, diet quality, physical activity and BMI mediated 5.6 %, 11.1 % and 30.7 % of the association, respectively.

Conclusion: Higher dispositional mindfulness was prospectively associated with a lower risk of T2D in females, partly mediated by diet quality, physical activity and BMI. These findings support the potential value of mindfulness, as a modifiable psychological factor, in complementing traditional diabetes prevention strategies. Further research is warranted to confirm these associations and clarify underlying mechanisms.

SO.2.15-08

Effect of a Multi-level Physical Activity, Nutrition, and Social Needs Referral Intervention on Stress Levels in a Low-income Community on the U.S-Mexico Border

B. Reininger¹, L. Mitchell-Bennett¹, S. Lee², M. Lee³, N. Heredia⁴, M. Zolezzi¹, J. Lopez¹, J. Conroy⁵, P. Sanchez¹

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Tu Salud ¡Sí Cuenta! (TSSC) is a multilevel community intervention that promotes physical activity and healthy eating among Hispanic populations in South Texas. For nearly two decades, TSSC has shown success in increasing physical activity and fruit and vegetable intake through multilevel strategies implemented by Community Health Workers. We examined the longitudinal effects of an enhanced TSSC intervention (adding alcohol behavior content and screening and referrals for social determinants of health needs such as food insecurity and transportation) as part of a randomized control trial assessing changes in nutrition and physical activity, as well as perceived stress levels (focus of this study).

Methods: A total of 500 participants from 10 communities were randomized to receive either the original or enhanced TSSC intervention. Participants completed surveys at baseline, 6 months, and 9 months to assess perceived stress (high vs. low), demographic characteristics, and health behaviors. Longitudinal logistic regression models using generalized estimating equations evaluated the effects of intervention group, time, and their interaction on stress levels, controlling age, gender, insurance status, and preferred language.

Results: Participants had a mean age of 52.1 years (SD = 16.2), with 13.6% male and 60.2% insured. Over time, both groups showed decreased stress levels, with greater reductions observed in the enhanced group. From baseline to 6 months, the enhanced group's stress odds decreased (aOR = 0.77, 95% CI: 0.56–1.04, $p = 0.09$) compared to the original group (aOR = 0.88, 95% CI: 0.65–1.20, $p = 0.42$). This pattern continued through 9 months, with the enhanced group showing further decline (aOR = 0.76, 95% CI: 0.55–1.04, $p = 0.08$) and the original group showing minimal change (OR = 0.98, 95% CI: 0.69–1.40, $p = 0.92$). The overall group-by-time interaction was statistically significant ($p = 0.0177$).

Conclusion: The enhanced TSSC intervention showed significantly greater reductions in perceived stress over time compared to the original group. These findings suggest combining physical activity, nutrition, and social determinants of health interventions, reduced perceived stress among participants.

Testing Self-compassion as an Exercise Intervention Adjunct for Students with Depression: A Feasibility and Preliminary Effectiveness Study

S.J. Adler¹, C. Adams², E. Pila¹

¹Western University, School of Kinesiology, London, Canada, ²Western University, Medical Sciences, London, Canada

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: With up to 70% of university students reporting depressive symptoms that make it difficult to function academically, campus mental health services are often unable to keep up with the demand. This dilemma warrants the exploration of accessible, campus-based mental health supports that leverage the proximal peer community. Thus, the purpose of the present investigation was to examine the feasibility, acceptability, and effectiveness of a peer-led group exercise program for university students with depression. Importantly, we sought to examine if adding self-compassion psychoeducation would confer similar benefit to empirically-supported approaches combining exercise and behavioral counselling. Previous research indicates supplemental psychological supports lead to greater improvements in mental health compared to exercise only, yet current behavioral coaching approaches neglect emotion-focused strategies (i.e., self-compassion) that target affective dysregulation, a key barrier to physical activity in individuals with depression.

Methods: Undergraduate students with a confirmed diagnosis of major depressive disorder ($M_{age} = 21.6 \pm 3.2$) were randomized to three groups: 1) exercise only ($n=14$), 2) exercise + behavioral counselling ($n=21$), and 3) exercise + self-compassion ($n=15$). Led by trained kinesiology students, the 10-week intervention involved 30 virtual group sessions consisting of aerobic and strength training activities. Measures included feasibility and acceptability metrics, and assessments of depression and physical activity at baseline, immediately post-intervention, and three months post-intervention.

Results: The intervention demonstrated feasibility and acceptability with adequate average session adherence rates (70%) and overwhelmingly positive qualitative responses, with over 80% of participants expressing eagerness to participate again. Between-group comparisons from baseline to three-month follow-up revealed the self-compassion group had moderate improvements in depression ($d = -0.58$) and physical activity participation ($d = 0.40$) compared to the exercise only group. And, the self-compassion group demonstrated superior sustained physical activity engagement at follow-up, compared to the behavioral counselling group ($d = 0.48$).

Conclusion: This pilot, randomized control trial study provides preliminary support for the feasibility, acceptability, and effectiveness of an exercise program that incorporates education on self-compassion. Self-compassion skills were evidenced to produce similar and even additional benefits to students' physical activity engagement. Considering resource-intensiveness, this study provides parameter estimates to inform a more robust trial, indicating promising new approaches to campus-based mental health supports.

SO.2.15-10

Food and Mood Study – Exploring the Determinants of Dietary Behaviours That Support Wellbeing in Young Adults with Symptoms of Depression and Anxiety

G. Smith¹, R. Roy^{1,2,3}, R. Slykerman⁴, N. Gillies¹

¹University of Auckland, Nutrition and Dietetics, Faculty of Medical and Health Sciences, Auckland, New Zealand,

²University of Sydney, Nutrition and Dietetics, Sydney, Australia, ³University of Sydney, Charles Perkins Centre, Sydney, Australia, ⁴University of Auckland, Psychological Medicine, Faculty of Medical and Health Sciences, Auckland, New Zealand

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Poor mental health in young adults is a major societal issue. There is growing evidence for the link between diet quality and mental health. However, the holistic and complex determinants of dietary behaviours for wellbeing in young adults with poor mental health has largely been neglected, limiting the development of practical solutions.

SHORT ORALS

Methods: A 48-item mixed-methods survey informed by the COM-B (capability, opportunity, motivation and behaviour) model was developed. Young adults (18-30y) in New Zealand experiencing at least mild symptoms of anxiety and/or depression (screened with the DASS-21) took part in an online survey. Likert scale questions were descriptively analysed, and used to construct scaled COM domain scores ranging from 0-10. Open-ended questions were analysed through inductive thematic analysis.

Results: Participants (n=154, 23±4 years) were predominantly female (84%), NZ European (76%), and well educated (58% with a university degree). Participants demonstrated a high level of capability (domain score = 7.1±1.5). Most participants (79%) were aware of the link between diet quality and mental health, and qualitative data demonstrated a deep and holistic understanding. Three-quarters reported feeling capable of choosing foods or preparing meals that support wellbeing, yet only 35% agreed that they can do so during periods of worsened mental health. Opportunity domain scores were lower (6.5±1.1), with apparent barriers including price (85% agreed it is expensive to purchase healthy foods) and access (50% reported being easily able to access healthy foods). Many participants reported that eating with others impacts their food choices (73%) or eating experience (77%), yet qualitative responses diverged as to whether this is positive or adds additional stress. Almost all participants indicated that it is important to eat a diet that supports wellbeing, yet only half reported feeling motivated to make food choices that support wellbeing, indicating an attitude-motivation gap.

Conclusion: Young adults with symptoms of anxiety and/or depression demonstrate a high level of capability regarding dietary behaviours that support wellbeing, yet there is a disconnect with actual behaviours which is exacerbated by worsened mental health. Dietary interventions spanning across individual motivational barriers, and food and social environments are all required to improve young adults' mental health.

SO.2.15-11

Moving More in Early Intervention Services: Move

G. Jones¹, E. Peckham², M. Faires³, T. Burke²

¹Sheffield Hallam University, School of Sport and Physical Activity, Sheffield, United Kingdom, ²Bangor University, Centre for Mental Health and Society, Bangor, United Kingdom, ³York St John University, Institute for Health and Care Improvement, York, United Kingdom

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: People with severe mental illness (SMI) experience a mortality gap of 10-20 years compared with people without SMI. A major contributing factor is preventable physical health conditions such as diabetes and cardiovascular disease. Physical activity (PA) is a leading risk factor for physical health conditions, and thus a priority.

Psychosis typically develops in adolescents and young adults. Early Intervention Services (EIS) support those with at risk mental state (ARMS) and first episode of psychosis (FEP) for up to three years. EIS' support long-term health outcomes including symptom reduction and functional outcomes, and includes treatments such as antipsychotic medication, cognitive behavioural therapy, vocation, education, case worker social and rehabilitation support, and peer and community engagement. PA lifestyle interventions are not routinely offered in EIS, however early evidence suggest PA intervention benefits include improved sleep, wellbeing, psychological functioning and verbal short-term memory.

Methods: A series of patient, public involvement and engagement (PPIE) workshops with lived experience people in EIS will be run to unearth broad themes around an EIS integrated PA intervention, including important determining factors. PPIE sessions will also be run with NHS professionals to understand the possibility of an integrated PA intervention in EIS care.

Results: PPIE workshops will take place between November 2025 and March 2026. A full write up of PPIE workshop findings will be written up by April 2026. Possible themes include, motivation, barriers, enablers, and key intervention functions are likely to be presented.

Conclusion: Despite early research demonstrating the positive impact PA can have on those in EIS, there is limited investigation on the motives, barriers, enablers and intervention functions of PA intervention in EIS. Findings will benefit the academic community on general understanding from both lived experience and NHS professionals on early design, motivation, and potential integration of PA intervention in routine EIS'.

SO.2.15-12

Symptom Burden in Multiple Sclerosis and its Relationship with Physical Activity Level

B. Bailey¹, C.-C. Lin¹, Q. Bao¹, S. Brown¹, D. Kinnett-Hopkins¹

¹University of Michigan, School of Kinesiology, Ann Arbor, United States

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Multiple sclerosis (MS) is a chronic neurological disease characterized by symptoms of fatigue, pain, reduced physical function, anxiety, depression, and sleep disturbance, which can negatively impact daily function and quality of life. Physical activity is a promising modifiable behavior that can alleviate these symptoms. This study compared patient-reported outcomes between people with MS (PwMS) and non-MS matched controls, stratified by physical activity level. Identifying symptoms most associated with physical activity may help inform targeted physical activity interventions to improve symptom management in PwMS.

Methods: In this cross-sectional study, adults with MS were matched 1:1 with non-MS participants by sex and age. Patient-reported outcomes included the PROMIS Fatigue, Pain Interference, Physical Function, Anxiety, Depression, and Sleep Disturbance scales, along with the Fatigue Severity Scale (FSS) and the Visual Analog Scale (VAS) for pain assessment. Participants were categorized as active or insufficiently active according to the Godin Leisure-Time Exercise Questionnaire Health Contribution Score. Independent t-tests compared PwMS and controls within each activity group, and Group×Activity interactions were tested using linear models to examine whether physical activity moderated between-group differences.

Results: The study included 24 PwMS and 24 matched non-MS controls (mean age: 51.3±11.0 years; 80% females; disease duration: 13.6±9.8 years). Most PwMS were insufficiently active (75%) compared with 30% of non-MS controls. Among insufficiently active participants, PwMS reported significantly greater fatigue (PROMIS Fatigue, $p=0.003$; FSS, $p=0.004$), pain (PROMIS Pain, $p=0.045$; VAS Pain, $p=0.008$), anxiety ($p=0.006$), depression ($p=0.007$), and reduced physical function ($p=0.002$) than non-MS. In the active groups, overall symptom levels were lower, and between-group differences were less pronounced. The Group×Activity interaction was not statistically significant; however, smaller differences in fatigue and pain were observed among active participants.

Conclusion: Symptom burden was higher in PwMS, particularly among those who were insufficiently active. Although the interaction was not statistically significant, the observed trend toward smaller differences in pain and fatigue among active participants suggests that these symptoms may be important targets for physical activity interventions. Larger studies are warranted to confirm these trends.

SO.2.15-13

Comparative Effects of Exercise and Mindfulness Therapies on Depression and Anxiety in Individuals with Chronic Primary Low Back Pain. The BACKFIT Project

G. Tsiarleston^{1,2,3}, V. Segura-Jiménez^{1,2,4}

¹Instituto de Investigación Biosanitaria ibs.GRANADA, Granada, Spain, ²UGC Medicina Física y Rehabilitación, Hospital Universitario Virgen de las Nieves of Granada, Granada, Spain, ³Physical Activity for Health Promotion (PA-HELP) Research Group, Department of Physical Education and Sports, Faculty of Sport Sciences, University of Granada, Granada, Spain, ⁴GALENO Research Group, Department of Physical Education, Faculty of Education Sciences, University of Cádiz, Cádiz, Spain

SO.2.15 Mental Health and Wellbeing: Mind, Body, and Technology: Emerging Strategies in Mental Health Care
Room 6, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The prevalence of depression and anxiety among individuals with chronic primary low back pain (CPLBP) is around 50%, and these conditions usually occur simultaneously. The aim of this study was to compare the effects of exercise and a multimodal approach (exercise + mindfulness) with those of a usual rehabilitation care group on depression and anxiety in individuals with CPLBP.

Methods: Of 105 randomized participants, 50 individuals with CPLBP (aged 53 ± 10 years) who attended more than

SHORT ORALS

65% of the program were analyzed: control group (CG, $n=16$), exercise group (EG, $n=14$), and exercise + mindfulness group (EMG, $n=20$). All groups completed an 8-week intervention twice weekly (45 minutes/session). The CG received usual care (stretching and motor control exercises). The EG and EMG performed muscle-strengthening exercises mainly. Additionally, the EMG attended a weekly mindfulness session (2.5 hours/session). Depression and anxiety were assessed using the Beck Depression Inventory-II and the State-Trait Anxiety Inventory. Assessments were performed pre- and post-intervention and after a 2-month detraining period.

Results: Repeated-measures analyses (Wilcoxon test) showed that CG (median (Me) = 8.5; interquartile range (Q1–Q3) = 1.5, 18.25; $p = 0.013$), EG (Me = 6.00; Q1–Q3 = 3.5, 11.5; $p = 0.002$), and EMG (Me = 9.5; Q1–Q3 = 4.25, 12.75; $p = 0.006$) reduced depression after the intervention. CG (Me = 19.50; Q1–Q3 = 9.00, 35.00; $p = 0.026$) and EG (Me = 17.50; Q1–Q3 = 11.25, 25.75; $p = 0.030$) also reduced anxiety after the intervention. After the detraining period, EG maintained the improvements in depression (Me = 15.50; Q1–Q3 = 3.75, 18.50; $p = 0.026$) and anxiety (Me = 16.00; Q1–Q3 = 10.50, 32.25; $p = 0.003$), whereas no significant differences were found in CG or EMG (all $p > 0.05$). The Kruskal-Wallis test showed non-significant post-pre or re-pre differences between groups (all $p > 0.05$).

Conclusion: The interventions significantly reduced depression scores across all groups, although no inter-group differences were detected. While anxiety was reduced post-intervention in the exercise and control groups, no differences between-groups were detected. Only the exercise group sustained these improvements during the detraining period.

SO.2.16-01

Inequalities and Intersectionality in Post-pandemic Food Insecurity in Southern Brazil

R. Garcia Neves¹, T. Ramos Flores², S. Manjourany Silva Duro¹, M. Oliveira Saes³

¹Federal University of Pelotas, Pelotas, Brazil, ²University of Illinois, Champaign, United States, ³Federal University of Rio Grande, Rio Grande, Brazil

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Food insecurity is a public health problem in the country, and it has been intensified due to the pandemic. Brazil is a country characterized by significant sociodemographic inequalities. This study aims to assess the inequalities and intersectionality of sociodemographic factors related to food insecurity among adults and the elderly in southern Brazil.

Methods: This cross-sectional study was conducted in 2022-2023 among adults aged 18 and over in Southern Brazil. The outcome was food insecurity, assessed using the short version of the Brazilian Food Insecurity Scale. The participants were classified as experiencing food insecurity if they answered affirmatively to at least one of the five questions. The exposures to build the intersectionality variable, called the Jeopardy Index, were sex, self-reported skin color, and completed years of education. Within the intersectionality framework, a score of 0 indicates the least inequity (male, Caucasian, and a high level of education). In contrast, a score of 4 refers to the most significant degree of inequity (female, Black/Brown/Yellow, and Indigenous people with a low level of education). Poisson regression was used to calculate the prevalence ratio (PR) and its 95% confidence interval (95% CI).

Results: Of the 1,918 individuals interviewed during follow-up, the prevalence of food insecurity was 34.1% (95%CI 32.0; 36.3). After the adjustments, it was observed that females had a 1.68-fold higher prevalence of food insecurity than males, and participants with 0 to 8 years of schooling had a food insecurity prevalence ratio 1.70-fold higher than those with ≥ 12 years of schooling. No statistically significant differences in FI were observed according to skin color. According to the jeopardy index, women, Black/Mixed/Asian, and Indigenous people with low levels of education were approximately three times more likely to experience food insecurity than males, White participants, and those with high levels of education [PR = 3.05 (95%CI 1.88; 4.95)].

Conclusion: Inequalities were evident in the characteristics analyzed separately, in addition to an interaction between them that produced a cumulative risk of food insecurity in the most vulnerable groups, such as women, those of black/brown/yellow or indigenous skin color, and individuals with low socioeconomic status.

Psychosocial and Individual Determinants of Beverage-related Behaviors in Children: Findings from the DRINK Trial (Belgium, 2021-2022)

L. Desbouys¹, W. Assakali¹, I. Thiébaud², M. Rouche¹, K. Castetbon¹

¹Université Libre de Bruxelles, School of Public Health, Brussels, Belgium, ²Club Européen des Diététiciens de l'Enfance (CEDE), Ath, Belgium

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Children's beverage consumption behaviors are shaped by a combination of individual characteristics and broader socioeconomic and family environments. These influences have rarely been examined jointly within a multidimensional study framework. This study aimed to investigate the associations of demographic and psychosocial determinants with several children's beverage-related behaviors.

Methods: Data were drawn from the inclusion phase of the cluster randomized DRINK trial, conducted in 46 Belgian French-speaking primary schools. A total of 3,139 children aged 8-11 years completed a self-administered questionnaire in class. Logistic regression modelling was used for the following binary outcomes, derived from multiple-item questions or scores: susceptibility to food marketing (0: $\leq$ P75 vs. 1: $>$ P75), peer influence toward beverage consumption (0: $\leq$ median vs. 1: $>$ median), perceived parental permissiveness regarding beverage consumption (0: low to medium vs. 1: high), and liking for sugar (0: $\leq$ P75 vs. 1: $>$ P75). Key independent variables included age, sex, family affluence, country of birth, living with both parents, self-efficacy, self-rated health, and life satisfaction. Multilevel modelling was used to account for clustering at the school level.

Results: Children aged 7-8 years (aOR: 1.60 [1.14-2.23]; ref: 11-13 years), those from low-affluence families (aOR: 1.78 [1.28-2.46]; ref: high affluence), with self-efficacy above the median (aOR: 1.42 [1.17-1.71]; ref: below median), and those perceiving their health negatively (aOR: 1.53 [1.19-1.97]; ref: positive perception) were more likely to be in the highest quartile of susceptibility to marketing. Boys (aOR: 1.26 [1.08-1.47]), children from low-affluence families (aOR: 1.46 [1.11-1.92]), and those with self-efficacy above the median (aOR: 1.19 [1.02-1.40]) were more likely to be in the half most influenced by peers. Parental permissiveness was associated with age, family affluence, self-rated health and country of birth, while sugar-liking was associated with sex and self-efficacy. School-level effects were limited but statistically significant across models.

Conclusion: Younger age, negative self-perceptions and socioeconomic disadvantage appear to be linked with increased vulnerability to beverage-related behaviors. These findings underscore the complex interplay between social environment and individual factors in shaping such behaviors among children. They will inform the interpretation of the DRINK trial outputs.

Food Insecurity and Adolescent Mental Health in Belgium and Ireland: Evidence from the 2021/22 HBSC Survey Using Multiple Mental Health Indicators

M. Rouche^{1,2}, C. Kelly³, Y. Bahbah^{1,2}, A. Gavin³, E. Holmberg^{1,2}, C. Mertens^{1,2}, K. Castetbon^{1,2}

¹Université Libre de Bruxelles, Service d'Information, Promotion, Éducation Santé (Sipes-ULB), School of Public Health, Brussels, Belgium, ²Université Libre de Bruxelles, Research Center in Epidemiology, Biostatistics and Clinical Research, School of Public Health, Brussels, Belgium, ³University of Galway, Health Promotion Research Centre, School of Health Sciences, Galway, Ireland

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Food insecurity (FI) is often assumed to be non-existent in high-income countries and therefore, is infrequently assessed. Yet it may have short- and long-term detrimental effects on mental health. This study compared mental health outcomes among food-insecure adolescents and their food-secure counterparts in Belgium and Ireland, two

SHORT ORALS

high-income countries with distinct contexts, using indicators ranging from reduced wellbeing to clinical conditions.

Methods: Data came from the standardised Health Behaviour in School-aged Children (HBSC) survey conducted in 2021/22 in French-speaking Belgium and Ireland. Among randomly selected schools and eligible participants, 10,387 (Belgium) and 6,155 (Ireland) adolescents aged 10-17 years were finally included in analyses. FI was assessed using the USDA nine-item module and classified as food secure (≤ 1 point) or food insecure (2-9 points). Mental health outcomes included self-rated health (4-answer question), life satisfaction (Cantrill ladder), loneliness (5-answer question), and wellbeing (WHO-5). Weighted logistic regressions were conducted separately by country to examine associations between FI and these outcomes, adjusting for sex, age, Family Affluence Scale (FAS), and family structure. Interactions with FAS were tested and additional stratified analyses were performed.

Results: In 2021/22, 15.7% [95%CI: 14.4-17.1] and 12.0% [11.3-13.0] of adolescents were food insecure in Belgium and Ireland, respectively. FI prevalence was similar across sexes (e.g.: 16.3% boys and 15.2% girls in Belgium) but significantly increased with age in Ireland and decreased with higher FAS levels in both countries (from 27.8% to 5.2% in Belgium; from 20.0% to 7.4% in Ireland). In both countries, FI was consistently associated with poorer outcomes across all mental health indicators. Indeed, adolescents experiencing FI were more likely to report low life satisfaction (Belgium: 2.70 [2.27-3.20]; Ireland: 2.63 [2.11-3.28]) and loneliness (Belgium: 2.18 [1.85-2.58]; Ireland: 2.73 [2.23-3.35]). Across all FAS categories, FI remained associated with adverse mental health outcomes, except for depression risk among those with high FAS (Belgium: 0.83 [0.36-1.87]; Ireland: 1.43 [0.69-2.96]).

Conclusion: As this study was cross-sectional, causal relationships cannot be inferred. Nonetheless, the consistent associations observed across multiple mental health indicators highlight the need for monitoring and targeted interventions addressing FI and its potential mental health consequences among adolescents.

SO.2.16-04

Mapping Structural Inequities: Deprivation and Breastfeeding Outcomes across California

A. Chaney¹, C. Arnold¹, L. Nommsen-Rivers¹, J. Falbe², B. Chambers Butcher², L.A. Simmons³, L. Au¹

¹University of California, Davis, Department of Nutrition, Davis, United States, ²University of California, Davis, Department of Human Ecology, Davis, United States, ³University of California, Davis Health, Sacramento, United States

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: In the United States, persistent breastfeeding disparities reflect underlying structural and socioeconomic inequities. Understanding how regional deprivation contributes to these differences can inform public health planning and resource allocation. This study developed a measure of regional deprivation across California and examined its association with breastfeeding outcomes during the first three months of life.

Methods: Socioeconomic characteristics by California county (local administrative regions comparable to districts or provinces) were obtained from the 2021 Census Bureau American Community Survey 5-year estimates. Principal Component Analysis (PCA) identified indicators that accounted for the most variance across counties to construct the deprivation index. Final deprivation scores were standardized to have a mean of 0 and a standard deviation of 1, with higher scores representing more deprived areas. In-hospital breastfeeding initiation was collected during the California Newborn Screening program within 24-48 hours of birth. Any breastfeeding and exclusive breastfeeding at 3 months were collected through the California Maternal and Infant Health Assessment statewide survey and available for 35 of 58 counties with sufficient birth sample sizes. Meta-regression analyses incorporating county-level estimates and confidence intervals were used to examine the association between county deprivation and in-hospital initiation, any breastfeeding, and exclusive breastfeeding at 3 months.

Results: The first principal component, which accounted for 73% of the variance, was used to construct the final county deprivation index, including the variables: home value, males in professional occupations, households in poverty, households earning under \$45,000, and population unemployed. California county deprivation scores ranged from -2.17 (least deprived) to 2.15 (most deprived). Despite high in-hospital breastfeeding initiation ($94 \pm 3\%$), rates declined at 3 months for any breastfeeding ($72 \pm 9\%$) and exclusive breastfeeding ($35 \pm 9\%$). County deprivation was not associated with in-hospital breastfeeding initiation ($p=0.630$), but was associated with any ($\beta = -0.077$, $SE=0.007$; $p<0.001$), and exclusive ($\beta = -0.047$, $SE=0.010$; $p<0.001$) breastfeeding at 3 months, corresponding to a 4.7 and 7.7 percentage-point decrease per 1 SD higher deprivation.

Conclusion: County deprivation across California was associated with lower rates of breastfeeding continuation,

SHORT ORALS

but not initiation. Advancing breastfeeding equity will require coordinated policies and programs that tackle the structural and community-level inequities shaping infant feeding practices.

SO.2.16-05

Addressing Food Insecurity and Diet Quality in Low Income Pregnant Populations Using a Systems Alignment Approach

E. Borawski¹, A. Glenn², C. Mundorf³, S. Bentley¹, J. Sanchez², G. Malz¹, J. Lever³, N. Larberg³

¹Case Western Reserve University, Nutrition, Prevention Research Center for Healthy Neighborhoods, Cleveland, United States, ²Greater Cleveland Food Bank, Cleveland, United States, ³Better Health Partnership, Cleveland, United States

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Nourishing Beginnings is an integrated service delivery model that supports low-income, pregnant individuals in accessing nutritional food during pregnancy, facilitated by a community health worker. In this pilot study, participants were randomly assigned to two alternatives to healthy food access throughout their pregnancy and up to six months postpartum. The goal was to determine program feasibility and to examine the impact on birth outcomes (gestational age, birthweight, complications, NICU stay) as well as proximal maternal outcomes of prenatal care, diet quality, and psychosocial factors (depression, stress, social support, cooking attitudes).

Methods: We enrolled and randomized 160 pregnant individuals (>18, less than 22 weeks pregnant; 80 per arm) to receive either bi-weekly, home-delivered, medically tailored groceries (MTG) curated by registered dietitians and delivered by the local food bank, or bi-weekly cash assistance (CASH) with healthy food access navigation. Key data was collected at baseline, near delivery (36-38 weeks gestation), and three months postpartum, each of which included a survey, two 24-hour food recalls and clinical data. Intervention groups are compared to each other and a concurrent matched sample from Medicaid data.

Results: When compared to the CASH group, the MTG group reported a significant reduction in food insecurity ($p<0.05$); however, both groups reported similar improvements in stress, depression, and social support. MTG babies were less likely to be preterm (<37 weeks; 15.3% vs. 19.0%), low birthweight (<2500 gms; 16.4% vs. 19%), or admitted to the NICU (14.4 vs. 19.4%) than CASH group babies, however, these differences were not statistically significant - both sample size and lack of a pure control group, likely contributing. When comparing to matched Medicaid controls, the CASH group, but not the MTG group, was different from the controls on birthweight and gestational age (negative findings).

Conclusion: As one of the first randomized trials of MTGs with low-income pregnant individuals, our pilot confirmed the directionality of intervention impact, confirmed feasibility and study retention, and provided valuable lessons learned that are now being applied to a newly NIH funded RCT that will compare the home delivered MTG approach with a hospital-based MTG program and one with a supplemental training and education component.

SO.2.16-06

Affordability of Healthy Food Baskets and Access to Food Assistance Programs in Subnational Regions of Uruguay, a High-income Latin American Country

G. Brunet¹, G. Ares¹

¹Universidad de la República, Montevideo, Uruguay

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Monitoring economic access to healthy foods is key to developing policies to achieve food security and the right to food. In this context, the present study aimed to analyze households' affordability of a Healthy Food Basket (HFB) and access to food assistance programs in subnational regions of Uruguay, a high-income Latin American country.

SHORT ORALS

Methods: The database from the National Survey on Household Expenditure and Income (2016-2017) was used (n=6889). Baskets were constructed for two regions: the capital city Montevideo; the rest of the country. They were based on linear programming for a representative individual of each region, considering their nutritional needs and dietary patterns, and were composed of unprocessed, minimally processed and processed foods and beverages. Rates of non-affordability and participation in State-provided cash and in-kind transfers, and average benefit amounts were calculated for deciles of household disposable income. Welch's ANOVA and Pearson's Chi-square tests were conducted to analyze mean and proportion differences, respectively. A significance level of 5% was used. Analyses were performed using R software.

Results: The costs of the HFB in May 2017 were 4.4 dollars for Montevideo and 4.1 dollars for the rest of the country (international dollars per person per day). Approximately 37% of the households presented non-affordability, i.e., lower food expenditure compared to the cost of the HFB. Households from Montevideo presented a lower rate of non-affordability ($p<0.001$). More than 50% of the households of income deciles 1 and 2 had food expenditures lower than the cost of the basket, whereas among deciles 9 and 10 the non-affordability rates were lower than 20% ($p<0.001$). Households of lower income had higher participation rates in State-provided programs aimed at increasing food access and received higher benefits. However, benefits represented, on average, less than 10% of the HFB cost in low-income households.

Conclusion: A relevant share of the Uruguayan population faces economic barriers to accessing healthy foods, underscoring important limitations to the exercise of the right to food and the achievement of minimum levels of well-being. Results provide input for developing policies to increase the coverage and benefits of cash and in-kind transfers for the most deprived households.

SO.2.16-07

Navigating Complementary Feeding in Food Insecure Households: Experiences of New Zealand Mothers

I. Katiforis^{1,2}, C. Smith², A.-L. Heath², L. Te Morenga³, S. Styles²

¹Deakin University, School of Exercise and Nutrition Sciences, Burwood, Australia, ²University of Otago, Department of Human Nutrition, Dunedin, New Zealand, ³Massey University, Research Centre for Hauora and Health, Wellington, New Zealand

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Household food insecurity, defined as a limited or uncertain availability of nutritionally adequate and safe foods or limited ability to acquire acceptable foods in a socially acceptable way, is an important public health issue affecting one in four families with infants in New Zealand. Household food insecurity disproportionately impacts mothers and may compromise infant nutrition due to mothers' central role in feeding. This study explored mothers' feeding behaviours and experiences of introducing complementary foods to their infants in food insecure households, addressing a research gap that has largely focused on breastfeeding in this context.

Methods: In 2022, in-depth semi-structured interviews were conducted in person with 15 mothers from the First Foods New Zealand study (2020-2022) in Dunedin, New Zealand. Mothers experienced moderate or severe household food insecurity when their infants were 7-10 months old. Interviews focused on mothers' infant feeding experiences and particularly complementary feeding. Audio recordings were transcribed verbatim, and transcripts were analysed using a reflexive thematic analysis approach.

Results: Three themes, including one subtheme, were generated from the interviews: (1) food purchasing strategies were used to stretch money; (2) the infant's nutrition was prioritised (subtheme: breast milk was perceived to support the infant's nutrition); and (3) support was appreciated, but seeking money or food often brought a sense of shame and disempowerment.

Conclusion: Mothers demonstrated remarkable determination and resourcefulness in feeding their infants nutritiously by stretching limited resources, compromising their own diets, and seeking support despite significant challenges. Their experiences reflect the extensive labour and emotional and cognitive strain involved in food provision in the context of household food insecurity. These findings highlight that educational interventions aimed at improving knowledge of food acquisition are unlikely to address the challenges faced by mothers experiencing food insecurity. Greater financial support is needed to ensure that mothers can consistently provide adequate and nutritious food for themselves and their families.

SHORT ORALS

SO.2.16-08

Are Enslaved Black Adolescents from the Amazon Region in Brazil Losing their Food Culture? A Mediation Analysis between Food Insecurity and Dietary Patterns

A.L. Honda Figueiredo¹, A.C. Barco Leme²

¹Centro Universitário São Camilo, Nutrition, São Paulo, Brazil, ²University of São Paulo, Nutrition, São Paulo, Brazil

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Racial/ethnic vulnerable groups in Brazil, including *Quilombolas* adolescents, descendent of enslaved blacks formed during the colonial period, have the highest prevalence for food insecurity (FI). Many quilombolas reside in rural and/or remote areas in the Amazon region, but their traditional cultural food practices may be eroded in the current food systems. The study examined socio-demographic aspects of quilombolas adolescents that mediate FI and dietary patterns.

Methods: Three hundred full-time high school students ($M_{age} = 14.09 \pm 2.68$, 55.15% female) completed a self-reported eating behaviour questionnaire with 9 food items and 5 items related to the meal occasions. The eating behaviour questionnaire was used to compute the dietary diversity scores. Parents completed the Brazilian Food Security Scale. Weight and height were self-reported. Parents and adolescents completed a socio-demographic questionnaire. Descriptive statistics and path analysis were performed.

Results: Large proportion of the adolescents' experience FI (83.39%). The mean dietary score was 8.61/14 (95% CI 8.38; 8.83) and as increase severity of food insecurity lower is the dietary score. Approximately 45% of the top 3 food consumed by food secure adolescents were represented by starchy roots (18.97%), fruits (13.36%) and beans (12.93%); while severe food insecure participants were salty snacks (14.48%), starchy roots (13.79%) and processed meats, sugar sweetened beverages and sweets/candies ranked the top 3 (11.72%). Adolescents who consumed snacks and lunch had respectively 40% (OR = 0.61; 95%CI 0.44; 0.84) and 60% (OR: 0.39; 95%CI 0.20; 0.76) to be FS. Adolescents weight status had a negative direct effect on dietary scores ($\beta = -0.32$; SE 0.13) and food insecurity status (-0.61 ; SE 0.24); while race had negative direct effect on food insecurity status ($\beta = -2.12$; SE 0.87). Parents' receiving some governmental benefits had a negative direct effect on food security status ($\beta = -1.62$; SE 0.60).

Conclusion: Study revealed a higher prevalence of food insecurity in quilombolas from the Amazon region, and many of them are losing the cultural food tradition. Many socio-demographic characteristics mediated the association between FI and diet diversity. It is important that governmental programmes would favour ethnically diverse adolescents to encourage their cultural-tradition food practices to attenuate the impact of FI.

SO.2.16-09

Food Purchasing and Consumption in Families at Risk of Poverty: Links to Health and Household Economic Factors

G. Hummel¹, N. Stroebele-Benschop¹, A. Simmet¹

¹University of Hohenheim, Department of Applied Nutritional Psychology, Stuttgart, Germany

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: The aim of this study, which was conducted as part of the larger MEGA_kids project, was to gain a deeper understanding of the nutritional situation and health characteristics among individuals living with children at risk of poverty in Germany using grocery receipts as an objective measure for food purchase patterns.

Methods: Participants were instructed to collect all grocery receipts for a two-week period. Data were aggregated based on food categories. Mean prices adjusted for household size were calculated for each food category. The relationships between grocery expenses, socio-demographics, health characteristics, frequency of family meals, food insecurity status and nutrition knowledge were investigated.

Results: A total of 308 households provided grocery receipts. On average, households spent 118.95 € on food over the

SHORT ORALS

2-week period. Adjusted for household size, the largest share of expenditures was allocated to sweet and salty snack foods (19%), followed by meat and sausages (18%). Milk and dairy products accounted for 12% of the total purchase value of average purchases, while fruits and vegetables each represented 7%. Several significant associations were found between grocery expenses, dietary preference categories and characteristics such as additional household economics, socio-demographics, health data, and other nutrition-related aspects.

Conclusion: This study enhances the understanding of the realities of life for families at risk of poverty and generates objective data on dietary habits and economic decisions related to health. The findings provide a robust basis for practice, research, and policy, facilitating the development of more targeted and effective interventions to improve the nutritional situation of families at risk of poverty.

SO.2.16-10

Social Inequalities and Food Insecurity during Pregnancy: Findings from the ECAIL Study

T. Jacobsen¹, M. Baietto¹, L. Vanhoutte¹, P. Sauvegrain^{2,1}, S. Lioret¹

¹Université Paris Cité and Université Sorbonne Paris Nord, Inserm, INRAE, Centre for Research in Epidemiology and Statistics (CRESS), Paris, France, ²Sorbonne Université, University Midwifery Department, Paris, France

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Food insecurity is a growing public health concern linked to increased obesity risk. In France, these disparities are pronounced in the Hauts-de-France region, which has the highest rates of obesity, poverty, and unemployment nationwide. Social inequalities in nutrition can emerge during pregnancy, yet socially vulnerable families remain underrepresented in epidemiological research. This study aimed to estimate the prevalence of food insecurity among marginalized pregnant women and examine its associations with socioecological factors.

Methods: The ECAIL trial recruited 607 pregnant women experiencing social vulnerability from two maternity wards in Hauts-de-France. Participants are followed at home by dietitians until their child's second birthday. Those in the intervention arm receive personalized support, including breastfeeding promotion, guidance on nutrition and active lifestyles, and financial incentives to access kitchen utensils and healthy foods at reduced prices. This analysis used baseline data from all participants. Food insecurity during pregnancy was measured using the 10-item Household Food Security Survey Module (HFSSM). Applying a socioecological framework, nested multivariable logistic regression models assessed associations between food insecurity and maternal sociodemographic characteristics, including age, birthplace, household size, cohabitation status, education, employment, and household income.

Results: Nearly one-third (29.5%) of participants experienced moderate or severe food insecurity. Compared with those born in mainland France, participants born in sub-Saharan Africa had significantly higher odds (OR 4.56; 95% CI 2.89–7.26). Participants with secondary education or less were more likely to experience food insecurity than those with post-secondary education (OR 2.05; 1.37–3.11), as were participants who were unemployed during pregnancy compared with those who were employed (OR 1.88; 1.03–3.41). Participants with household incomes below €1500/month had higher odds of food insecurity than those earning €2500/month or more (OR 3.25; 1.70–6.45).

Conclusion: These findings reveal a high prevalence of food insecurity among socially disadvantaged pregnant women, driven by intersecting structural determinants. A socioecological lens highlights how broader systems—migration, education, employment, and income—interact with individual factors to shape nutritional vulnerability. Targeted interventions are needed to address immediate food access and upstream drivers. Future research should explore barriers faced by families of sub-Saharan African origin and co-develop culturally adapted strategies to reduce inequities.

SO.2.16-11

A Cross-sectional Study to Understand Experiences of Severe Food Insecurity and Associations with Nutrition Behaviours among Adolescents in Canada

K.A. Patte¹, M. Gohari¹, S.T. Leatherdale²

¹Brock University, Health Sciences, St. Catharines, Canada, ²University of Waterloo, School of Public Health Sciences, Waterloo, Canada

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Despite widespread concern, there is a lack of contemporary and population-level evidence on food insecurity among adolescents. Understanding associated nutrition behaviours is necessary to inform appropriate interventions. This study aimed to: 1) examine the prevalence of food insecurity among sociodemographic subgroups; 2) explore associations between food insecurity and recommended nutrition behaviours.

Methods: We used cross-sectional survey data from 34,356 secondary school students in Canada that participated in the 2023/2024 COMPASS study. Single items asked students about the number of days in the last week that they: Ate less because their family was running out of money for food (an indicator of severe food insecurity), contributed to meal/food preparation, ate meals at home with family, ate food from restaurants, ate snacks from convenience stores/vending machines, brought home-packed lunches to school, and consumed fruit, vegetables, and water. Descriptive statistics explored food insecurity by sociodemographic subgroups. Poisson regression models examined associations between food insecurity (dichotomized as yes=at least one day, no=0 days) and nutrition behaviours (treated as count), controlling for sociodemographic characteristics and school clustering.

Results: One-tenth of adolescents experienced severe food insecurity, with a higher proportion reported among transgender and gender diverse (20.8%), older, Black (19.4%) and Another ethnicity (15.0%), and immigrant (0-5 years in Canada 12.3%; 6+ years 11.1%) students relative to their cisgender (cis-girls 9.7%, cis-boys 8.4%), younger, White (8.1%) and born in Canada (9.1%) peers. Food insecure students reported having family meals at home and consuming vegetables on a 32% and 29% lower number of days in the past week than food secure students, respectively (family meals: estimated 3.34 days in food insecure students vs. 4.88 days in food secure students; vegetable intake: 4.32 vs. 3.09 days); whereas the expected number of days that food insecure students reported meal preparation was 1.05 times higher than food secure students (2.61 vs. 2.48 days). Results for additional nutrition behaviours (listed in Methods) will be presented.

Conclusion: An alarming proportion of adolescents are eating less due to food insecurity; populations at greatest risk warrant targeted interventions. Nuanced results across nutrition behaviours challenge assumptions and reinforce the importance of avoiding interventions that further stigmatize populations.

SO.2.16-12

Exploring Multi-level Protective Factors Shaping Food Security Status and Skin Carotenoid Levels among U.S. Hispanic/Latino Adults: A Mixed-methods Study

A.C. McClain¹, G. Luna¹, K. Rodriguez¹, C. Lineiro¹, A. Diaz Mendez¹, G.X. Ayala², J. Mattei³, L.C. Gallo⁴

¹San Diego State University, School of Exercise and Nutritional Sciences, San Diego, United States, ²San Diego State University, School of Public Health, San Diego, United States, ³Harvard University T.H. Chan School of Public Health, Department of Nutrition, Boston, United States, ⁴San Diego State University, Department of Psychology, San Diego, United States

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: U.S. Hispanic/Latino households experience a high prevalence of food insecurity and nutrition-related chronic disease risk factors. While households often leverage resources to manage food insecurity, mixed-methods evidence is needed to identify behavioral intervention targets. This mixed-methods study sought to elucidate

SHORT ORALS

protective factors promoting household food security and diet quality among U.S. Hispanic/Latino adults.

Methods: Guided by the Socioecological Model and a capacity-oriented approach, we conducted a cross-sectional convergent parallel mixed-methods study with Hispanic/Latino adult (≥ 18 years) patients at a Federally Qualified Health Center in San Diego, CA. Participants completed VeggieMeter® skin carotenoid scans (objective correlate of fruit and vegetable intake), the 6-item U.S. Household Food Security Module Short Form, and a focus group. For analyses, we dichotomized carotenoid levels by the sample median (≥ 249 (high) vs. <249 (low); range: 128 – 452) and used the 4-category household food security status (high, marginal, low, very low). We integrated thematic content analysis of focus group data with quantitative data by comparing multi-level influences and food provisioning strategies by carotenoid level and household food security status.

Results: Among 45 participants across 8 focus groups, most (73.3%) experienced some level of household food insecurity (marginal ($n=3$), low ($n=17$), very low ($n=13$)). In the mixed-methods analysis, many participants with high carotenoid levels reflected on learning about food provisioning strategies from their parents and most discussed proactive, weekly engagement with a variety of purposeful and culturally relevant strategies related to economical meal planning, food shopping, food acquisition (including accessing free produce), and meal preparation. In contrast, most participants with low carotenoid levels discussed fewer proactive and purposeful food provisioning strategies. Comparisons by household food security status were less distinct; many participants with some level of food insecurity reported using a variety of purposeful food provisioning strategies, whereas participants with high food security reported using fewer strategies.

Conclusion: A combination of knowledge, skills, social networks, and available food resources facilitated access to nutritious, culturally relevant foods for Hispanic/Latino adults, underscoring the complex process of maintaining a healthy diet and food security. Enhancing multi-level health-promoting resources may improve diet quality among Hispanic/Latino households even in the context of food insecurity.

SO.2.16-13

Socioeconomic Difference in Cardiovascular Disease: The Mediating Role of Environmental and Lifestyle Factors in the Maastricht Study

J. Chan¹, J. Albers¹, J. Lakerveld², M. Schram³, A. Koster¹, H. Bosma¹

¹Maastricht University, Department of Social Medicine, Maastricht, Netherlands, ²Amsterdam UMC, Department of Epidemiology & Data Science, Amsterdam, Netherlands, ³Maastricht University, Cardiovascular Research Institute, Maastricht, Netherlands

SO.2.16 Socio-economic inequalities: The Intersection of Inequity, Diet, and Health: Global Perspectives on Food Security

Room 7, May 29, 2026, 2:00 PM - 3:00 PM

Purpose: Individuals with lower socioeconomic position (SEP) are at a higher risk of developing cardiovascular disease (CVD). Harmful neighborhood conditions may contribute to higher allostatic loads and additionally make it more difficult to achieve healthy behaviors as a result of poor design and unfavorable social environments. We investigated the relationship between SEP and incident CVD and aimed to determine whether the environment independently, and jointly with lifestyle factors, mediated this association.

Methods: Data from 7,195 participants with a mean age of 59.5 years (52.1% female) from The Maastricht Study in the Netherlands were used. Self-reported education level was utilized as an indicator of SEP. The food environment was measured using GIS data enriched by a food outlet healthiness rating index. Walkability and social cohesion were gathered from questionnaires. Diet quality was obtained from the Dutch Healthy Diet index 2015 derived from a food frequency questionnaire. Physical activity was measured by a thigh worn accelerometer while alcohol and smoking use were self-reported. A standardized composite score was calculated for the environment (food environment, walkability, social cohesion) and lifestyle factors (diet, moderate-to-vigorous physical activity, alcohol, smoking). CVD incidence was defined by self-reported non-fatal events in an annual questionnaire over up to an 11-year follow-up period. Generalized structural equation modeling tested the mediating effects of the environmental and lifestyle factors, and the serial pathway of the environment through lifestyle factors between education and CVD.

Results: Lower education was associated with a higher risk of developing CVD (HR: 1.08; 95% CI: 1.03, 1.12). Harmful environments independently mediated 12.4% of this association (HR: 1.01; 95% CI: 1.00, 1.02), while 62% was mediated by harmful lifestyle factors (HR: 1.04; 95% CI: 1.03, 1.05). Harmful environments through harmful lifestyle factors mediated a small proportion (3.1%) of the effect of lower education and CVD (HR: 1.00; 95% CI: 1.00, 1.00).

Conclusion: This study shows that harmful lifestyle factors mediated a greater proportion of the association between

SHORT ORALS

low SEP and CVD while the neighborhood environment had a smaller influence, both independently and jointly. Further studies should investigate additional environmental exposures, behaviors, and risk factors on the pathway to CVD.

SO.2.17-01

Exploring Parental Needs and Municipal Capacity for Parent-focused Interventions in Public Health through Implementation Science

K.H. Vinje¹, B. Meshkovska¹, N. Lien¹

¹University of Oslo, Department of Nutrition, Oslo, Norway

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel
Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Parent-focused interventions play a key role in shaping children's health behaviours and supporting healthy family food environments, yet how these interventions can be implemented, sustained and adapted to local contexts, is not well understood. In addition, such interventions can be less effective if failing to meet actual needs and preferences of the target group. Guided by implementation science and the Interactive Systems Framework for Dissemination and Implementation (ISF) this study examines how governance and service delivery interact to affect implementation success.

Methods: The study was conducted in a Norwegian municipality, providing an in-depth case to understand how local structures and context shape intervention initiation, implementation, and sustainability. A qualitative design was used, with semi-structured interviews (n=14) and focus groups discussions (n=4) involving municipal leaders and frontline staff to explore implementation strategies and processes. In addition, semi-structured interviews with parents (n=12) were used to explore experiences and needs for support to promote healthy dietary habits for children. Interviews were analysed using reflexive, thematic analysis.

Results: Preliminary findings show that parents needed more practical guidance on how to manage their children's changing food preferences through different developmental stages, as well as support that could strengthen their confidence in ensuring their children receive adequate and balanced nutrition. While the municipality staff valued evidence-based practice, understanding of what this involves varied. There was a desire for innovation, but efforts seemed to lack formal structures and relied on individual initiative facing limitations as time and competing priorities. At the same time, leaders expressed encouragement and support of innovations from frontline personnel, which they thought would increase engagement and the chances of successful implementation. They also had experienced that interventions were more likely to succeed when timing and shared interests among key actors aligned.

Conclusion: The study highlights that municipal implementation capacity depends on interactions between leadership and frontline systems. More broadly, the study contributes to implementation science in public health by showing how municipalities can improve readiness, collaboration, and sustainability of interventions. Findings will, together with the insights from the parent's interviews, guide the co-creation of an intervention to support healthy food parenting practices.

SO.2.17-02

How Boys and Girls Differ in Sedentary Time and Physical Activity across Daily Domains: The IDEA-kids Study

D. Rodriguez-Sanchez¹, P. Campos-Garzón², A. Ramírez-Osuna¹, M. Herrada-Robles¹, J. Heidler³, C. Cadenas-Sanchez¹, P. Chillón¹, F.J. Huertas-Delgado⁴

¹University of Granada, Faculty of Sport Sciences, Department of Physical Education and Sports, Granada, Spain,

²Karolinska Institutet, Department of Global Public Health, Stockholm, Sweden, ³Southern University of Denmark, Department of Sports Science and Clinical Biomechanics, Odense, Denmark, ⁴La Inmaculada Teacher Training Centre, University of Granada, Department of Visual, Music and Corporal Expression, Granada, Spain

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel
Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: To examine gender differences in device-measured sedentary time (ST) and physical activity (PA) across daily space-time domains (home, school, other locations, and total day) and transport modes among Spanish children, acknowledging that movement behaviors vary by context.

Methods: Participants were 143 children (42.7% girls; mean age=10.9±0.6 years) from the IDEA-Kids study. Children wore accelerometers (ActiGraph GT3X+) and GPS (Qstarz BT-Q1000XT) in 2024–2025 from three rural Spanish schools. Days with ≥10h of valid wear were included (mean=5.1±2.1 valid days per participant). GPS data linked accelerometer records to four space-time domains: home (within each child's residential buffer), school (school campus during school hours), other locations (anywhere else), and total day. For each valid day, the percentage of time spent in ST, light PA (LPA), and moderate-to-vigorous PA (MVPA) was computed. Transport modes (walking, cycling, and vehicle) were identified from GPS trips and analyzed as the percentage of daily transport time. Linear mixed-effects models (domain × gender; mode × gender) with random intercepts for participants were fitted, adjusted for age and daily wear time.

Results: Children spent on average 63% of their total day in ST, 32% in LPA, and 5% in MVPA. At home and school, sedentary behaviors predominated, while most MVPA occurred in other locations and during transport. After adjustment, girls spent a higher proportion of time sedentary at home ($p=0.007$), whereas boys accumulated more MVPA in other locations ($p<0.001$). No significant gender differences were observed for total-day distributions of ST, LPA, or MVPA. During transport, girls spent more of their travel time walking (36% vs. 27%; $p<0.001$), boys spent more time in vehicles (63% vs. 58%; $p=0.001$), and cycling did not differ significantly between genders (7% vs. 9%; $p=0.102$).

Conclusion: Although no overall gender differences were found in total daily ST and PA, domain-specific analyses revealed distinct patterns between boys and girls. Girls were more sedentary at home and walked more during transport, while boys were more active in community settings. These results confirm that movement behaviors are domain- and context-specific and support the need for targeted, gender-sensitive interventions to increase PA and reduce ST among children.

SO.2.17-03

Understanding the Wishes and Needs of Young Children and Key Stakeholders for Promoting Physical Activity in Young Children

K.M. Bel^{1,2}, S.B. Nijenhuis³, E. Hartman³, S.I. de Vries^{2,1}

¹The Hague University of Applied Sciences, Centre of Expertise Health Innovation, The Hague, Netherlands, ²Leiden University Medical Centre Health Campus The Hague, Department of Public Health and Primary Care, The Hague, Netherlands, ³University Medical Center Groningen, University of Groningen, Department of Human Movement Sciences, Groningen, Netherlands

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel
Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Physical activity (PA) levels among young children have declined in recent decades, mirroring global patterns linked to negative health outcomes. A recent study conducted across 33 countries showed that only 49.2% of the 3- and 4-year-old children meet the World Health Organization's PA guidelines (Chong et al., 2024). These findings highlight the urgency of developing early, context-sensitive strategies to promote PA in early childhood. To ensure such strategies are meaningful and sustainable, it is crucial to adopt a systems approach that actively involves children, parents, and professionals in co-creating PA promoting strategies.

Methods: Prior to the co-design method, an empathize phase was conducted to explore the underlying factors and actors that influence PA behavior among children aged 3 to 6 years. Through participatory activities, children completed movement themed workbooks and took photographs of places where they enjoyed or disliked being active. We discussed these with parents. Parallel to this, a local community of practice was established, bringing together key stakeholders (e.g., early childhood educators, health professionals, policymakers) to identify additional needs and contextual barriers and facilitators of PA, exchange practice-based insights and to ensure the sustainable implementation of the systems approach. Findings from these sessions were translated into personas and design requirements that could be used in co-designing the systems approach.

Results: The empathize phase revealed a diverse set of wishes and needs next to interacting factors and actors influencing young children's PA, ranging from parental attitudes and peer interactions to environmental opportunities and institutional policies. Stakeholders emphasized the need for flexible, locally adaptable interventions that connect family, school, and community settings.

Conclusion: Gathering qualitative data among young children and key stakeholders on preferences, needs and

SHORT ORALS

perceived barriers provides a deeper understanding of the complex, multi-level influences on children's PA and helps in defining requirements for co-designing systems approaches. Involving children, parents, and professionals as equal partners offers a promising pathway toward developing sustainable, contextually relevant strategies to promote PA in early childhood.

SO.2.17-04

What Is the Relationship between Outdoor Risky Play and Health in Children?

R. Ramsden^{1,2}, A. Jerebine³, M. Brussoni^{1,2}, H. Dodd⁴

¹University of British Columbia, Department of Pediatrics, Vancouver, Canada, ²BC Children's Hospital Research Institute, Vancouver, Canada, ³Deakin University, Institute for Physical Activity and Nutrition, School of Health and Social Development, Melbourne, Australia, ⁴University of Exeter, Faculty of Health and Life Science, Exeter, United Kingdom

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel

Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Risky play is a thrilling and exciting form of free play that involves elements of uncertainty and the possibility of physical injury, and includes activities such as climbing to heights, moving at high speeds, using tools and engaging in rough-and-tumble play. In recent years, a growing body of research has heightened awareness of the potential benefits of outdoor risky play for children's health. The purpose of this systematic review is to synthesize the evidence regarding the relationship between outdoor risky play and health outcomes among children aged 3-12 years.

Methods: A systematic literature search of five databases identified eligible studies that assessed associations between children's (ages 3-12) outdoor risky play and health outcomes. Measures of risky play as an exposure variable were included as well as categories of risky play behaviours. Health outcomes were defined as 'a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity'. Quantitative and qualitative data were analyzed by quantitative narrative synthesis and qualitative framework synthesis, respectively, and synthesized using a Pillar Integration Process.

Results: A total of 71 studies met the criteria for inclusion. Four categories of exposure were identified: general risky play (n=12); environments that support risky play (n=20); independent mobility (n=18); and rough-and-tumble play (n=21). Health outcomes were grouped into physical, mental health and well-being, aggression, social, cognitive, and risk competence and injury outcome categories. Quantitative studies showed an overall positive effect of risky play on physical health-related outcomes, in particular children's physical activity levels. Mixed findings were synthesized for mental health and well-being, aggression, social, cognitive, and injury and risk competence outcomes. Qualitative studies identified a wider range of health outcomes than those investigated quantitatively, providing direction for future enquiry. Study quality across included papers was low to moderate, outlining a need for higher quality research in this field.

Conclusion: These results offer insights into how children's health is influenced through participation in thrilling and challenging play experiences. Importantly, this review affirms the significant contribution of risky play experiences to children's physical activity participation.

SO.2.17-05

The Impact of LifeLab Dublin: A Co-designed Youth Health Literacy Intervention

L. Burke¹, S. Belton¹, M. Manninen¹, N. Gavigan¹, H. Goss¹

¹Dublin City University, School of Health and Human Performance, Dublin, Ireland

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel

Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Health literacy is vital to good health and wellbeing, and recognised as a critical determinant of health. Research has shown health literacy to consistently and persistently exist on a social gradient. Strong calls have been made for co-designed, integrative, and preventative approaches to improving health literacy, and schools have been proposed as a vital context for embedding health literacy programmes. LifeLab Dublin is a health literacy intervention co-designed by and for post-primary students in Ireland. Specifically, LifeLab was co-designed by students and

SHORT ORALS

teachers from identified areas of disadvantage over the last five years, leading to the co-development of a nine-week intervention programme. The purpose of this study was to evaluate the impact of participation in LifeLab on health literacy and well-being in a cohort of Irish adolescents from communities at risk of disadvantage and social exclusion.

Methods: Four schools took part in this study, across 15 class groups with a total of 352 students. Pre-tests were conducted a week before schools started the programme, post-tests within a week following completion, and retention tests at three and six months. Participants completed health literacy and wellbeing assessments including HLSAC, WHO-5 and Kidscreen-27. Data was analysed using a mixed-effects model implemented in R.

Results: Analyses indicated significant improvements in HLSAC health literacy scores over time ($p < 0.001$ & Cohen's $d_z = 0.37$), sustained at 3- and 6-month follow-ups. WHO-5 well-being scores also increased significantly ($p < 0.05$ & Cohen's $d_z = 0.03$). Kidscreen-27 results varied by domain, with gains in physical and psychological well-being but not in school environment or autonomy. Improvements were maintained at retention, suggesting sustained impact.

Conclusion: Findings demonstrate the potential of LifeLab in positively impacting the health literacy levels of adolescents. Future research is warranted to evaluate the impact of LifeLab against a control group, and follow up over a longer period of time. These findings, taken in consideration with previous participatory and qualitative work, point to the need to explore the feasibility of LifeLab intervention at scale.

SO.2.17-06

Communitites4Walkability: Investigating Walkability for Children and Young People Living in Rural Australia

I. Loos¹, K. Jose¹, A. Timperio², M. Davern³, Y. Laird⁴, S. Rowbotham⁵, G. McGrath¹, V. Cleland¹

¹Menzies Institute for Medical Research, Hobart, Australia, ²Deakin University, Melbourne, Australia, ³RMIT University, Melbourne, Australia, ⁴University of Sydney, Sydney, Australia, ⁵Curtin University, Perth, Australia

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel

Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Walking offers significant health benefits and supports independence and social connection for young people. While strong evidence links the physical environment to walking behaviour, most research has focused on urban settings. Children and young people living in rural and regional communities remain underrepresented in research. This study explored community-identified walkability barriers and facilitators in rural Tasmania, Australia, focusing on perceived needs for children and young people.

Methods: This mixed-method study used a citizen science approach to engage rural community members in assessing the walkability of their town and identify priorities for action. Eighty-seven citizen scientists (age 12-65+years) across 10 rural towns completed quantitative walkability audits, including 473 photographs. Fifty-six participants attended workshops held in each town and were asked to consider the needs of children and young people to identify key issues, priorities and solutions. Thematic analysis of workshop transcripts and audit photographs was conducted.

Results: Barriers for young people included limited safe access to destinations due to lack of footpaths, connectivity, pedestrian crossings, unsafe intersections associated with speeding traffic and poor visibility (*"You're crossing on a junction, you've got traffic coming from three possible ways... that's one of the main barriers to my kids walking independently."*). Poorly maintained footpaths and physical obstacles were additional barriers for those walking with prams. Facilitators identified were connected footpaths with buffers between pedestrians and vehicle (*"That's when formed pathways are more important, because it enables... younger people with children... to be a bit safer."*), recreational spaces, pedestrian-friendly signage, and curbs for those walking with prams. Identified priorities for action to support children and young people were lower speed limits (*"Lowering the speed... It's 50 at the moment? The school is just there, these kids run round."*).

Conclusion: Findings illustrate the importance of ensuring pedestrian infrastructure addresses the needs of rural children and families. Investing in pedestrian infrastructure and traffic safety features especially around key community destinations used by young people such as bus stops, schools, and recreational areas may encourage more young people to walk and create positive flow-on effects for other community members.

SO.2.17-07

Sociodemographic Patterning of Adventurous Play: An Update from the 2025 British Children's Play Survey

P. McCrorie¹, R. Nesbit², L. FitzGibbon³, B. Longdon¹, B. Oliver⁴, H. Dodd¹

¹University of Essex, Public Health and Sport Sciences, Essex, United Kingdom, ²University of Essex, Psychology, Essex, United Kingdom, ³University of Stirling, Psychology, Stirling, United Kingdom, ⁴University of Reading, Psychology, Reading, United Kingdom

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel
Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Adventurous (or risky) play - thrilling, exciting play involving some fear and uncertainty – supports physical activity and good mental health in children, yet opportunities may differ across social and demographic groups. This study examines sociodemographic differences in children's adventurous play across the United Kingdom using new data collected in 2025.

Methods: A nationally representative survey of 2,022 parents of 5–11-year-olds was conducted by YouGov. Parents reported the time their child played in multiple locations. The level of adventure in each place was rated on a five-point scale (1 = very low to 5 = maximum). Total hours per year in adventurous play were calculated by summing time across locations rated ≥ 2 (mild adventure or higher).

Child age, gender, ethnicity, social grade, birth order, learning difficulties, physical disability, urbanicity, and UK region were modelled separately with covariates informed by directed acyclic graphs. Because the outcome was zero-inflated and right-skewed, a two-part hurdle model was used: (1) probit regression estimating whether children engaged in any adventurous play; and (2) a generalised linear model (gamma family, log link, hrs/year) restricted to those who engaged in any adventurous play.

Results: The probability of any adventurous play did not differ significantly by age, though it declined slightly from 5 to 11 years. The GLM showed a significant quadratic age pattern: predicted means were 1,121 hours at age 5, 997 at 7, and 1,293 at 11 (turning point ≈ 7.4 years). Boys averaged more adventurous play than girls (1,209 vs 990 hours; $p < 0.001$). No significant effects were found for ethnicity, birth order, social grade, urbanicity, or physical disability. Children with learning difficulties showed marginally lower participation (93% vs 96%). Children from London engaged in highest levels of adventurous play (1,381 hours), due primarily to high levels reported at age 11, likely linked to independent mobility.

Conclusion: Adventurous play appears broadly equitable across UK sociodemographic groups, though age, gender, and regional differences persist. A mid-childhood dip (≈ 7 years) may represent a developmental transition point. Findings reinforce the value of supporting adventurous play environments, particularly for girls and regions with fewer opportunities.

SO.2.17-08

Examining How Outdoor Play Space Design and Loose Parts Integration Influence Children's Fundamental Movement Skills and Engagement across Diverse Physical Activity Intensities

N. Joshi^{1,2,3}, M. Stone^{1,3}, J. Loebach⁴, D. Rainham^{1,3}, B. Feicht^{1,3}, S. Truong^{1,3}

¹Dalhousie University, Health and Human Performance, Halifax, Canada, ²St. Francis Xavier University, Health, Antigonish, Canada, ³Healthy Populations Institute, Halifax, Canada, ⁴Cornell University, College of Human Ecology, Ithaca, United States

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel
Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: To examine how outdoor play space features, in combination with outdoor loose parts play (OLPP), influence children's fundamental movement skills (FMS) and physical activity (PA).

Methods: Data were collected from two after-school programs in Nova Scotia, Canada, following a six-week OLPP intervention. Site A was a nature-based setting (trees, expansive open space), while Site B featured an asphalt basketball court and smaller green areas. Behavioural mapping captured children's FMS (locomotor, object control,

SHORT ORALS

stability) and PA intensities (stationary, slow/easy, moderate-to-vigorous physical activity [MVPA]) using the Movement Observations during Play (MOP) tool developed for this study, alongside the Children's Activity Rating Scale (CARS). Descriptive analyses summarized behaviours, and binary logistic regression (odds ratios; OR) was employed to assess associations between loose parts (LP) and FMS and PA.

Results: A total of 612 play observations were recorded at Site A and 563 observations at Site B. Play patterns differed between sites and across features. At Site A, open space and trees generated the most observations ($n = 384$, 62.7%; $n = 173$, 28.3%). In open spaces, object control (40%) and slow/easy movement (43%) were the most frequent play behaviours, as was locomotor play without LP (OR = 4.26). Stability skills were less likely in open space alone but twice as likely when natural materials were used. When using LP, children were significantly more likely to combine FMS in their play. At Site B, open space ($n = 217$; 35.5%) and the basketball court ($n = 227$; 40.3%) supported higher-intensity play (MVPA). In these open spaces, object-control activities significantly increased with LP use (OR > 10); locomotor-object control movement combinations were also more frequent with LP, particularly manufactured materials (OR = 9.61). Object-control activities were also predominant in the basketball court (45% of observations) and more than half of play observations were at MVPA. At both sites, trees supported stability-based play, yet more so without LP.

Conclusion: Outdoor play space features, in conjunction with LP, afford distinct movement opportunities and increase the likelihood of movement combinations. Outdoor environments should be restructured to offer diverse play affordances as a mechanism for supporting children's FMS development and PA.

SO.2.17-09

"It's Way Fun" or Is it "Really Too Tiring"? Students Discuss the 'Pau Te Hau' High-intensity Interval Training Programme

D. Atkins¹, N. Harris¹, I. Warbrick¹, R. Taylor², A. Parker³, J. Pratt¹, N. Penetito-Hemara¹, D. Lubans⁴

¹Auckland University of Technology, School of Sport, Exercise and Health, Auckland, New Zealand, ²Otago University, Department of Medicine, Dunedin, New Zealand, ³Victoria University, Melbourne, Institute for Health and Sport, Melbourne, Australia, ⁴University of Newcastle, School of Education, Newcastle, Australia

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel

Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Exploring how students engage with and respond to high-intensity interval training (HIIT) in schools contributes to the knowledge needed for successful praxis. This presentation aims to share how students experienced the *Pau te Hau* high-intensity interval training (HIIT) programme from a socio-cultural perspective. By centering student voices, the study explores students' perspectives on the inclusion of Mātauranga Māori (through indigenous narratives), the use of digital technologies, and their learning about physical activity. These aspects all contributed to shaping the outcomes of the intervention.

Methods: The *Pau te Hau* programme consisted of 10–15 minute HIIT sessions, delivered 2–3 times weekly by generalist teachers ($N = 17$) to 10-year-old students ($N = 401$) over one school term (nine weeks). Students followed the *Pau te Hau* app which was instrumental in the delivery of the programme, supported by the generalist teacher facilitating each session. At the end of the intervention, 58 focus group interviews were conducted with students in groups of 5–6 (36 girls and 22 boys), and these were recorded and thematically analysed.

Results: Students found the *Pau te Hau* HIIT programme highly enjoyable, often describing it as "way fun" and sometimes "the exercises is they're like too tiring". However, they mostly appreciated the chance to exercise with friends, which fostered social connection. The integration of Mātauranga Māori (indigenous knowledge) gave the programme cultural relevance, deepening students' sense of belonging and making the experience more meaningful. The use of instructional videos and digital tools made sessions more engaging and accessible, keeping students motivated. Overall, students viewed *Pau te Hau* as a positive, enjoyable, and culturally rich programme that supported both their physical and social development.

Conclusion: The *Pau te Hau* intervention enabled the voices of children to be heard, offering critical insights into how students engaged with HIIT, and the effects on their learning and wellbeing. By actively listening to students, the programme revealed the value of culturally relevant and technology-supported approaches in promoting positive educational and health outcomes. These perspectives are essential for informing future practice, ensuring that interventions are responsive to students' lived experiences and genuinely support their development.

SO.2.17-10

Digging Deeper: What Are the Key Elements of School Gardening?

G. Zeinstra¹, I. de Leeuw², A. Haveman-Nies²

¹Wageningen University & Research, Wageningen Social & Economic Research, Wageningen, Netherlands, ²Wageningen University & Research, Consumption & Healthy Lifestyles, Wageningen, Netherlands

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel

Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: School gardening programmes are used to promote healthy eating among children and to provide them with nature education. However, the programmes vary largely in set-up and design. The aim of this study was to develop an overarching model intervention for school gardening programmes, describing a set of key intervention elements that contribute to effectiveness.

Methods: The model intervention was developed through close collaboration between science and practice. First, a literature scan on school gardening interventions was executed to extract effective key intervention elements, potential mechanisms of change, and barriers and facilitators for implementation. Second, stakeholder workshops were conducted to gather insights from practice and create consensus on the key intervention elements, criteria, and goals.

Results: Fourteen review articles were included, revealing considerable variation in the school gardening programmes, with the number of gardening sessions varying between 3 to 72 lessons. The reviews showed that school gardening programmes can be effective on various child outcomes, with strongest evidence for positive effects on children's fruit and vegetable eating behaviour.

Insights from both the literature scan and stakeholder workshops led to a list of 11 key elements for effective school gardening among children aged 8-12 years. Important behaviour change techniques that were used in the school gardening programmes were knowledge development, repeated exposure, social influence and role modelling, experiential learning, repetition of behaviour, and a sense of ownership and active involvement of the children.

Sufficient funding, availability of human resources, high commitment and expertise of those delivering the program, availability of a school garden, institutional support within the school, and the integration of gardening within the school curriculum were identified as important factors facilitating implementation.

Conclusion: The school gardening model intervention is the first model intervention that was included in the Dutch intervention database of the National Institute for Public Health and the Environment (RIVM). By providing an overarching framework with key intervention requirements, the model intervention boosts quality improvement and is an important step towards evidence-based school gardening interventions that effectively change children's behaviours.

SO.2.17-12

Father's Motivation as a Driver of Reciprocal Reinforcement in Father-child Dyads: Associations with Obesity-related Behaviors and Weight Status

J.A. Jimenez Garcia¹, S. Musaad¹, E. Arredondo², A. Beltra¹, P. Morgan³, J. Rueda⁴, E. Soltero¹, J. Zachariah¹, T. Baranowski¹, T. O'Connor¹

¹Baylor College of Medicine, Pediatrics, Houston, United States, ²San Diego State University, Psychology, San Diego, United States, ³University of Newcastle, School of Education, New South Wales, Australia, ⁴Baylor College of Medicine, Medicine, Houston, United States

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel

Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Reciprocal reinforcement (RR) describes mutual influence in father-child health behaviors through dynamic feedback. As a first step toward measuring RR, we developed and validated a father-focused instrument with two scales: motivation to engage in health behaviors for oneself (F-RR) and for one's child (C-RR). Based on the premise that paternal motivation can initiate RR processes, we examined associations between F-RR and C-RR and father-child health outcomes.

Methods: We analyzed data from 187 father-child dyads (fathers: age=39.86±7.09; 46% overweight, 54% obese; children: age=8.26±1.79; 37% female; 52.94% overweight/obese) participating in a community-based efficacy trial.

SHORT ORALS

Sociodemographic, anthropometric, RR, and accelerometry data were collected. Four Actor-Partner Interdependence Models (APIMs) tested associations between F-RR and C-RR and dyadic (father-child) moderate-to-vigorous physical activity (MVPA), sedentary time (ST), screen use (SU), and body mass index (BMI; BMI Z-score for children). Model assumptions were tested, and robust maximum likelihood estimation was used. Models controlled for father-child characteristics, father-reported familism, and socioeconomic status (SES) derived via multiple correspondence analysis. Global and local fit were assessed, and Monte Carlo simulations confirmed model stability.

Results: Fathers averaged F-RR=3.7(0.8), C-RR=3.8(0.8), MVPA=36.7(28.5) min/day, ST=540.2(104.3) min/day, and SU=358.3(202.8) min/day; children averaged MVPA=34.3(20.2) min/day, ST=403.6(91.4) min/day, and SU=298.1(192.2) min/day. In the APIMs, greater F-RR was associated with lower father's BMI (actor-effect, -0.91, $p<0.001$), lower father's SU (actor-effect, -66.4min/day, $p=0.015$), and higher child's MVPA (partner-effect, 3min/day, $p=0.006$). Greater C-RR was associated with reduced father's ST (partner-effect, -27.8min/day, $p=0.009$). Dyadic interdependence emerged across MVPA ($\phi=0.18$, $p<0.001$), ST ($\phi=0.19$, $p=0.046$), and SU ($\phi=0.23$, $p=0.006$). Boys had more MVPA (8.5min/day, $p=0.001$) and SU (38.5min/day, $p=0.031$). Older children had more ST (31.7min/day, $p<0.001$) and SU (23.3min/day, $p=0.003$), and less MVPA (-4min/day, $p<0.001$). Higher Familism was associated with higher father's BMI (1.1, $p=0.009$) and higher father's ST (35.1min/day, $p<0.001$). Higher SES was associated with lower child's BMI Z-score (-0.47, $p=0.006$). All models showed adequate global and local fit.

Conclusion: F-RR and C-RR are associated with father-child health outcomes. These associations and dyadic interdependence reflect reciprocal influence, positioning fathers and father-child dynamics as strategic targets for family-based lifestyle interventions.

SO.2.17-13

Shifts in Device-specific Screen Use, Physical Activity and Play among Young Children in Portugal, 2016-2024

D. Rodrigues¹, C. Padez¹, A. Machado-Rodrigues²

¹University of Coimbra, Department of Life Sciences, Research Centre for Anthropology and Health, Coimbra, Portugal,

²University of Coimbra, Faculty of Sport Sciences and Physical Education, Centre for the Study of Human Performance, Coimbra, Portugal

SO.2.17 Children and families: Promoting Movement: From Outdoor Play to Active Travel
Auditorium, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Digital media environments have evolved rapidly, yet few population-level studies have examined how device-specific screen behaviors and children's play and activity patterns have changed over time in early childhood. This study aims to compare screen use, internet exposure, physical activity, and play behaviors among Portuguese children aged 3 to 6 years in 2016 and 2024, and to examine whether changes over time persisted after accounting for child, parental, and household factors.

Methods: Two independent, nationally distributed samples of parents of children aged 3–6 years were surveyed in 2016 ($n=1,128$) and 2024 ($n=1,001$). Bivariate analyses (χ^2 tests, independent-samples t tests, and Cohen's d for effect sizes) compared sociodemographic characteristics, screen use, and physical activity across years. Logistic regression models estimated the crude effect of survey year (Model 1) and the adjusted effects of year plus child characteristics, parental behaviors, digital environment, and socioeconomic factors (Model 2) on device-specific screen use (television, computer, video games, smartphone, tablet), active and passive play, and sport participation.

Results: Children's behaviors changed substantially between years. Smartphone use more than doubled (Cohen's $d = -0.54$), while time on television, computers, and video games declined. Internet use increased (56.5% to 66.2%), and the presence of screens in bedrooms decreased. Structured sport participation was lower in 2024 (62.2% to 51.2%), whereas active play increased modestly. Logistic regressions showed that survey year remained a significant determinant of smartphone use ($\beta \approx 2.0$), computer use ($\beta \approx -1.0$), sport participation ($\beta \approx -2.5$), and passive play ($\beta \approx -1.2$) even after adjusting for demographic and parental characteristics. Devices in the child's bedroom and parental screen time were consistently associated with higher child screen use.

Conclusion: Device-specific patterns of young children's screen and activity behaviors in Portugal shifted markedly over eight years, with a pronounced move toward smartphone-based media and reduced engagement in structured sport. These trends persisted beyond demographic and household differences, reflecting broader technological and social changes shaping early childhood. Family-centered guidance on mobile media, expanded opportunities for structured physical activity, and ongoing surveillance of device-specific behaviors are needed to support healthy development in an increasingly digital early-life environment.

SHORT ORALS

SO.2.18-01

Interventions that Address Food Insecurity for Children Aged 0-11 Years, Families and Pregnant Women in the UK: A Systematic Review of Intervention Studies

C. Holt¹, N. Heslehurst², R. Kipping¹, M. Daly¹, Z. Bell³, A. Mahon¹, P. Temple⁴, A. Porter¹

¹University of Bristol, Bristol Medical School, Bristol, United Kingdom, ²Newcastle University, Newcastle, United Kingdom,

³King's College London, London, United Kingdom, ⁴Somerset Council, Public Health, Taunton, United Kingdom

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Food insecurity has increased in recent years due to economic shifts and rising food prices, with 13.6% of UK households experiencing food insecurity, of which 47% include children. This systematic review aimed to explore the impact of UK food insecurity interventions for children, families, and pregnant women.

Methods: We conducted a systematic search of seven databases and two clinical trial registers, with title and abstract screening in duplicate, for articles published between 2008 and November 2023. Forward and backward citation searches used CitationChaser. Data extraction was undertaken in duplicate by four reviewers. Peer-reviewed intervention studies were eligible if they were conducted in the UK, had an experimental design and targeted at least one food insecurity pillar (accessibility, utilization, availability, stability). Studies were eligible if most participants were children aged 0-11 years, families with at least one child aged 0-11 years, or pregnant women. We followed PRISMA guidelines and present a narrative synthesis.

Results: 18,225 articles were identified; 11 intervention studies were included. Types of interventions included: cooking interventions (n=4), free school meals (n=3), holiday clubs (n=2), supermarket vouchers (n=1), and food bags (n=1). Food availability was targeted in seven studies, food accessibility and utilization in five each, and food stability in one, only one study included food insecurity as an outcome. The interventions demonstrated a range of barriers and facilitators to inform future intervention development. Most studies were considered serious or critical risk of bias.

Conclusion: This review identified a lack of high-quality interventions addressing food insecurity in the UK for children aged 0-11 years, families and pregnant women, with most targeting food availability. Further research is needed to co-develop and test the effectiveness and acceptability of comprehensive interventions with these groups.

SO.2.18-02

Association between Caregiver Feeding Styles and Ultra-processed Food Consumption among Toddlers Aged 6–23 Months in Clark County, Nevada: A Cross-sectional Study

A. Gonzalez¹, G. Buccini¹

¹University of Nevada Las Vegas, School of Public Health, Las Vegas, Nevada, United States

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: This cross-sectional study analyzed the association between responsive and non-responsive caregiver feeding styles and ultra-processed food (UPF) consumption among toddlers aged 6–23 months in Clark County, Nevada. Given the rising prevalence of early childhood malnutrition and global increases in UPF intake despite recommendations to limit these foods before age two, understanding the role of caregiver feeding styles is essential.

Methods: We used data from a survey conducted with 235 caregivers of toddlers aged 6–23 months in Clark County, Nevada. UPF consumption was assessed based on WHO/UNICEF dietary intake guidelines. Responsive and non-responsive (i.e., laissez-faire, pressuring, restrictive, indulgent) caregiver feeding styles were evaluated using the validated Infant Feeding Style Questionnaire (IFSQ). Multivariate logistic regressions assessed the association between caregiver feeding styles and UPF adjusted for household, maternal, and toddler sociodemographic characteristics.

Results: About 57% (n=133) of toddlers consumed UPF in prior 24 hours of the survey. Responsive caregiver feeding style (AOR=0.50; p=0.030) and non-responsive restrictive feeding (AOR=0.41; p=0.005) reduced the odds of UPF consumption, while a non-responsive indulgent feeding style increased the odds of UPF consumption (AOR=2.22;

SHORT ORALS

$p=0.032$). Non-responsive laissez-faire and pressuring feeding styles showed no significant association with UPF consumption. Non-responsive caregiver feeding styles increased the risk of UPF consumption, while responsive and restrictive caregiver feeding style protected toddlers from consuming UPF.

Conclusion: Encouraging responsive and structured feeding approaches may improve toddlers' dietary quality and help mitigate early childhood obesity risk. Future research should test interventions supporting responsive caregivers feeding style to foster healthy dietary behaviors during early childhood.

SO.2.18-03

Content Validation of the Global Adolescent and Child Physical Activity Questionnaire (GAC-PAQ) for Indian Children and Adolescents

J. Bhawra^{1,2}, R. Mandlik², C. More², A. Khadilkar², R. Larouche

¹Toronto Metropolitan University, Toronto, Canada, ²Hirabai Cowasji Jehangir Medical Research Institute, Pune, India

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors
Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Physical activity (PA) surveillance among children and adolescents in India has been limited by the lack of standardized and culturally appropriate tools to measure active living behaviours. Using the evidence-based Global Adolescent and Child Physical Activity Questionnaire (GAC-PAQ) developed by an international research team, this study aimed to assess content validity in India prior to widespread use in PA surveillance studies. The GAC-PAQ assesses PA among 8- to 17-year-olds across key domains, including school, chores, work, transport, free time, and outdoor time.

Methods: As part of a larger 15-country initiative to validate and implement the GAC-PAQ, India participated in a two-phase content validation study. Phase 1: Indian PA experts completed an online survey rating agreement (5-point Likert scale: 1=strongly disagree to 5=strongly agree) with statements about relevance and comprehensiveness of each questionnaire domain. Phase 2: Structured cognitive interviews were conducted with child-parent dyads in English ($n=6$) and Marathi ($n=13$) from rural ($n=8$) and urban ($n=11$) settings. Framework analysis identified challenges and suggestions, which were triangulated across countries to inform questionnaire revisions.

Results: Expert agreement exceeded the 75% threshold across all domains. Cognitive interviews revealed India-specific challenges across multiple domains. For PA intensity, participants reported struggling to differentiate intensity levels in household and work chores. For school PA, participants reported difficulties with physical education terminology (i.e., confusion between 'physical education' and 'organized sport'), duration estimation, and intensity reporting. Cross-cutting challenges included difficulty estimating activity duration, and the need for culturally appropriate images and examples in the survey (e.g., depiction of Indian households and culturally relevant attire in images).

Conclusion: Indian participants' feedback contributed to substantial revisions including domain-specific preambles, country-specific images, simplified terminology, „don't know“ options for school questions; and removal of the work section from the child survey version. The revised GAC-PAQ will be pilot-tested in an app-based format in English, Hindi, and Marathi among urban and rural populations in India. Findings emphasize the critical importance of culturally grounded content validation when developing PA surveillance tools for diverse populations. Forthcoming implementation of the GAC-PAQ will be a critical step in addressing PA surveillance gaps in India and globally.

SO.2.18-04

Movement Behaviors in Pregnancy and Infant Body Composition: A Compositional Data Approach

J. Sandborg¹, E. Söderström Shields¹, S.J. Verswijveren², J.H. Migueles³, P. Henriksson⁴, M. Löf¹

¹Karolinska Institutet, Department of Medicine, Huddinge, Flemingsberg, Sweden, ²Deakin University, Institute for Physical Activity and Nutrition, Burwood, Australia, ³Karolinska Institutet, Department of Global Public Health, Stockholm, Sweden, ⁴Linköping University, Department of Health, Medicine and Caring Sciences, Linköping, Sweden

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors
Room 1, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: To examine associations of 24-hour movement behaviors (sleep, sedentary behavior [SB], light physical activity [LPA], and moderate-to-vigorous physical activity [MVPA]) in early and late pregnancy (gestational weeks 14 and 37) with infant body composition 1-2 weeks postpartum.

Methods: Data were drawn from the HealthyMoms trial. Movement behaviors were assessed via wrist-worn accelerometers over seven consecutive days in gestational weeks 14 (n=224) and 37 (n=226). Infant outcomes included birthweight, length, and body composition (air-displacement plethysmography). Compositional regression models were used to assess associations of movement behaviors and infant outcomes.

Results: In early pregnancy, reallocating 10 min/day to MVPA and reducing the other behaviors was associated with -23.8 g (95% CI: -44.2 to -3.38) lower infant birthweight and -0.11 cm (95% CI: -0.20 to -0.02) birth length. In late pregnancy, reallocating 10 min/day to MVPA in favor of the other behaviors was associated with -25.5 g (95% CI: -48.0 to -3.0) lower birthweight, and 30 min/day reallocation to SB from sleep was associated with 0.10 kg/m² (95% CI: 0.03 to 0.17) higher FFMI. No further statistically significant associations were observed (all $P \geq 0.089$).

Conclusion: Our findings suggest that MVPA in pregnancy is of importance for infant weight and length at birth, but the clinical relevance appears limited. Further research on how movement behavior reallocations influence infant growth, particularly through mechanisms affecting neonatal lean mass, is warranted.

SO.2.18-05

Co-designing a Prevention Program with Caregivers to Support their Mental Health and Wellbeing

S. Hunter¹, G. Middleton¹, A. Scott¹, K. Kalompratsos², A. Briley¹, K. Matvienko-Sikar³, R. Golley¹

¹Flinders University, College of Nursing and Health Sciences, Caring Futures Institute, Adelaide, Australia, ²Women's and Children's Health Network, Child and Family Health Service, Adelaide, Australia, ³University College Cork, School of Public Health, Cork, Ireland

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: The transition to parenthood is a life-changing and high-risk period for caregivers' mental health and wellbeing. This has implications for how well caregivers can look after themselves physically and mentally, and how they care for their children. To create effective and sustainable supports it is critical to involve caregiver perspectives and needs. Therefore, we aimed to identify evidence-informed supports that align to the concerns and needs of caregivers that can be implemented into routine maternal and child health services.

Methods: Guided by the Knowledge Translation Complexity Network Model, we conducted a mixed-methods triangulation study. With oversight from a caregiver advisory committee, we employed methodological triangulation with data from 1) a focus group study, 2) a service review, and 3) a scoping review.

Results: Caregivers (n=25) accessing maternal and child health services participated in focus groups to explore their mental health and wellbeing concerns. The key concerns faced by caregivers were described as the pressure of expectations, feelings of anxiety and failure, no 'village' support, mental health not addressed or supported, services being too baby focused, and feeling unprepared. Four universal services were identified through the service review and 74 studies reporting on 70 unique mental health and wellbeing interventions were identified via the scoping review. Through applying a triangulation protocol, we identified 28 triangulated findings with no disagreement across the findings, identifying opportunities to build on what maternal and child health services currently offer, to support the concerns of caregivers, informed by available evidence-based supports.

Conclusion: This study worked with caregivers to identify their mental health and wellbeing concerns and triangulated these with findings from a service review and scoping review to identify opportunities to embed evidence-based support into existing maternal and child health services. Through prioritising the voice of caregivers, the findings of this study informed the co-design of the "Caring for Caregivers" program which has been successfully pilot tested within maternal and child health services early parenting groups.

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Most research on children's technology and digital media (TDM) use has relied on parent- or self-reported TDM use resulting in possible biases and inaccurate estimates. The aim of this study was to describe demographic and environmental correlates of preschool children's objective, passively measured TDM use.

Methods: Baseline data from the ongoing Technology Effects on Children's Health (TECH) longitudinal study was used. Children's TV viewing was objectively assessed for 10-days using the FLASH-TV system on up to 3 TV's at home. Mobile device use was assessed with the Chronicle App (Android devices) or screenshots of Screentime metrics (Apple devices). Parents completed surveys including demographics and a Neighborhood Disorder scale. Staff completed a TDM home inventory with parent's assistance. The dependent variables were mean minutes/day of TV, mobile, or combined TDM use using generalized linear regression with demographic and environmental covariates.

Results: The child sample (N=111) had a mean age 4.0 (SD 0.7) with 50% girls; 45% Hispanic; and 31% Black, 16% multiracial/other and 53% White. Sixty percent of parents were college graduates/postgraduates; had a mean income-to-poverty ratio 1.88 (SD 1.25); and a range of 1-6 children living in the home. The preschoolers watched TV for mean of 50±53 minutes/day, used mobile devices for 60±92 minutes/day; with a combined use of 108±106 minutes/day; 4.5% of the children did not watch a TV and 45.1% did not use a mobile device. TDM use was higher among children from households with more mobile devices/person ($\beta \pm SE = 0.23 \pm 0.09$, $P = 0.012$), and children who have a bedroom TV ($\beta \pm SE = 0.59 \pm 0.24$, $P = 0.01$). More TV viewing was associated with the total screens at home ($\beta = 0.05 \pm 0.02$, $P = 0.042$). Greater mobile use duration was associated with more household mobile devices/person ($\beta = 0.44 \pm 0.13$, $P < 0.001$), presence of bedroom TV ($\beta = 1.62 \pm 0.46$, $P < 0.001$), fewer screens in the home ($\beta = -0.12 \pm 0.04$, $P = 0.004$), number of children in the home ($\beta = 0.31 \pm 0.13$, $P = 0.018$), and less Neighborhood Disorder ($\beta = -0.71 \pm 0.27$, $P = 0.009$).

Conclusion: Objectively-measured total TDM duration was associated with the home screen environment, however mobile device use was associated with additional factors at the home and neighborhood levels.

SO.2.18-08

Baseline Analysis of the Association between Food Insecurity and Health-related Behaviors among 4-6-year-Old Children in the COACH 2.0 Randomized Controlled Trial

C. Orr¹, A. Lorenzo¹, E. Sommer¹, S. Wallace¹, W. Heerman¹

¹Vanderbilt University Medical Center, Pediatrics, Nashville, United States

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Childhood obesity is a public health crisis for Hispanic children living in the U.S. Food insecurity (FI), or lack of consistent access to food, may influence health-related behaviors that contribute to childhood obesity. The goal of the study was to examine the cross-sectional associations between FI and the health-related behaviors of child sleep, screentime, and parenting practices around physical activity among Hispanic families.

Methods: COACH was a health behavior randomized controlled trial among Hispanic families in Nashville, TN that included a 4–6-year-old. This cross-sectional analysis included survey data from the baseline study timepoint. The exposure of interest was household FI, measured by the United States Department of Agriculture 6-item food security module. Outcomes were sleep duration (calculated from typical bedtime/waketime), screentime (frequency of digital device use and TV minutes/day), and parenting practices around child physical activity. This was measured by the Preschooler Physical Activity Parenting Practices (PPAPP) scale. The PPAPP includes the Discouragement (safety) sub-scale, the Discouragement (lack of money) single item, and the Encouragement sub-scale. Associations were

SHORT ORALS

assessed using regression models, adjusting for prespecified covariates: child age and sex, and parent education and birth region.

Results: Among 301 randomized parent-child pairs, the mean (SD) child age was 5.2 years (0.8), 25.3% of children had obesity, 33.4% experienced FI, 86.9% were insured through Medicaid, and 98.0% of parents had low acculturation. Households with higher FI had higher scores on the PPAPP discouragement (safety) sub-scale ($B=0.40$; 95% CI=[0.10, 0.69]; $p=0.009$) and higher scores on the discouragement (lack of money) item ($aOR=2.70$; 95% CI=[1.64, 4.46]; $p<0.001$). Households with FI had higher amounts of child TV minutes/day, though this did not reach statistical significance ($IRR=1.24$; 95% CI=[0.99, 1.55]; $p=0.063$). No significant associations were detected between FI and child sleep duration or frequency of digital device use.

Conclusion: In a sample of Hispanic children living in the U.S., household food insecurity was associated with significantly greater discouragement of PA due to lack of money and perceived safety and with marginally increased child screentime. Future studies are needed to clarify these relationships and inform the development of obesity treatment interventions among children and families who experience FI.

SO.2.18-09

Evaluation of Outcome Measurement Instruments Used to Measure Caregiver Feeding Practices, Feeding Environment, Diet, and Weight-related Outcomes in Infants

D. Dutch¹, M. Duffy¹, E. Looney¹, K. Matvienko-Sikar¹, on behalf of the SCOPE Project Team

¹University College Cork, School of Public Health, Cork, Ireland

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Poor quality and heterogeneous measurement of infant feeding outcomes limits evidence synthesis and intervention evaluation. However, it is currently unclear what are the best outcome measurement instruments (OMIs) to use. This systematic review aimed to evaluate the feasibility and measurement properties of OMIs used to measure core infant feeding (e.g., diet, feeding practices) and weight-related outcomes in infants aged ≤ 1 year.

Methods: OMIs for core infant feeding and weight-related outcomes identified in previous scoping reviews were screened to evaluate relevance, fit-for-purpose, and feasibility. A systematic search of PubMed, EMBASE, CINAHL, and PsycINFO databases from inception to February 2025 was then conducted to identify published development or validation articles of OMIs with infants aged ≤ 1 year. Methodological study quality, measurement properties, and quality of evidence were assessed following the COnsensus-based Standards for the selection of health Measurement INstruments (COSMIN) Initiative methodology. Evaluation of study-specific OMIs, without published development or evaluation studies, was informed by qualitative focus groups with caregivers and researchers.

Results: Thirty-five articles evaluating 41 OMIs were included in the systematic review. For caregiver and diet-related outcomes, one OMI measuring feeding method showed sufficient criterion validity, and one OMI assessing responsive feeding showed insufficient internal consistency. Three OMIs had sufficient content validity based on published evaluations, and 10 had sufficient content validity based on reviewer ratings. Four weight-related OMIs were identified: parent-reported weight, bioelectrical impedance analysis (BIA), air-displacement plethysmography (ADP PEA POD), and digital infant scales. ADP showed sufficient criterion validity for body composition. All four weight-related OMIs had sufficient content validity based on reviewer ratings. Caregivers ($n=8$) and researchers ($n=11$) reported challenges interpreting study-specific OMIs, including unclear terminology, and varied preferences for question design, response format, and recall period. Parenting experience influenced how OMIs were interpreted and completed, underscoring the need for tools that are adaptable to diverse caregiver contexts.

Conclusion: There is limited high-quality evidence supporting the measurement properties of OMIs for core infant feeding and weight-related outcomes. Gaps in content validity, internal consistency, and feasibility hinder standardised measurement in research and practice. Further refinement and evaluation of OMIs are needed to strengthen infant feeding research and intervention assessment.

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Diet during pregnancy influences fetal development, yet its effects on prenatal cardiac development remain unclear. We aimed to examine associations between maternal dietary patterns and fetal cardiac development, considering both functional and morphological outcomes.

Methods: We studied 825 pregnant women from the Barcelona Life Study Cohort (BiSC), recruited during their first trimester (2018–2021). Maternal diet was assessed at gestational week 20 using a 114-item Food Frequency Questionnaire (FFQ). Eight dietary scores were derived: Dietary Approaches to Stop Hypertension (DASH), Alternative Healthy Eating Index (AHEI), Relative Mediterranean Score (rMED), Alternate Mediterranean Score (aMED), Ultra-Processed Foods (UPF), Plant-Based Dietary Index (PDI), Healthy Plant-Based Dietary Index (hPDI), and Unhealthy Plant-Based Dietary Index (uPDI). Fetal echocardiography at gestational week 32 measured 59 parameters of cardiac function and morphology. Associations were analyzed using mixed-response sparse reduced-rank regression (msRRR) with resampling, adjusting for relevant covariates.

Results: Preliminary results suggest that AHEI, rMED and aMED were consistently associated with fetal heart function, while aMED, AHEI, uPDI, UPF, and DASH were related to morphology. Mediterranean-style diets (rMED and aMED) and AHEI were linked to cardiac function, while DASH, UPF, and uPDI showed selective associations with morphology. (The finalized results will be presented at the time of conference).

Conclusion: Our preliminary results indicated that maternal dietary patterns were associated with both functional and morphological fetal heart development. These findings highlight the potential role of maternal nutrition in shaping prenatal cardiac development, with possibly lifelong consequences.

SO.2.18-11

Evaluating a Summer Childhood Obesity Prevention Intervention: A Controlled Trial

Q. Tan¹, P. Son¹, Y. Nie¹, P. Yang¹, A. E. Staiano², F. Wang³, D. C. Shepherd⁴, K. Queen^{2,5}, S. T. Gordon^{2,6}, S. Chen¹

¹Louisiana State University, School of Kinesiology, Baton Rouge, United States, ²Pennington Biomedical Research Center, Baton Rouge, United States, ³Louisiana State University, Department of Geography & Anthropology, Baton Rouge, United States, ⁴Louisiana State University, Division of Computer Science & Engineering, Baton Rouge, United States, ⁵Our Lady of the Lake, Children's Health Weight and Nutrition Center, Baton Rouge, United States, ⁶Louisiana Healthcare Connections, Baton Rouge, United States

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Children gain excess weight during summer. This study evaluated a pilot summer childhood obesity prevention intervention, measuring effects on weight status, health behaviors, knowledge, and activity self-efficacy.

Methods: The controlled trial was conducted with 25 adolescents (intervention group[IG] n=13; control group[CG]

SHORT ORALS

$n=12$; ages 11–14) in Louisiana, USA. It included a two-week summer camp involving physical education, nutrition messaging, AI-assisted behavior management training on an APP, campus walks, and FitBit-assisted self-monitoring. Beyond the camp, participants continued using the Fitbit and APP to set and track health goals, and parents regularly received reminders and resources. CG attended a virtual coding program weekly (1hr/week). Weight/height (using Seca 777) and waist circumference (WC; using Seca 201 tape) were pre- and post-measured for both groups and IG's weight status was also measured on the final camp day. Health behaviors (i.e., physical activity[PA], diet, screen time), knowledge, and self-efficacy were pre- and post-measured using a questionnaire (PA further assessed using accelerometers). IG also wore accelerometers on camp days.

Results: MVPA averaged 120.4 ± 9.6 min/day during camp. APP usage was high during camp but declined afterwards ($M=19.2$ vs. 4.2 entries/week). Compared to CG, IG showed slightly less gains for body weight ($\Delta M=0.98$ kg vs 1.83 kg), BMI ($\Delta M=0.16$ kg/m² vs. 0.46 kg/m²), and WC ($\Delta M=3.93$ cm vs. 6.30 cm), but time*group interaction effects did not reach significance (Weight: $p=0.13$, $\eta^2=0.10$; BMI: $p=0.07$, $\eta^2=0.13$; WC: $p=0.50$, $\eta^2=0.02$). During the camp, IG's WC showed a significant decline ($\Delta M=-3.14$; $p=0.02$, Cohen's $d=-0.72$), while BMI presented a non-significant decline ($\Delta M=-0.08$ kg/m², $p=0.65$). Over the summer, the number of active days, activity self-efficacy, and knowledge favored the IG, but PA intensity and diet favored the CG (non-significant time*condition interaction effects; $ps>0.05$).

Conclusion: The pilot intervention offered structured PA, nutrition messaging, technology-assisted self-monitoring and behavior management, and parent engagement to reduce adolescents' obesity risk. The summer camp made an acute impact on weight status (i.e. WC). The overall intervention produced promising effects on weight status, health behaviors, knowledge, and self-efficacy. Future interventions should focus on removing the barriers to post-camp lifestyle changes, making summer days more structured, and involving a larger sample with random group assignments.

SO.2.18-12

An Examination of Dyadic Breastfeeding Attitudes and their Association with Maternal Breastfeeding Intention among a Sample of Non-hispanic Black Women Living in the United States

H.M. Wasser¹, K. Williams², T.N. Richardson³, M.C. Kay⁴, L.H. Bookhart⁵, I.R. Headley¹, M.K. Hoke⁶, E. Hosein⁶, J.A. Mackessy⁶, A.L. Thompson⁶

¹University of North Carolina at Chapel Hill, Nutrition, Chapel Hill, United States, ²University of Alabama, Social Work, Tuscaloosa, United States, ³East Carolina University, College of Nursing, Greenville, United States, ⁴Wake Forest University, School of Medicine, Winston-Salem, United States, ⁵University of North Carolina at Chapel Hill, Maternal and Child Health, Chapel Hill, United States, ⁶University of North Carolina at Chapel Hill, Anthropology, Chapel Hill, United States

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Our study uses data from the „Mothers & Others“ (M&O) randomized controlled trial to describe the extent to which mothers and study partners hold similar attitudes toward breastfeeding and whether dyadic breastfeeding attitudes are associated with maternal breastfeeding intention, the most robust predictor of breastfeeding behavior in the M&O cohort.

Methods: Data are from 299 mothers and study partners (fathers, grandmothers, other relatives, non-relatives) who participated in M&O. All data come from the baseline survey administered at 28 weeks of pregnancy. Breastfeeding attitudes were measured among both mothers and partners using the Iowa Infant Feeding Attitude Scale (IIFAS), ranging from 17 (most positive attitude toward feeding commercial milk formula) to 85 (most positive attitude toward breastfeeding). Dyadic breastfeeding attitude scores were calculated by subtracting the partner's IIFAS score from the mother's. Dyads were also categorized into 4 groups according to breastfeeding attitudes, with high defined as $IIFAS \geq 60$: mother-low/partner-low, mother-high/partner-low, mother-low/partner-high, mother-high/partner-high. Maternal intention to breastfeed was measured using the Infant Feeding Intention Scale (IFIS), ranging from 0 (strong intention not to breastfeed) to 16 (strong intention to exclusively breastfeed for 6 months). Linear regression models were used to test for associations between categorical dyadic breastfeeding attitudes (referent: mother-low/partner-low) and maternal breastfeeding intention.

Results: Mean breastfeeding attitude score was 60.4 ± 7.6 for mothers and 58.4 ± 7.9 for partners, and mean breastfeeding intention score was 10.2 ± 4.7 . Differences in breastfeeding attitudes between mothers and partners ranged from 0 (perfect agreement) to ± 36 points. 34.8%, 26.1%, 11.4%, and 27.8% of dyads had breastfeeding attitudes categorized

SHORT ORALS

as mother-low/partner-low, mother-high/partner-low, mother-low/partner-high, and mother-high/partner-high, respectively. Categorical dyadic breastfeeding attitudes explained 25% of the variance in breastfeeding intention. As compared to mother-low/SP-low dyads, breastfeeding intention was higher among all other categories: mother-high/partner-low (B -coefficient=4.79, 95% Confidence Interval: 3.63-5.96), mother-low/partner-high (B =1.86: 0.36-3.35), and mother-high/partner-high (B =4.61: 3.45-5.77).

Conclusion: Maternal intention to breastfeed was higher when one or more dyad members had a high breastfeeding attitude, even when maternal breastfeeding attitude was low. In the breastfeeding literature, breastfeeding intention consistently predicts breastfeeding behavior, thus findings highlight the importance of targeting prenatal breastfeeding attitudes of multiple family members and support persons.

SO.2.18-13

Co-designing a Nutrition and Exercise Lifestyle Intervention Program (NELIP) Sensitive to Culture and Religion to Prevent Gestational Diabetes in Marginalized Arab Muslim Pregnant Women

M.F. Mottola^{1,2,3}, S. Mahakul¹, J. Miller¹, S. Hussien¹, E. Somogyi¹

¹University of Western Ontario, Kinesiology, London, Canada, ²University of Western Ontario, Anatomy & Cell Biology, London, Canada, ³Children's Health Research Institute, London, Canada

SO.2.18 Children and families: Early-Life Nutrition, Sleep, and Sedentary Behaviors

Room 1, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Previous work using a Nutrition and Exercise Lifestyle Intervention Program (NELIP) showed that this strategy prevents gestational diabetes mellitus (GDM) and excessive gestational weight gain. However, NELIP may not work for all populations especially marginalized high-risk groups without considering culture and religious beliefs. We developed a template for co-design with a patient-centred holistic approach based on the **Obesity-Related Behavioural Intervention Trials** or **ORBIT** model that can be used for any diverse population. Our purpose was to explore how culture and religion influenced nutrition and physical activity behaviours in high-risk pregnant Arab Muslim women as the first phase in co-design.

Methods: After consultation with leaders in the Arab Muslim community to advise on how to approach pregnant women, and how to ask culturally appropriate questions, we recruited pregnant or up to 1-year postpartum individuals to participate in a 2-hour structured interview in either English or Arabic. The interviews were translated and transcribed. Summative content analysis was used to identify their behaviours, and thematic content analysis was used to identify themes on how culture and religious beliefs influenced nutrition and physical activity behaviours.

Results: Thirty-two participants (11 pregnant/21 recently pregnant), with a mean age of 30.9 ± 6.5 years, time since immigration 7.4 ± 7.5 years and a mean household size of 5.2 ± 2.1 persons, were interviewed. Four themes emerged; Nutrition as a central focus associated with several cultural and religious traditions; Daily physical activity integrated into everyday life; Health of the baby; and Factors involved in lifestyle choices. Nutrition was a priority over physical activity and exercise was not encouraged during pregnancy, however, walking and prayer were the most popular. Of daily physical activities, cooking (97%) and grocery shopping (81%) were the most enjoyed.

Conclusion: Culture and religious beliefs are extremely important and highly influence behaviour. Exercise was not considered as important as nutrition and thus for an intervention to be successful, nutrition and dietary education should be included with a physical activity component linked to prayer and cultural beliefs.

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration

Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Stroke survivors remain at high risk of major adverse cardiovascular events (MACE). International guidelines emphasize reducing sedentary behaviour and promoting physical activity as one of the key strategies for stroke prevention and rehabilitation. However, evidence on the association between post-stroke movement behaviour patterns and long-term cardiovascular outcomes is limited. Understanding these associations may help identify individuals who would benefit most from targeted movement-based secondary prevention. This study aimed to examine whether post-stroke movement-behaviour patterns are associated with the six-year risk of MACE and all-cause mortality.

Methods: A prospective cohort study was conducted using data from 190 participants with a first-ever stroke (age = 68.1 ± 11.0 years; 65% male; median NIHSS= 3), who were discharged to their home environment. Movement-behaviour patterns were objectively assessed using accelerometry (Activ8) within the first weeks after hospital discharge. Participants were classified into active or inactive movement-behaviour groups with cluster analysis. Associations with MACE were evaluated using cause-specific Cox proportional hazards models, adjusting for potential confounders. The association with all-cause mortality was analyzed in a separate model. The proportional hazard assumption was evaluated, and sensitivity analyses were performed.

Results: Results are expected in January 2026.

Conclusion: The findings of this study will contribute to a better understanding of how post-stroke movement behaviour relates to long-term cardiovascular outcomes. This understanding may help identify individuals who could benefit most from targeted movement-based secondary prevention.

SO.2.19-02

Navigating Transitions between Physical Activity Initiatives across Health Care and Community Settings: A Qualitative Systematic Review of Barriers and Facilitators

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration

Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Many (ex)patients experience a decline in physical activity or disengage entirely when transitioning between (health)care settings, posing a significant challenge for health care. The aim of the current study was to gain insight into the barriers and facilitators that influence the transition(s) between (or within) health care settings or between health care and the community setting, related to physical activity initiatives for (ex)patients.

Methods: A qualitative systematic review was conducted in line with PRISMA. A systematic search was performed in March 2025 in Medline PubMed, Embase, Cinahl and Web of Science. Keywords of the search strategy included: (ex)patients, (care)transitions, physical activity initiatives and barriers and facilitators. Studies were included if they reported barriers or facilitators of physical activity engagement when transitioning across settings. Transitions could take place between or within health care settings or between health care and community settings. We conducted a qualitative data synthesis guided by the COM-B model to categorise the data.

Results: In total 102 articles were included. Earliest studies date back to around 2000, with a notable increase in publications over the last five years. Studies covered diverse populations, such as individuals with cancer, cardiovascular disease, and stroke, and addressed various physical activity approaches, including referral schemes, local exercise programs, and rehabilitation initiatives. Various facilitators were identified, including support by peers, patients' knowledge of physical activity initiatives, and guidance by health care professionals. Common barriers included lack of transportation, financial constraints, and side effects of treatments and diseases such as fatigue or pain.

Conclusion: This review synthesises a growing body of literature addressing transitions related to physical activity promotion initiatives for (ex)patients across various (health)care and community settings. Findings reveal that

SHORT ORALS

successful transitions are influenced by a complex interplay of facilitators, such as peer and professional support, and patient awareness of physical activity initiatives. Barriers included transportation issues, treatment side effects, and financial constraints. Targeting these factors is essential in order to effectively maintain and promote higher physical activity levels of (ex)patients between and within health care settings, and between health care and the community setting.

SO.2.19-03

Exploring the Association of the Peak and End Rule with Variables Associated with Future Physical Activity: A Scoping Review

V. Bastos¹, D. Santos Teixeira¹

¹Universidade Lusófona, Faculdade de Educação Física e Desporto, Lisbon, Portugal

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration
Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: The peak and end rule heuristic postulates that the affective peaks of largest magnitude (i.e., high and low peaks) and the affective response at the end of an experience (i.e., end affect) may influence variables associated with future behavior. Recent studies support the role of this heuristic and of other similar predictors (i.e., Gestalt characteristics of an experience) in the context of physical activity. However, to the best of our knowledge, a literature review that explores these associations in detail has not yet been developed. As such, the objective of this scoping review was to explore the association of the peak and end rule with psychological variables associated with future physical activity (e.g., remembered affect; enjoyment).

Methods: A throughout search was conducted on the PubMed, SPORTDiscus, PsycINFO, ClinicalTrials.gov, and SportRxiv databases for experimental and non-experimental studies where it was possible to identify an association between the peak and end rule or other Gestalt characteristics with variables associated with future physical activity. The PRISMA extension for scoping reviews was followed thoroughly.

Results: Nineteen studies (N = 867; 86% with both sexes represented), published between 2000 and 2025, were qualitatively analyzed. A total of seven Gestalt characteristics were found (i.e., high peak, low peak, end affect, peak-end average, start affect, affective mean, and affective slope), with end affect being identified in every included study. End affect appears to influence remembered (n = 10) and anticipated affect (n = 4), enjoyment (n = 10), intention (n = 4), and habit (n = 1), with a more pleasurable end of an exercise session originating more favorable results in these variables. Additionally, five studies demonstrated the predictive power of at least one Gestalt characteristic for remembered affect, anticipated affect, and enjoyment.

Conclusion: The peak and end rule and other Gestalt characteristics appear to be associated with psychological variables related to future physical activity. Of these, remembered affect, anticipated affect, enjoyment, and intention are among the most identified. Further studies are necessary to better understand these associations and provide additional scientific support for the still-limited body of evidence on this heuristic in the context of physical activity.

SO.2.19-04

Physical Activity Patterns Assessed by Thigh-worn Accelerometer and their Sociodemographic Correlates among Singaporean Adults: Findings from COBRA Study

K. Jin¹, N. Padmapriya¹, M. Chen¹, M. Movia^{1,2}, S. Zheng¹, X.H. Chua¹, S. Tan¹, T. Topothai¹, X. Sim¹, S.M. Edney¹, R.M. van Dam^{1,3}, F. Müller-Riemenschneider^{1,4}

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration
Room 2, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: The Continuous Observations of Behavioral Risk Factors in Asia (COBRA) study aims to characterize free-living sleep, physical activity, sedentary behavior patterns using thigh-worn accelerometers and to identify sociodemographic correlates of guideline adherence in Singaporean adults.

Methods: A total of 1304 adults participated in a 10-day monitoring period with a thigh-worn accelerometer (Axivity AX3, Axivity Ltd.). Raw data were processed with ActiPASS software to classify time spent in sleep, sedentary behaviour (SB), light-intensity physical activity (LPA), and moderate-to-vigorous physical activity (MVPA) and to estimate daily steps. Adherence to guidelines was defined as: ≥ 7 hours sleep/night, ≤ 8 hours SB/day, ≥ 150 minutes/week MVPA, or ≥ 7000 steps/day. Associations with age, gender, ethnicity, education level, income, BMI, and waist circumference were examined using generalized linear models in Python.

Results: Of 1304 participants, 1019 adults (mean age 40.7 ± 14.0 years; 63% female) provided valid accelerometer data. Most were Chinese (63%), university educated (54%), Mean BMI 24.9 kg/m^2 and waist 81.6 cm. On weekdays, participants averaged 284 mins of sleep, 590 mins of SB, 200 mins of LPA, 66 mins of MVPA, and 8561 steps/day. On weekends: participants averaged 319 mins sleep, 599 min sedentary, 225 min LPA, 70 min MVPA, 9263 steps/day. Sleep duration, LPA, MVPA, and steps were higher on weekends (all $p < 0.001$) while SB showed no difference ($p = 0.12$). Adherence to behavioral guidelines was low: 2.42% of participants met the sleep recommendation (≥ 7 h/night), 14.13% met the SB guideline (≤ 8 h/day), and 66.7% achieved the step guideline (≥ 7000 steps/day).

Conclusion: The weekday-weekend differences may reflect Singapore urban, lifestyle, highlighting the workplace as a potential setting to promote LPA and MVPA and reduce SB. Consistently long SB suggests leisure time activities are predominantly sedentary. Two-thirds of participants achieved steps guideline, though adherence to other guidelines was markedly lower. In the future, the prompt might be integrated and multi-behavior.

SO.2.19-05

Within-day Patterns of Self-monitoring Dietary Intake and Weight Loss in Adults with Obesity

K. Ross^{1,2}, A. Brockmann³, M. Shankar⁴, J. Ruiz⁵, Y.-P. Chen⁵, L. Anthony⁵, M. Perri²

¹Wake Forest University School of Medicine, Advocate Aurora Research Institute, Department of Social & Behavioral Sciences, Winston-Salem, United States, ²University of Florida, Clinical and Health Psychology, Gainesville, United States, ³VA St. Louis Health Care System, St. Louis, United States, ⁴University of Florida, Gainesville, United States, ⁵University of Florida, Computer and Information Science and Engineering, Gainesville, United States

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration
Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Participants in behavioral weight-loss programs (BWLPs) are typically encouraged to self-monitor dietary intake each day, preferably throughout the day (i.e., as eating/drinking occurs). Despite theoretical support for the importance of self-monitoring throughout the day, little is known about within-day patterns of self-monitoring and their associations with weight loss. Thus, we aimed to examine these patterns using data from a 16-week BWLP.

Methods: We examined associations between within-day patterns of self-monitoring and weight loss in 449 adults with obesity (mean $\pm$ SD age = 49.5 ± 11.4 years, BMI = $35.7 \pm 4.0 \text{ kg/m}^2$, 83.5% female) who enrolled in the 16-week BWLP. Participants were asked to self-monitor dietary intake daily, preferably throughout the day, using the FatSecret smartphone app; data were automatically downloaded and time-stamped every 15 minutes from the FatSecret server. Weight was measured at baseline and end of intervention using BodyTrace e-scales. T-tests were used to examine differences in self-monitoring between participants who lost $\geq 5\%$ of their baseline weight (a clinically-significant weight loss) versus those who lost $< 5\%$.

Results: Participants lost an average (mean $\pm$ SD) of $6.4 \pm 4.9\%$ of their baseline weight; 61.9% ($n=278$) lost $\geq 5\%$. Overall, participants did not self-monitor dietary intake on 20.8% of 111 possible days, “back-logged” (recording intake ≥ 1 day after consumption) on 29.2% of days, self-monitored at the end of the day on 17.7% of days, self-monitored throughout the day on 30.5% of days, and “pre-logged” (recording intake ≥ 1 day prior to the day of consumption, without later edits) on 1.8% of days. Compared to participants who lost $< 5\%$ of their baseline weight, participants who lost $\geq 5\%$ were significantly less likely to not self-monitor (39.9% versus 9.0% of days, $p < .0001$) and were more likely to self-monitor at the end of the day (19.1% versus 15.3%, $p = .032$), throughout the day (40.0% of days versus 15.1% of days, $p < .0001$), and to pre-log (2.3% versus 1.1% of days, $p = .004$). There was not a significant difference between groups in back-logging (29.6% versus 28.6%, $p = .616$).

Conclusion: Results provide empirical evidence supporting recommendations for individuals to 1) regularly self-monitor and 2) self-monitor dietary intake *throughout* the day versus waiting until the end of the day.

SHORT ORALS

SO.2.19-06

Sample Size Calculations for Movement Behaviour Interventions

D. Dumuid¹, T. Stanford¹, A. Miatke¹

¹University of South Australia, Adelaide, Australia

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration

Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Lifestyle interventions commonly target behaviours that are *compositional*, that is, interdependent variables that must sum to a constant value. For example, exercise interventions to increase physical activity will require reductions in other movement behaviours (e.g., sitting or sleeping). These trade-offs should be appropriately considered *a priori* in experimental design, for example when determining the required sample size to ensure adequate statistical power to detect a meaningful effect. This study describes a method for conducting sample size calculations tailored for compositional data.

Methods: We demonstrate how to empirically determine required sample size for a given power and alpha, specifying effect sizes that account for the outcome's compositional nature. Our target effect is a 15-minute increase in moderate-to-vigorous physical activity (MVPA) at the expense of sedentary behaviour (while holding light physical activity and sleep constant) in the treatment group compared to the control group. The target effect size is incorporated in the isometric log-ratio response variable scale used in compositional data analysis. Statistical power to detect the target effect size is determined using repeated sampling from real data and using multivariate isometric log-ratio response mixed-effects linear models with group (control vs treatment) and time (pre vs post intervention) as fixed effect predictors, and participant random intercepts to account for repeated measures.

Results: We generated simulated datasets with a mean intervention effect of 15 minutes more MVPA at the expense of sedentary time from a previous study. Doing so incorporated properties of the complex longitudinal and dependent time-use variables consistent with real data (e.g., baseline means, trends, and hierarchical variance-covariance structure). 1000 randomly resampled datasets were generated for each of the sample sizes $n = 200$ to 400 (increments of 10) and had the same multivariate response linear mixed model fit to each. The proportion of times the target effect was detected at $\alpha = 0.05$ at each sample size yielded an empirical power curve, that demonstrated 80% power was achieved at $n = 210$ participants, with 1:1 allocation.

Conclusion: Accounting for the co-dependency of movement behaviours in power analyses enhances both methodological rigour and resource efficiency, ultimately strengthening the evidence base for behavioural interventions.

SO.2.19-07

Reallocation of 24-hour Physical Behaviour Composition and Mortality: Exploring Effect Modification by Sleep Characteristics

W. Bian¹, M.N. Ahmadi¹, J.J. Mitchell², R.K. Biswas¹, N.A. Koemel¹, D. Dumuid³, S.F. Chastin⁴, J.M. Blodgett², J.-P. Chaput⁵, M. Hamer², E. Stamatakis¹

¹The University of Sydney, Sydney, Australia, ²UCL, London, United Kingdom, ³University of South Australia, Adelaide, Australia, ⁴Glasgow Caledonian University, Glasgow, United Kingdom, ⁵University of Ottawa, Ottawa, Canada

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration

Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Time compositions spent in physical behaviours (sleep, physical activity, posture) is associated with premature mortality, but the moderating role of sleep remains unclear. To investigate the associations of time reallocations between physical behaviours with all-cause, cardiovascular disease (CVD) and physical activity-related cancer mortality, and the potential effect modification by sleep duration and regularity.

Methods: Population-based prospective cohort study of 58,149 adults from the UK Biobank accelerometry subsample, collected between 2013 and 2016, followed up to 2022. Daily sleep duration, sleep regularity index (SRI), sedentary behaviour (SB), standing, light-intensity (LPA) and moderate-to-vigorous physical activity (MVPA), measured from wrist-worn accelerometers. Participants were categorized based on age-specific sleep duration recommendations, and sample-based sleep regularity index. Associations of behavioural reallocations with all-cause, major CVD, and PA-related cancer mortality were examined using compositional Cox regression.

SHORT ORALS

Results: Over a mean follow-up of 8.0 years, 2,209 mortality events occurred (345 CVD and 997 cancer). Displacing sleep with MVPA was associated with lower all-cause and CVD mortality risk in the whole sample, regardless of sleep duration and regularity. Among participants who meet sleep duration guidelines, reallocating 30 minutes from sleep to standing, LPA or MVPA was favourably associated with all-cause mortality with HRs of 0.86 (95%CI 0.79, 0.93), 0.87 (0.80, 0.95), and 0.80 (0.73, 0.87), respectively. Reallocating 30 minutes from sleep to SB, standing, or LPA was adversely associated with CVD risk (HRs 1.08 (1.02, 1.15), 1.10 (1.01, 1.20), and 1.11 (1.03, 1.20)) among those not meeting guidelines. Beneficial associations of reallocating SB to sleep were evident only amongst short (<7h/day) or regular (SRI>87.8) sleepers.

Conclusion: Sleep duration and regularity may modify the theoretical replacement effects of sleep and other physical behaviours on mortality. Replacing sleep with equivalent amounts of MVPA appears universally protective; however, replacing sleep with lower intensity of activity (LPA and standing) is only protective for those who are already meeting sleep duration guidelines. Health effects of increasing sleep may depend on initial sleep regularity and duration. Future personalised behavioural interventions could be optimised by incorporating baseline sleep characteristics in their design and behavioural targets.

SO.2.19-09

Associations between Food Agency and Dietary Quality, Cooking Frequency, and Fast-food Intake among a Large, National Sample of US Adults

E. Choi¹, J. Wolfson¹

¹Johns Hopkins University, International Health, Baltimore, United States

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration
Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Diet quality in the United States (US) is persistently low and the Dietary Guidelines for Americans recommends cooking meals at home as a key strategy to promote healthy eating. Food agency, one's ability to procure and prepare food given contextual constraints, has been associated with some measures of dietary intake but has not been examined in relation to an overall measure of diet quality nor with fast-food consumption. The objective of this study was to examine how food agency is associated with dietary quality, frequency of cooking dinner at home, and frequency of consuming fast food among adults in the US.

Methods: We conducted a large, national, web-based survey of US adults in November 2023 (N=4,453) using the CloudResearch panel. Food agency was measured using the Cooking and Food Provisioning Action Scale-Short (CAFPAS-short), a newly validated 11-item version of the original CAFPAS. Dietary intake was assessed using the Prime Diet Quality Score-30d (PDQS-30D; 0-126 points). The survey also included cooking frequency (0-7 days in past week), fast-food consumption frequency (0-32 times in past week), and sociodemographic characteristics. Multivariable linear and Poisson regression models adjusted for sociodemographic characteristics were used to estimate the association between food agency and dietary quality, cooking frequency and fast-food consumption frequency.

Results: Higher food agency was associated with better diet quality as measured by PDQS-30D score ($\beta=1.04$, $p<0.001$), greater frequency of cooking dinner (IRR=1.04, $p<0.001$), and lower frequency of consuming fast food (IRR=0.96, $p<0.001$). Compared with the lowest quartile of food agency, being in the highest quartile was associated with better diet quality ($\beta=6.28$, $p<0.001$), greater cooking frequency (IRR=1.27, $p<0.001$) and lower fast-food frequency (IRR=0.74, $p<0.001$). Overall, comparing the highest to lowest quartile of food agency, predicted values were significantly higher for diet quality (Q4: 59.7, Q1: 50.8, $p<0.001$), cooking frequency (Q4: 5.37, Q1: 4.09, $p<0.001$), and fast-food frequency (Q4: 4.74, Q1: 6.83, $p<0.001$).

Conclusion: Food agency is associated with better diet quality, higher cooking frequency and lower fast-food consumption. Utilizing a food agency framework in policies and interventions may be useful to promote greater home cooking and healthier dietary behaviors.

SHORT ORALS

SO.2.19-10

Movement Behaviour Patterns in People with Multiple Sclerosis

W. Hendrickx^{1,2,3}, L.G. Ijntema¹, Y.A.W. Hartman^{1,2,3}, V. Groot, de^{4,5,6}, M.F. Pisters^{1,2,3}

¹Fontys University of Applied Sciences, Department of Health Innovations and Technology, Research Group Empowering Healthy Behavior, Eindhoven, Netherlands, ²University Medical Centre Utrecht, Department of Rehabilitation, Physiotherapy Science & Sport, UMC Utrecht Brain Centre, Utrecht, Netherlands, ³Centre for Physiotherapy Research and Innovation in Primary Care, Julius Health Care Centres, Utrecht, Netherlands, ⁴Amsterdam UMC, Department of Rehabilitation Medicine, Amsterdam, Netherlands, ⁵Amsterdam Neuroscience, Neuroinfection & Inflammation, Amsterdam Movement Sciences, Rehabilitation & Development, Amsterdam, Netherlands, ⁶MS Center Amsterdam, Amsterdam UMC, Amsterdam, Netherlands

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration
Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: High amounts of sedentary behaviour and low levels of physical activity and sleep, separately increase limitations in daily living and reduce the quality of life in people with Multiple Sclerosis (MS). However, these behaviours are not independent and research on the 24-hour movement behaviour patterns as a whole is lacking in this population. This information is needed to determine who would benefit from interventions to support improving their movement behaviour patterns and what factors need to be addressed in such interventions. Therefore, we aim to:

- 1) Identify the 24-hour movement profiles in people with MS.
- 2) Determine the association between the 24-hour movement profiles and limitations in daily living, quality of life and the risk of cardiovascular disease.
- 3) Determine what factors (demographic, MS related and behavioural) are associated with the 24-hour movement profiles.

Methods: An observational study is being conducted including at least 200 community dwelling people with MS who are able to walk independently. 24-Hour movement behaviour is objectively measured using an accelerometer for 7 consecutive days, capturing short sedentary bouts (<30 min), prolonged sedentary bouts (≥30 min), light physical activity, moderate-to-vigorous physical activity and sleep. Compositional data analysis using isometric log-ratio transformations will be used for principal component analysis, followed by k-means clustering to identify separate groups of 24-hour movement behaviour profiles. The optimal number of clusters will be determined using the Calinski-Harabasz index. To determine the relationship between the 24-hour movement behaviour patterns and limitations in daily living, quality of life and the risk of cardiovascular disease, multinomial logistic regression analyses will be performed using the movement behaviour patterns, a.k.a. clusters, as the outcome variable. The same analysis will be used to determine the association between the movement behaviour profiles and demographic, MS and behavioural related factors (e.g. fatigue, self-efficacy and views regarding physical activity).

Results: The results will be available early 2026.

Conclusion: We anticipate that insights into movement behaviour patterns and the associated factors will reveal valuable information to develop behavioural interventions to support people with MS to improve their movement behaviour and thereby reduce the impact of MS on daily life.

SO.2.19-12

Strength or Steps? Acceptability of a Two-arm Workday Intervention to Improve Strength and Glycemic Control in 2-minute Bouts

J. Moore¹, C. Mayer², M. Baiocchi³, M. Oppezzo¹

¹Stanford University, Stanford Prevention Research Center, Palo Alto, United States, ²Stanford University, Genetics, Palo Alto, United States, ³Stanford University, Epidemiology and Population Health, Palo Alto, United States

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration
Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Many jobs are sedentary characterized by prolonged periods of sitting. The detrimental effects of prolonged sitting can be reversed through short bouts of movement, such as walking. Emerging evidence suggests that short bouts of strength training may not only reverse these effects but also confer additional physiological benefits. This

SHORT ORALS

randomized controlled pilot study seeks to compare two types of movement breaks (walking and strength training) on muscular strength and glycemic control among sedentary working adults.

Methods: This study uses a parallel-group, two-arm randomized controlled design. We recruit 80 sedentary adults to receive a progressive strength training program (n=40) or a walking breaks program (n=40) consisting of four two-minute breaks per workday. The study includes a 2-week baseline, 8-week intervention, and 4-week follow-up. The intervention period includes weekly Zoom check-ins, automated self-monitoring surveys, weekly tailored feedback, and peer-modeled strength training videos for the strength group. The primary outcome is feasibility and acceptability of the program, and we also explore efficacy for muscular strength and glycemic control. Muscular strength is assessed at 3 timepoints (baseline, mid-intervention, and post-intervention) by asking participants to perform repeated movements until failure. Glycemic control is assessed at baseline and post-intervention using continuous glucose monitors (CGMs) and HbA1C blood tests. We also interview participants at the conclusion of the study to assess barriers and facilitators to engaging in short bouts of physical activity during the workday.

Results: The study is currently recruiting participants for a final cohort. 64 participants have enrolled, and 54 have completed the study. Final results are anticipated in 2026.

Conclusion: Current recommendations for sedentary behavior focus on stretching, walking, and seated movements. No studies have examined an equipment-free, short bout strength training program in real-world settings. Findings will inform a fully-powered trial, with an extended study duration.

SO.2.19-13

The Development of a Multi-component Intervention to Improve 24-hour Movement Behaviours in People with Multiple Long-term Conditions and Carers: An Intervention Mapping Approach

L. Wilde¹, M. Thomas², L. Herring¹, L. Gray³, S. Greenwood⁴, M. Hadjiconstantinou^{5,2}, J. Hawkins⁶, A. Sayer^{7,8}, K. Khunti^{1,2}, J. Sargeant⁵, M. Davies^{1,2}, T. Yates², H.M. Young^{1,2}

SO.2.19 Motivation and behavior change: Interrupting Sedentary Time and Movement Integration

Room 2, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: The aim of this study was to develop a theory and evidence-based intervention to improve 24-hour movement behaviours (physical activity, sedentary behaviour and sleep) in people living with multiple long-term conditions (MLTCs) and frailty, and their informal carers.

Methods: Intervention Mapping (IM) was used to develop the intervention. A literature search, Patient and Public Involvement groups (n=16 people with MLTCs and frailty, and n=8 carers), and Focus Group Discussions (FGDs) with 22 carers and 31 Healthcare professionals informed the needs assessment step of IM. The most important determinants were identified from behaviour change theory, and performance and change objectives formulated. Behaviour Change Techniques (BCTs) and their applications were specified in a matrix of change, and the programme plan formulated. FGD data were analysed using reflexive thematic analysis.

Results: The IM steps specified the behavioural and environmental outcomes, performance objectives and determinants to improve 24-hour movement behaviours of people with MLTCs and frailty and their carers. Determinants included knowledge, self-efficacy, skills, outcome expectations, motivation and perceived behavioural control. Key BCTs included goal setting, action planning, problem solving, information about health consequences, instructions on how to improve 24-hour movement behaviours, feedback, self-monitoring, reviewing goals, and social support. The resulting intervention includes seven one-to-one sessions and bi-weekly telephone calls over six months. Shared Decision Making around 24-hour movement behaviours is facilitated by a personal decision aid and a digital tool (MyHealthMapp) which uses wearable data and integrated patient-reported outcomes to inform these conversations. Subsequent personalised goals and action plans are supported by Steps4Health, a digital tool which provides personalised step goals, tracking, and guided exercise features. Both tools have been adapted and refined for the target populations. At month 3, individuals are referred to a Physical Activity Officer to support attendance at a community-based group or activity within their local community.

Conclusion: The IM process facilitated the systematic and transparent integration of theoretical frameworks, empirical

SHORT ORALS

evidence, and stakeholder perspectives. A mixed-methods feasibility randomised controlled trial will evaluate the feasibility and acceptability of the intervention and a future definitive trial.

SO.2.20-09

Scaling up a Physical Activity Program for Older Adults: Findings from a Project at the Municipality Level

S. Kohler¹, T. Fleuren², H. Ziemainz¹, K. Abu-Omar¹

¹Friedrich-Alexander-Universität Erlangen-Nürnberg, Department of Sport Science and Sport, Erlangen, Germany,

²Staatliches Gesundheitsamt Erlangen-Höchststadt, Erlangen, Germany

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality

Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Physical activity (PA) represents a central protective factor in dementia prevention. Building on this evidence, the GESTALT – Get 10 project aims to scale up a PA program within municipal prevention practice. The PA program targets older adults who are inactive or engage in very little PA, and combines different forms of exercise with social and cognitive approaches. Results of the scaling up and implementation of the PA program in ten municipalities in Bavaria (Germany) from 2020 to 2024 are presented below.

Methods: Using a participatory approach with researchers and local authorities, the evidence-based GESTALT-PA program was systematically introduced and made accessible to stakeholders in ten participating communities. Local scaling up was primarily overseen by the project-specific municipal coordinators, who acted as a bridge for knowledge integration, resource management, and program delivery. The implementation of the PA program was carried out by exercise instructors specifically trained for this purpose. Using standardized questionnaires, which were completed by the municipal coordinators directly after the funding phase and analysed by the research team, the program's scaling and implementation were evaluated.

Results: Over the course of the project the GESTALT-PA program was scaled up in all ten municipalities. Specifically, 45 GESTALT-PA programs (initial courses) and 44 follow-up programs were implemented. In addition, 23 new PA initiatives, such as walking groups, were established across the ten participating municipalities. Overall, 74 exercise instructors were educated to implement the GESTALT-PA program, also five supervisors were additionally qualified to educate future instructors. Six months after funding was secured, the GESTALT-PA program continued in all ten municipalities, albeit at different levels.

Conclusion: Through the targeted provision and GESTALT-PA program-specific qualification of local exercise instructors, the effective implementation of the program across all ten municipalities was achieved. At the same time, this successful implementation also indicates that the scaling of the PA program in the planned region has been effectively accomplished. Further research is warranted to examine whether and how the transfer of the program to neighbouring municipalities can be effectively achieved and sustained in practice.

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality

Room 3, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: To establish the effect of physical activity (PA) and sedentary behaviour (SB) interventions in people living with frailty and multiple long-term conditions (MLTCs) on physical function, QoL, PA and body composition.

Methods: Systematic review and meta-analysis (PROSPERO: CRD42024501164). Ten databases were searched (2000-October 2025). Randomised controlled trials (RCTs) evaluating PA or SB interventions in people with MLTCs (≥ 2 long-term conditions) and frailty were included. Evidence synthesis used a random-effects meta-analysis. Certainty of evidence was assessed using GRADE. Risk of bias (ROB) was assessed using the Cochrane Collaboration's tool (v2).

Results: Thirty RCTs were included. The majority ($n=29$, 97%) focused on PA; all were structured exercise programmes, three (10%) included a walking component. One study (3%) addressed SB.

21 studies ($n=1812$) measuring physical function were appropriate for meta-analysis. Eleven studies included in meta-analysis had unclear overall RoB, nine high RoB and one low RoB. There was a significant pooled effect (SMD= 0.78, 95% CI: 0.54 to 1.02 $p \leq 0.05$) favouring intervention. There was considerable statistical heterogeneity ($I^2 = 81.22\%$) and low certainty of evidence.

Six studies ($n=750$) which measured QoL were appropriate for meta-analysis. Four studies had unclear overall RoB and two had high RoB. There was a significant pooled effect (SMD= 0.31, 95% CI: 0.04 to 0.59, $p \leq 0.05$) favouring intervention. Statistical heterogeneity was considerable ($I^2 = 66.66$) and there was very low certainty of evidence.

There was low certainty evidence PA interventions were associated with improvements in PA ($k=3$, $n=506$, SMD 0.73, 95%CI 0.40 to 1.06, $p < 0.001$). For body composition, there was very low certainty evidence of a reduction in fat mass ($k=4$, $n=149$, MD -1.94 kg, 95%CI -3.68 to -0.10, $p=0.03$), but no impact on lean, fat-free or muscle mass (very low certainty evidence).

Conclusion: Physical activity interventions led to improvements in QoL, physical function and PA in people living with MLTCs and frailty compared to usual care. They also reduced fat mass but had no other effects on body composition. Further high-quality trials are indicated given the low certainty of the evidence. This should include SB interventions, which may be more accessible for those with high treatment and symptom burden.

SO.2.20-02

Food Insecurity, Cooking and Food Behaviours and Confidence in Changing Food Behaviours Amid the Cost-of-Living Crisis on the Island of Ireland: Nationally Representative Cross-sectional Study

Z. Bell¹, M. Renard¹, A. McCloat², E. Mooney², L. Hollywood³, F. Lavelle¹

¹King's College London, London, United Kingdom, ²Atlantic Technological University, Sligo, Ireland, ³Ulster University, Belfast, United Kingdom

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality

Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: The cost-of-living crisis is having significant impacts on household budgets, forcing spending adaptations, but, there is little understanding of how individuals are adapting their food and cooking behaviours. This study aimed to assess consumers' cooking and food-related behaviours (e.g., food purchasing and storage), levels of food insecurity, and their confidence in changing these behaviours during the cost-of-living crisis.

Methods: A nationally representative cross-sectional online survey of adults (≥ 18 years old) living on the island of Ireland conducted between March and April 2025. Participants were eligible if they prepared a meal in the kitchen at least once every two weeks and/or had primary or shared responsibility for household food shopping. Data were collected on demographics, food insecurity, cooking skills, food behaviours, food engagement, confidence in changing food behaviours, mental wellbeing and diet quality, using validated measures where available. Data analysis used chi-square tests, Kruskal-Wallis H tests, and hierarchical multiple regression with adjustment for relevant covariates ($p < 0.05$) in IBM SPSS version 29.

Results: Of 1006 adults (51% female, mean age 44.1 years, SD 15.6), 30.3% had low (20.0%) or very low (10.3%) food security. Participants from Republic of Ireland were more likely to be food insecure than food secure ($p < .05$). Females, low-income households, below university level education and non-white ethnic groups were overrepresented in food insecure groups. Engagement in food-related behaviours was significantly lower in food secure groups ($p < .001$). However, no significant differences were found in cooking skills confidence, behaviour change confidence or fruit and vegetable intake. Mental wellbeing was positively associated with food security, behaviour change confidence, and total food engagement score (adjusted $R^2 = 0.204$).

Conclusion: Food insecurity on the island of Ireland was common, disproportionately affected disadvantaged groups, and linked to poorer wellbeing. Food-insecure adults reported similar cooking confidence and behaviour-change

SHORT ORALS

levels to food-secure peers but higher food engagement and lower wellbeing. Food security, food engagement, and behaviour-change confidence were independently associated with better wellbeing, suggesting that material support and opportunities to engage positively with food may help protect mental health in food-insecure households. Cooking and food skills programmes could help and should be explored alongside measures addressing economic hardship.

SO.2.20-03

Nutrition Security and Hemoglobin A1c among Adults with Type 2 Diabetes at Risk of Food Insecurity: Baseline Findings from the LINK Trial

K. Garrity¹, J. Garner¹, K. Sonnevile¹, S. Smith², D. Walker³, J. Joseph⁴

¹University of Michigan, Nutritional Sciences, Ann Arbor, United States, ²University of Michigan, Health Management and Policy, Ann Arbor, United States, ³Ohio State University, Department of Family and Community Medicine, Columbus, United States, ⁴Ohio State University, Division of Endocrinology, Diabetes, and Metabolism, Department of Internal Medicine, Columbus, United States

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality
Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Food insecurity affects 13.5% of U.S. households and disproportionately impacts marginalized groups. It is associated with elevated hemoglobin A1c (HbA1c) and greater chronic disease risk through mechanisms related to access and intake of health-promoting foods. Nutrition security was introduced to address limitations in food security metrics, including the lack of diet quality and health equity indicators. However, this concept remains conceptually and empirically underdeveloped, and few studies have examined its relationship with clinical biomarkers relevant to chronic disease management. This analysis examined whether nutrition security, measured via a validated survey, was associated with glycemic control (HbA1c) among adults with food insecurity and uncontrolled Type 2 diabetes (T2D) participating in a pragmatic trial addressing food and nutrition security.

Methods: We analyzed baseline cross-sectional data from 247 participants enrolled in the LINK randomized controlled trial through healthcare clinics in a Midwestern city in the U.S. Eligibility criteria included age ≥ 18 years, T2D diagnosis, HbA1c $\geq 7.5\%$, and a positive screen for food insecurity. Nutrition security was assessed using the Household Nutrition Security Scale (HNSS) and categorized as low or high. Linear regression models tested associations between nutrition security and HbA1c. Parallel models tested food security, diet quality, and health-related social needs, all assessed via validated measures.

Results: Participants were primarily female (68%) and Black (64%), with a mean age of 53 years and mean HbA1c of 9.3% (SD=1.9). Half reported low nutrition security, and 75% reported food insecurity. In adjusted models (n=240), nutrition security was not significantly associated with HbA1c ($\beta=-0.08$, 95% CI: -0.58, 0.42; $p=0.76$). Food security, diet quality, and social needs similarly showed no significant associations. Older age was associated with lower HbA1c.

Conclusion: Nutrition security and food security were not associated with glycemic control at baseline. Non-overlap between these constructs supports their conceptual distinction. Findings underscore the need for ongoing refinement of nutrition security measures and greater conceptual clarity regarding how food security and nutrition security interrelate. Longitudinal analyses within intervention contexts like LINK are needed to clarify potential pathways through which these constructs may influence diabetes outcomes.

SO.2.20-04

Pre-requisite Physical Function to Increase Steps/Day from a Walking Intervention for Adults with Arthritis

D. White¹, S. Wilcox², S. Jamieson², K. Horn², C. Pellegrini²

¹University of Delaware, Newark, United States, ²University of South Carolina, Columbia, United States

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality
Room 3, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: We explored the relation of baseline self-reported physical function with changes in steps/day and incidence of walking >6,000 steps/day over 6 weeks following the Walk with Ease (WWE) physical activity intervention in adults with arthritis.

Methods: We conducted a secondary analysis of a trial of adults with doctor-diagnosed arthritis randomized to either a 6-week WWE telephone-delivered intervention or a waitlist control. Physical function difficulty was determined based on self-reported difficulty on any of the following Health Assessment Questionnaire items: limitation with walking, climbing 5 steps, and rising from a chair. Steps/day were measured using an ActiGraph GT9x Link worn on the waist over 7 days (> 10hr/day). Study outcomes included change in steps/day from baseline to 6 weeks and incidence of walking >6,000 steps/day (previously found to protect against developing functional limitation) at 6 weeks among participants walking <6,000 steps/day at baseline. We examined where study outcomes were predicted by the following categorical exposure variable based on limitation and randomized condition: 1) Control with limitation, 2) WWE with limitation, 3) Control without limitation and 4) WWE without limitation. Difference scores, risk ratios (RR), and 95% confidence intervals (CI) were used in separate models.

Results: A total of 266 adults with arthritis (64.1±9.4 years, 92% women, BMI 34.2±7.7 kg/m²) were included (n=131 in WWE, n=135 in control). At baseline, 47 (17.7%) participants walked >6,000 steps/day. WWE participants who reported any difficulty with rising from a chair had 777 fewer steps/day (95% CI [-1607, 51]) over 6 weeks and were 87% less likely (RR 0.13 95% CI [0.02, 0.91]) to walk >6,000 steps/day compared to those in the WWE group without difficulty with rising from a chair. There were no differences for changes in steps/day or incidence of walking >6,000 steps/day for difficulty walking or climbing 5 steps.

Conclusion: The ability to rise from a chair without difficulty may be an important functional pre-requisite for adults with arthritis to increase physical activity. Future studies should examine whether targeting sit-to-stand impairments prior to physical activity could help to increase overall long-term physical activity levels in adults with arthritis.

SO.2.20-05

Association between Physical Activity Bout Duration and Physical Functioning in Older Adults: A Longitudinal Cohort Study

L. Karavirta¹, M. Hyvärinen¹, A. Löppönen¹, T. Aittokoski¹, S. Brage², T. Gonzales², T. Rantanen¹

¹University of Jyväskylä, Gerontology Research Center and Faculty of Sport and Health Sciences, Jyväskylä, Finland,

²MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality

Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Moderate-to-vigorous physical activity (MVPA) is often quantified by summing all movement that exceeds a certain absolute intensity threshold. However, the duration of activity bouts is a key component of aerobic activity, especially when intensity is defined relative to aerobic capacity. We examined the independent association between bouts MVPA and functional capacity over a four-year follow-up in older adults. We hypothesise that the activity bout duration is independently associated with maintaining functioning only when intensity is quantified in relative terms.

Methods: The participants (n=295) were community-dwelling men and women aged 75–85 years. MVPA was assessed using a thigh-worn accelerometer. The absolute threshold was set at acceleration equivalent to 3 METs (10.5 ml/kg/min). The relative threshold was individually determined based on the intensity of a six-minute walk test. Functional capacity was measured at baseline and after four years using the six-minute walking distance and the time to complete a five times sit-to-stand test (STS). Traditional and compositional linear regression analyses were used to study the associations for total MVPA and bouts vs. nonbouts MVPA, respectively. Models were adjusted for age, sex, BMI, follow-up time, and total physical activity.

Results: At baseline, walking distance was 432 (75) meters and STS time 12.1 (3.6) seconds. During follow-up, walking distance decreased by 51 (46) meters and STS time increased by 1.0 (4.3) seconds. The associations of bouts vs. nonbouts MVPA using 30-second to 30-minute bout requirement were not significant with walking distance or STS when using either absolute or relative threshold. Only total MVPA using relative ($\beta=0.27$, $p=0.004$) but not absolute (-0.06 , $p=0.643$) threshold was associated with the change in walking distance during the follow-up. Total MVPA was not associated with the change in STS time.

Conclusion: The duration of activity bouts was not independently associated with functional capacity. The total amount of activity at sufficient intensity relative to individual capacity appears to be a more important factor than bout duration for maintaining functional capacity in older age.

SHORT ORALS

SO.2.20-06

E-ACTIVE AGING: An Exergame-based and Multicomponent Exercise Program for Community-dwelling Older Adults at Risk of FallingP. Lillo-Urzuá^{1,2}, J. Ugarte Llanten², I. Cigarroa², M. Cuenca-García¹¹Universidad de Cádiz, Department of Physical Education, Faculty of Education Sciences, School of Education., Cadiz, Spain, ²Universidad Católica Silva Henríquez, Facultad de Ciencias de la Salud, Escuela de Kinesiología, Santiago, Chile

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality

Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: To evaluate the effectiveness of a supervised exergame-based multicomponent intervention compared with a traditional multicomponent training program in community-dwelling older adults at risk of falling.**Methods:** A randomized controlled trial with parallel groups and blinded assessment was conducted among older adults (≥ 60 years) attending National service for the elderly (SENAMA) day centers in Santiago, Chile. Fifty-two participants were randomly allocated to either an exergame plus multicomponent exercise group (EE+ME, $n=26$) or a traditional multicomponent exercise group (ME, $n=26$). Both groups completed supervised sessions twice weekly for 12 weeks, based on the multicomponent program and ACSM guidelines. The outcomes included fall risk (Downton Fall Risk Index), dynamic and static balance (Timed Up and Go and Single-Leg Stance), body composition (InBody® 270) and upper and lower limb strength (grip strength test and five-repetition sit-to-stand test). All analyses were performed with SPSS v.26 considering $p < 0.05$ and GraphPad Prism v8. Study adhered to CONSORT and SPIRIT guidelines and was approved by the Universidad Santo Tomás Ethics Committee (N°238-MZS, November 2024). Trial registration: ClinicalTrials.gov ID NCT07024004.**Results:** A significant time effect was found for Timed Up and Go ($p=0.002$, $\eta^2 = 0.010$), single-leg stance on both sides ($p < 0.001$, $\eta^2 = 0.046-0.047$), and Five-Times Sit-to-Stand ($p=0.008$, $\eta^2 = 0.047$) indicating improved dynamic and static balance and lower-limb function. No significant time effect was observed for handgrip strength ($p=0.138$, $\eta^2 = 0.004$). A group effect emerged for fat mass percentage ($p < 0.001$, $\eta^2 = 0.071$), favoring the EE+ME group, while total lean mass showed a small non-significant trend ($p=0.083$, $\eta^2 = 0.066$). No significant interaction effects (time $\times$ group) were detected in all outcomes, suggesting similar improvements across interventions.**Conclusion:** Both interventions produced significant improvements in functional performance, dynamic and static balance, and lower-limb strength over time, confirming the effectiveness of multicomponent exercise for fall-risk reduction in older adults. Although no significant interaction effects were found, small effect sizes favored the Exergame+Multicomponent group, suggesting that integrating exergames may provide comparable or slightly greater benefits while maintaining motivation and adherence among community-dwelling older adults.

SO.2.20-07

Maintaining Function and Participation through 24-hour Movement Behaviours for People with Multiple Long-term Conditions and Frailty (PERSONAL-AGILITY Study): Protocol for a Randomised Controlled Feasibility TrialV. Hall¹, M. Thomas², L. Wilde¹, L. Herring¹, M. Davies², M. Hamza², P. Sarkar², A. Harris³, G. Laura², S. Greenwood⁴, M. Hadjiconstantinou², J. Hawkins⁵, K. Khunti², M. Maddocks⁶, A. Sayer⁷, A. Rowlands², S. Seidu², T. Yates², H. Young²¹University Hospitals of Leicester NHS Trust, Leicester Diabetes Centre, Leicester, United Kingdom, ²University of Leicester, Leicester, United Kingdom, ³Active Together, Leicestershire County Council, Leicester, United Kingdom, ⁴King's College Hospital NHS Trust, London, United Kingdom, ⁵Cardiff University, Centre for Development, Evaluation, Complexity and Implementation in Public Health Improvement (DECIPHER), School of Social Sciences, Cardiff, United Kingdom, ⁶Kings College London, Cicely Saunders Institute of Palliative Care, Policy & Rehabilitation, London, United Kingdom, ⁷Newcastle University and Newcastle upon Tyne Hospitals NHS Foundation Trust, Newcastle, United Kingdom

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality

Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: The PERSONAL-AGILITY study will determine the feasibility of a randomised controlled trial (RCT) and explore the acceptability of a theory- and evidence-informed 24-hour movement behaviour (physical activity,

SHORT ORALS

sedentary behaviour, and sleep) intervention in people with multiple long-term conditions (MLTCs) and frailty, and their informal carers.

Methods: A mixed-methods feasibility RCT with an embedded process evaluation (ISRCTN14362764, 25/11/2024). Fifty participants with MLTCs and frailty (+carers) will be recruited and randomised 2:1 to intervention or usual care. Primary outcomes include eligibility, recruitment, retention, and outcome completion rates assessed against *a priori* progression criteria. Secondary outcomes include body composition, blood pressure, accelerometer-assessed 24-hour behaviours, physical function, and patient-reported outcomes (goal attainment, quality of life, participation, symptoms, carer burden) assessed at baseline, 12, and 24 weeks.

Implementation will be explored via fidelity assessments, dose (adherence data) and reach (demographics, completion and engagement data). Potential mechanisms of impact will be explored using secondary outcome data alongside interviews. The influence of context will be explored using site profiles alongside interview data.

Quantitative and qualitative data will be analysed separately before being integrated. Quantitative data will be analysed using descriptive statistics and 95% confidence intervals and qualitative data using reflexive thematic analysis. Data sets will be integrated using joint display.

Results: The study commenced in June 2025. As of November 2025, of the $n=50$ people who expressed an interest in the study, $n=32$ (70%) were eligible, and $n=16$ (50%) consented to participate ($n=2$ with carers). To date, $n=8$ people with MLTCs and frailty have been randomised (five intervention, three usual care).

Conclusion: Twenty-four-hour movement behaviours are increasingly recognised as a key component of holistic and person-centred healthcare. The intervention aligns with the NHS Long Term Plan and NICE guidance on multimorbidity, supporting integration into care pathways. Carer involvement and integration with community services provides continuity of support, improved engagement, and coordination of care. The PERSONAL-AGILITY study is the first to evaluate the acceptability of a 24-hour movement intervention in people living with MLTCs and frailty, and the feasibility of a future RCT evaluating clinical and cost-effectiveness. Results will help refine trial design, intervention components and delivery.

SO.2.20-08

Scaling Up Community-based Dance Classes for Healthy Ageing and Fall Prevention: Pilot Trial Outcomes and Recommendations

H. Gilchrist¹, A. Haynes¹, C. Sherrington¹, L. Hassett¹, M. Pinheiro¹, K. Owen², D. Merom³, A. Tiedemann¹

¹University of Sydney, Institute for Musculoskeletal Health, Sydney School of Public Health and Sydney Local Health District, Camperdown, Australia, ²University of Sydney, Prevention Research Collaboration, Sydney School of Public Health, Camperdown, Australia, ³Western Sydney University, School of Science and Health, Campbelltown, Australia

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality

Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Evidence-based exercise programs that improve balance and strength can reduce fall risk in older adults but are often unpopular. Tailored dance programs may offer an enjoyable alternative. Our previous evaluation of popular community-based tailored dance classes developed a program theory explaining high participation and sustained attendance, but their effectiveness for fall prevention remains untested. This pilot trial assessed the acceptability and feasibility of a tailored dance intervention and identified program and implementation features to inform future trials.

Methods: We conducted a randomised waitlist-controlled pilot delivering a 10-week, twice-weekly dance program to community-dwelling adults aged 65+. The intervention incorporated meaningful music, narrative, imagery, modifications for accessibility, and a relational teaching approach delivered by experience dance teachers. Participants completed pre- and post-intervention surveys and functional assessments; a sub-sample participated in semi-structured interviews. Primary outcome: program acceptability; secondary outcomes: feasibility, social networks, mental health, quality of life, dance and balance self-efficacy, physical activity, falls, physical function, and memory.

Results: Acceptability was high: 98% of participants ($n=56$) would recommend the program to others like them; 91% wished to continue; 95% endorsed study procedures. Feasibility was demonstrated: recruitment took 12 weeks; 47% of all expressions of interest ($n=139$) were screened, enrolled, and randomised ($n=63$). Retention was 90% ($n=57$), and average class attendance was 86%, with all attending $\geq 70\%$ of sessions. Intervention participants showed significant improvement in dance self-efficacy ($p<0.01$); no other quantitative changes were detected. Qualitative interviews ($n=19$ participants, 4 instructors) confirmed and extended program theory, highlighting mechanisms such as physical

SHORT ORALS

and mental benefits, enhanced self-esteem, camaraderie, and emotional uplift. New insights addressed scalability: building trust in unfamiliar communities, adapting for diverse abilities, training instructors from varied dance backgrounds, and managing venue and life circumstance challenges.

Conclusion: The pilot demonstrated strong acceptability, feasibility and safety, confirming tailored dance programs can be delivered at scale with high engagement. Findings support further evaluation in a larger trial with falls as the primary outcome. If effective, tailored dance programs could provide an accessible, enjoyable and sustainable strategy for fall prevention and wellbeing in older adults.

SO.2.20-10

PROWELL: The Impact of Increased Protein Intake and Physical Activity on Markers of Well-being in Postmenopausal Women

J. Baum¹, S. Attu¹, S. Boudrey¹, K. Santos¹, L. Kamman-Cummings²

¹University of Arkansas System Division of Agriculture, Center for Human Nutrition, Food Science, Fayetteville, United States, ²University of Arkansas System Division of Agriculture, Center for Human Nutrition, Cell and Molecular Biology, Fayetteville, United States

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality
Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Nutrition plays an essential role in the health, function, and wellbeing of older adults. Nutritional strategies can mitigate the development of sarcopenia, physical impairment, and poor wellbeing. Several studies have identified dietary protein as a key supportive nutrient for skeletal muscle health in middle-aged and older adults. In addition to the proposed benefits on skeletal muscle, optimal protein intake can help maintain energy balance, reduce cardiometabolic risk, and promote overall wellbeing. The objective of this study is to determine the effects of consuming a higher protein diet with or without regular physical activity for 16 weeks on wellbeing in postmenopausal women.

Methods: Postmenopausal women aged 50 years and older (at least 12 months since last menstrual cycle) who regularly participate in physical activity (e.g., 2-4 bouts of physical activity per week) are being recruited to participate in the study. The study is a parallel design with participants randomized to one of three arms 1) control group (current n=15) which maintains protein consumption at 0.8 g protein /kg body weight or less and limit red meat consumption for 16 weeks, 2) higher protein diet (n=16; 1.6 g protein/kg body weight); and 3) a higher protein diet (n=16) 1.6 g protein/kg body weight in combination with 150 minutes of physical activity, including strength training 3 times per week. Markers of well-being are assessed at 0, 4, 8, 12, and 16 weeks. Sleep quality and duration is assessed via an ActiGraph triaxial wrist accelerometer GT9X Link, and subjective sleep quality is assessed using the Pittsburgh Sleep Quality Index (PSQI). The Profile of Mood States (POMS) questionnaire is being used to assess mood.

Results: Preliminary analysis suggests protein intake improves markers of sleep (global sleep score) and mood (total mood disturbances) over 16 weeks and addition of physical activity further improves these measures, compared to the control group. These changes were accompanied by a decrease in android fat in postmenopausal consuming protein, independent of physical activity.

Conclusion: Increasing dietary protein intake to 1.6 g protein/kg body weight may improve wellbeing through better sleep and improvements in mood in postmenopausal women. NCT06849817

SO.2.20-11

A Pilot Randomized Controlled Trial of an Automated Online Exercise Program after Knee Replacement

C. Pellegrini¹, S. Jamieson¹, K. Horn¹, C.-H. Yang¹, H. Prine¹, J. Lee¹, J. Unick², C. Kennerley¹, E. Regan¹

¹University of South Carolina, Exercise Science, Columbia, United States, ²Brown Health, Providence, United States

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality
Room 3, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: The purpose of this pilot randomized controlled trial was to examine the acceptability and preliminary efficacy and maintenance effects of a fully automated, online physical activity (PA) intervention for adults ≥ 1 year post-knee replacement (TKR).

Methods: Fifty older adults (80% female, 68.0 ± 6.8 years, 6.1 ± 5.1 years post-TKR) from 23 U.S. states were randomized to begin a 3-month intervention immediately (Energize!) or after 3 months (Delayed Energize!). The online program provided PA goals, progressing from 75 to 200 min/week, along with weekly behavioral video lessons and homework assignments. Participants planned and recorded their weekly PA on the website and received weekly automated, personalized feedback based on goal attainment and reported any barriers. Acceptability was assessed through program adherence, retention rates, and a 7-point Likert participant satisfaction and program usefulness survey. Repeated measures ANOVA assessed changes in ActiGraph-measured PA (Moderate-to-vigorous intensity PA [MVPA] min/week, steps/day) and patient-reported outcomes (pain intensity/interference, cognitive function, sleep disturbance) across time and between groups at 3 months. Paired samples t-test were used to examine the maintenance effects from 3-6 months for the Energize! group.

Results: Energize! participants' adherence was as follows: video lessons viewed (93.4%), exercise plans submitted (87.3%), exercise reported (89.4%), and homework completed (74.6%). Retention was greater in Energize! (70.4%) vs. Delayed Energize! (95.6%; $p=0.02$). Energize! participants reported high satisfaction with the program (5.8 ± 1.6) and rated the program features for planning (5.7 ± 1.5), and reporting PA (5.5 ± 1.3) to be the most useful. At 3 months, Energize! participants had greater increases in PA (MVPA: 70.39 ± 73.66 min/week, $p < 0.001$; steps/day: 1224.58 ± 1251.82 , $p < 0.005$) compared to Delayed Energize! (MVPA: -7.71 ± 25.77 min/week; steps/day: -70.49 ± 1134.14), but changes were not sustained at 6 months. No changes in patient-reported outcomes were observed across time or between groups.

Conclusion: A fully automated online PA program was well received by adults with TKR and produced short-term increases in PA. Future studies should identify strategies that could be added to the fully automated program to support long-term changes in PA.

SO.2.20-12

Cognitive Benefits of an Intergenerational Cognitive-physical Activity Program in Adults with Mild Cognitive Impairment: Findings from the *Brain in Motion* Study

J. Latomme¹, T. Van Langenhove², S. Stegen¹, M. Miatton², G. Cardon¹

¹Ghent University, Movement and Sports Sciences, Ghent, Belgium, ²Ghent University Hospital, Ghent, Belgium

SO.2.20 Ageing: Clinical Interventions, Frailty, and Physical Functionality
Room 3, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Dementia poses one of the most pressing public health challenges worldwide, and multicomponent interventions combining physical, cognitive, and social stimulation are crucial to strengthen cognitive reserve in people with Mild Cognitive Impairment (MCI), a key stage for prevention. The *Brain in Motion* study examined whether a 12-week intergenerational cognitive-physical activity program, grounded in the Ronnie Gardiner Method (RGM®); a rhythm- and music-based approach combining movement, coordination, and cognitive challenge; could enhance cognitive, physical, and psychosocial health in adults with MCI. The program engaged dyads of MCI participants and their adult son/daughter, who joined weekly RGM-based group sessions complemented by home-based exercises and motivational interviewing. The present analysis focuses on cognitive outcomes in adults with MCI.

Methods: A quasi-experimental pretest-posttest control group design was used, including 19 adults with MCI (IG=14, CG=5; mean age= 70.0 ± 6.0 years; 42.1% female). Cognitive outcomes were assessed at baseline and post-intervention using the CANTAB neuropsychological test battery. Primary outcomes included associative learning (Paired Associates Learning, PAL), delayed visual recognition memory (Delayed Matching to Sample, DMS), and executive functioning (Multitasking Test, MTT). Linear mixed models (intention-to-treat), adjusted for age and sex and using cluster-robust SE's, were applied to examine Group $\times$ Time effects.

Results: A significant Group $\times$ Time interaction was found for delayed visual recognition accuracy (DMSPCADZScore: $\beta=1.39 \pm 0.66$, $p=0.05$), indicating that the intervention group improved in recognition memory, whereas the control group remained stable. For associative learning (PALMETS: $\beta=0.47 \pm 0.21$, $p=0.04$), both groups showed improvements in learning efficiency (fewer errors post-intervention), with a slightly steeper decline in errors in controls, likely reflecting small-sample variability. Other cognitive domains (executive functioning and processing speed) showed positive but non-significant trends in both groups.

Conclusion: This study provides preliminary evidence that a 12-week intergenerational RGM-based cognitive-

SHORT ORALS

physical activity program can support learning and memory performance in individuals with MCI. The observed improvements in visual recognition memory highlight the promise of socially engaging, rhythm- and music-based cognitive-physical stimulation for supporting brain health in early cognitive decline. However, given the small sample size, particularly in the control group, further research is needed to confirm these findings and clarify effects on other cognitive domains.

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Considering the central role of smartphones in adolescents' daily routines, dietary mobile health (mHealth) apps (i.e., apps that provide education about dietary habits and tracking of these behaviors) are a window of opportunity to intervene on dietary habits. Despite many studies that have examined the effects of mHealth apps on dietary habits, few have explored adolescent perspectives and experiences of using these apps. We aimed to synthesize the evidence and map the research gaps on adolescents' perspectives (positive or negative) and experiences (attitudes, barriers, and facilitators) of using dietary mHealth apps on their smartphones.

Methods: We conducted a scoping review of published literature in PsycINFO, Embase, Medline, Web of Science and CINAHL. Mixed-methods studies were included and focused on adolescents (10-19 years of age) reporting perspectives (positive or negative) and experiences (attitudes, barriers, and facilitators) of using dietary apps. Two independent reviewers performed title, abstract and full-text screening using Covidence software. A third reviewer led a thematic analysis to identify overarching themes detailing adolescents' experiences with dietary apps.

Results: Out of 590 abstracts reviewed, 17 studies met the eligibility criteria. Ten studies tested the usability, feasibility and acceptability of a standalone or multi-component dietary mHealth app, while nine evaluated the likability and effectiveness of dietary apps. Positively perceived features included general food identification, food tracking and game features, although inaccurate food identification and game repetitiveness were negatively perceived. Commonly discussed barriers were technical difficulties, tracking inaccuracies, complicated delivery of information and lack of social engagement. Facilitators to app participation included ease of use, targeted delivery of information, social engagement, rewards and personal goal setting. Suggestions for app improvement pertained to tracking, interface and design improvements, information and feedback provision, and notification options. Finally, adolescents considered effective apps to increase eating habit awareness, and improve perceived dietary intake.

Conclusion: This scoping review explored adolescents' positive and negative perspectives, and experiences using dietary mHealth apps. Understanding these perceptions are crucial to inform the development of more positive and engaging experiences using dietary standalone or multi-component mHealth apps aimed to promote healthy nutrition habits.

Goldman School of Dental Medicine, Department of Health Policy & Health Services Research, Boston, United States

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: In the first known weight management trial using text messaging among low-income public housing residents, we tested whether a combined mobile health and Community Health Worker-delivered counseling intervention (mHealth+CHW) demonstrated improved weight loss efficacy compared to an mHealth only intervention (mHealth only) and an assessment-only group (control).

Methods: English- and Spanish-speaking adults with overweight/obesity (BMI $\geq$ 27.0), recruited from 17 U.S. urban public housing developments in Boston Massachusetts, were randomized 1:1:1 to mHealth+CHW, mHealth only, or control groups. The mHealth intervention was a 12-month interactive, theory-based text messaging intervention and a cellular-connected scale for self-weighing; the CHW counseling intervention was 12 monthly telephone calls focused on diet and physical activity using motivational interviewing. The primary outcome was objectively measured weight; secondary outcomes were diet (via 24-hour recalls) and physical activity (via accelerometry), each collected at baseline, 6-, and 12-month follow-up. Between-group analyses were conducted to examine 6-month outcomes using ANOVAs.

Results: Participants (n=286) mean age was 53.7 (range=18-87 years). The majority were female (85.0%), Hispanic (71.7%), and had $\leq$ high school education (63.9%). Assessment completion was $>80\%$ across groups. Mean (SD) weight change was -2.86 (12.94), -2.85 (9.57), and -1.86 (8.94) pounds, in the mHealth+CHW, mHealth only, and control groups respectively (not statistically significant). For diet behaviors, mean changes were 0.12 (1.74), -0.16 (1.98), -0.13 (2.25) cups of fruits and vegetables; 0.06 (16.37), -2.90 (15.46), and 1.15 (15.68) grams of solid fat; and -0.51 (6.18), -0.47 (6.70), and 0.47 (5.45) teaspoons of added sugars, in the mHealth+CHW, mHealth only, and control groups respectively (not statistically significant). Minutes of moderate/vigorous physical activity were not significantly different between groups. Intervention engagement data was: text message response rate=50.9%; number (SD) of self-weighing readings/participant mean=79.2 (130.3); and number (SD) of completed CHW counseling calls/participant mean=6.4 (3.5).

Conclusion: The combination of mHealth with CHW counseling was well accepted by public housing residents and showed beneficial changes at 6-month follow up in weight and related diet behaviors (increased fruits and vegetables and reduced sugar consumption). Results provide promising support for implementation of technology-based interventions supplemented with personalized culturally relevant support from CHWs to public housing populations facing multiple health disparities.

SO.2.21-05

Enhancing Shared Decision Making Regarding 24-hour Movement Behaviours between People with Multiple-long-Term Conditions and Healthcare Professionals: A Qualitative Think-aloud Study of the MyhealthMapp mHealth Tool

M. Thomas¹, H. Young², L. Wilde³, M. Davies¹, L. Gray¹, S. Greenwood⁴, M. Hadjiconstantinou¹, J. Hawkins⁵, A. Sayer⁶, T. Yates¹, L. Herring³

¹University of Leicester, College of Life Sciences, Leicester, United Kingdom, ²University of Leicester, Diabetes Research Centre, Leicester, United Kingdom, ³University Hospitals of Leicester, Leicester Diabetes Centre, Leicester, United Kingdom, ⁴Kings College Hospital, London, United Kingdom, ⁵Cardiff University, School of Social Sciences, Cardiff, United Kingdom, ⁶Newcastle University, Faculty of Medical Sciences, Newcastle upon Tyne, United Kingdom

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Physical inactivity amongst people with multiple long-term conditions (MLTCs) increases the risk of poor outcomes such as frailty. Considering the full spectrum of 24-hour movement behaviours (sleep, sitting, stepping,

SHORT ORALS

sweating, and strengthening) offers more opportunities to improve activity levels and health. MyHealthMapp is an mHealth tool designed to support shared decision-making (SDM) between healthcare professionals and patients by providing red-amber-green ratings of their 24-hour movement behaviours (from wearable devices) and health outcomes to set personalised goals. This study aimed to identify potential refinements to MyHealthMapp for people with MLTCs.

Methods: People with MLTCs were recruited through the Leicester Diabetes Centre volunteer database and university hospital networks. Of 75 respondents, 20 were eligible and consented to participate. Participants completed one think-aloud interview while using *MyHealthMapp*, followed by a semi-structured interview. Transcripts were analysed using think-aloud and framework thematic analysis. Subsequently, findings were mapped to the APEASE (Acceptability, Practicability, Effectiveness, Affordability, Side-effects, Equity) and MoSCoW (Must-have, Should-have, Could-have, Won't have) frameworks to inform refinements.

Results: Participants (mean age 67 years; range 39-89; 11 males) were predominately White British (n=10) or South Asian (n=8), with one of Tanzanian and one of Irish ethnicity. Frailty levels ranged from Clinical Frail Scale (CFS) <4 (n=10) to CFS 4-7 (n=10). Three key themes were identified:

1. **Usefulness:** Participants perceived MyHealthMapp as valuable for real world use, particularly in supporting meaningful conversations with Healthcare Professionals, e.g., "It's got a lot of information there that can be useful."
2. **Understanding:** Participants found medical jargon, abbreviations, and RAG ratings confusing, e.g., "I don't know what the red signifies."
3. **Usability:** Participants were able to navigate MyHealthMapp with ease; however certain content was overlooked due to design, e.g., "There should be an instruction to hover over the dots."

Conclusion: MyHealthMapp shows potential to enhance SDM and support positive change in 24-hour movement behaviours among people with MLTCs. Feedback has guided refinements to MyHealthMapp, including clearer language, enhanced visual design, and improved user guidance. MyHealthMapp is being evaluated for feasibility and acceptability within an intervention (Personal-Agility) to support SDM and improve 24-hour movement behaviours in people with MLTCs and frailty.

SO.2.21-06

Acceptability of the Foodbot Factory Digital Curriculum-based Nutrition Education Intervention among Elementary School Children

J.M. Brown¹, K. Jefferson¹, S. Tahir¹, B. Franco-Arellano¹, A. LeSage², J. Hughes², B. Kapralos³, W. Lou⁴, E. Vogel¹, M. Farkouh⁵, C. Tugault-Lafleur⁶, J. Arcand¹

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: To test the hypothesis that a digital, game-based nutrition education intervention (Foodbot Factory) is more acceptable to children than a traditional educational intervention (control).

Methods: A parallel cluster-randomized controlled trial was conducted among Grade 4 and 4/5 (ages 8-11) classrooms in Ontario, Canada. Classrooms were eligible if they had not covered the nutrition curriculum and were randomized in a 1:1 allocation ratio to: 1) an intervention group using the Foodbot Factory intervention; or 2) a control group using conventional materials. Classrooms in both groups received five daily nutrition education lessons (35-40 minutes/day). Both interventions were iteratively co-designed with teachers and dietitians. Lessons were provided by a teacher on the research team. Intervention acceptability was assessed using an 11-item questionnaire (5-point Likert scales) based on the Theoretical Framework of Acceptability. A blinded outcome assessor collected data. A logistic regression model assessed the agreement for each acceptability item, accounting for clustering.

Results: 32 classrooms were randomized to the intervention (n=16 classrooms; n=286 participants) and control groups (n=16 classrooms; n=287 participants). Internal consistency for the acceptability scale was moderate (Cronbach's $\alpha=0.76$). Overall, acceptability was high in both groups, with agreement ranging from 78.7% to 90.2% (intervention) and 72.4% to 86.4% (control). However, all items had higher agreement in the intervention group. Participants in the intervention group were significantly more likely to agree that the intervention was fun (87.4% vs. 76.0%, $p=0.0062$).

SHORT ORALS

and that the goals were clear (86.0% vs. 78.7%, $p=0.046$). Other items demonstrated meaningful differences in acceptability, including higher agreement that using Foodbot Factory was a positive experience (84.3% vs. 77.6%, $p=0.069$) and higher self-reported learning about food and nutrition (90.2% vs. 83.3%, $p=0.056$). Participants in both groups agreed that learning about nutrition is important (89.5% vs. 86.4%, $p=0.27$) and that the interventions did not cause stress about eating behaviours (81.1% vs. 78.0%, $p=0.37$).

Conclusion: Foodbot Factory was more acceptable than control, suggesting that digital classroom-based interventions are well-received by children. The control intervention also had high acceptability, highlighting the importance of intervention design and teacher training for nutrition education. Registration: [clinicaltrials.gov](https://clinicaltrials.gov/ct2/show/study/NCT05979259) registration NCT05979259 Funding: CIHR (186097).

SO.2.21-07

Effectiveness of a Text Message-delivered Behavioural Weight Management Intervention for Postpartum Women with Overweight or Obesity on Diet and Physical Activity: The Supporting MumS RCT

D. Gallagher¹, E. Spyrelli¹, A. S Anderson², S. Bridges³, C. R Cardwell¹, E. Coulman⁴, S. U Dombrowski⁵, C. Free⁶, S. Heaney¹, P. Hoddinott⁷, F. Kee¹, C. McDowell⁸, E. McIntosh⁹, J. V Woodside¹, M. C McKinley¹, on behalf of the Supporting MumS Study Team

¹Queen's University Belfast, Centre for Public Health, Belfast, United Kingdom, ²Ninewells Medical School, Centre for Research into Cancer Prevention and Screening, Dundee, United Kingdom, ³Bradford Institute for Health Research, Bradford, United Kingdom, ⁴Cardiff University, Centre for Trials Research, Cardiff, United Kingdom, ⁵University of New Brunswick, Faculty of Kinesiology, Fredericton, Canada, ⁶London School of Hygiene & Tropical Medicine, Public Health Interventions Unit, London, United Kingdom, ⁷University of Stirling, Centre for Healthcare and Community Research, Stirling, United Kingdom, ⁸Northern Ireland Clinical Trials Unit, Belfast, United Kingdom, ⁹University of Glasgow Institute of Health and Wellbeing, Health Economics and Health Technology Assessment, Glasgow, United Kingdom

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Effective and cost-effective behavioural weight management interventions in the postpartum period are lacking. The Supporting MumS (SMS) trial tested the effectiveness of an automated, text message-delivered intervention, promoting self-directed diet and physical activity behaviour change using behaviour change techniques, to support postpartum weight loss. This work examines the effect of the intervention on secondary diet and physical activity outcomes at 6 and 12 months.

Methods: Participants were women, between 6 weeks and two years postpartum, with a BMI ≥ 25 kg/m², from across the United Kingdom. The 2-arm, multi-centre, parallel group RCT randomised women to receive 12 months of text messages about weight management (intervention group) or child health and development (active control). We assessed the effectiveness of the intervention on diet (mean scores for Fat and Fibre Barometer (FFB) and intake of commonly consumed sugary foods) and physical activity (mean MET minutes/per week and high/low/moderate physical activity levels according to IPAQ- SF). Outcomes collected by self-report questionnaires at baseline, 6- and 12-months follow-up were compared between groups. Analysis was intention to treat using ANCOVA for continuous variables and logistic regression for ordinal variables, adjusting for baseline values, site, ethnicity and recruitment pathway.

Results: Of the 892 women recruited (445 intervention; 447 active control), 868 (97.3%), 733 (93.9%) and 658 (95.1%) completed questionnaires at the baseline, 6 month and 12-month timepoints, respectively. Statistically significant between groups differences showed improved FFB scores (adjusted mean difference 0.09 [0.04, 0.14], $p<0.001$), increased MET minutes/week (adjusted mean difference 417.2 [154.2, 680.1], $p=0.002$) and increased odds of having higher physical activity levels (OR 1.55 [1.14, 2.10], $p=0.01$), for the intervention group at 12 months. The same trends were observed at 6 months follow-up with exception of intake of sugary foods which showed a statistically significant reduction in the intervention group at 6 months (adjusted mean difference -0.10 [-0.20, -0.01], $p=0.04$) which was not maintained at 12 months.

Conclusion: A novel, fully automated text message-delivered behavioural weight management intervention supported modest improvements in diet and physical activity behaviours in a diverse sample of UK postpartum women with overweight or obesity.

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: This review synthesizes the engagement strategies and evaluation metrics applied in research trials of nutrition apps designed for adults, aiming to promote dietary behavior change and prevent chronic diseases.

Methods: We conducted a systematic search of PubMed, Scopus, Cochrane and Web of Science for relevant studies from January 1, 2013, to June 2024. Our inclusion and exclusion criteria followed the PICOS framework.

Results: Our searches retrieved 4,045 records and after exclusion of duplications, abstract screening and full-text review, 59 studies were included. The majority of these apps focused on adults with overweight and obesity and underwent (non-) randomized controlled trials, with varying durations (1 week to 18 months) and sample sizes (majority recruited 50-200 participants). Engagement was typically measured by frequency of specific function use and frequency of app usage right, followed by retention rate. The two most common engagement strategies reported in studies were push notifications (49%) and behavioral theory elements (41%). The lack of consistent definitions of user engagement limited comparison across studies and made it difficult to interpret the use and impact of engagement strategies. The majority of research examined short- to medium-term engagement patterns although this limited the understanding of long-term behavior change.

Conclusion: Our findings suggest that adaptive user-centered design together with standardized engagement metrics should be implemented to enhance nutrition app effectiveness.

SO.2.21-10

The Right Push at the Right Time: Exploring How Socioeconomic and Personal Factors Shape Nudge Effectiveness across Different Just-in-Time Nudges

N. Swart¹, L. Janssen¹, T. van Leeuwen¹, S. Soedamah-Muthu¹, N. van der Laan¹

¹Tilburg University, Tilburg, Netherlands

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Poor diets are a significant risk factor for chronic diseases, which disproportionately affect individuals with lower socioeconomic positions (SEP). As food purchasing increasingly moves online, digital platforms offer opportunities to promote healthier eating through timely and personalised nudges. It remains unclear which factors should guide personalisation and how to design effective just-in-time (JIT) nudges, timely choice-architecture modifications presented at the point of decision-making. This study investigates how SEP and individual traits influence the effectiveness of four digital JIT nudge types, examining moderating effects of SEP, decision-making styles (GDMS), and food choice motives (FCM), and mediating effects of reactance and ease of identifying healthier options.

Methods: A preregistered online experiment (OSF.IO/TRF4V) with a one-factor, five-level between-subjects design was conducted among 600 Dutch adults. Participants completed a grocery shopping task using MAND, a realistic mock supermarket app developed for research purposes. They were randomly assigned to one of five app conditions: no nudge, JIT visibility-only, descriptive nutritional label (DNL), hedonic enhancement, or social norm. When selecting an unhealthy product, participants saw a pop-up recommending a healthier alternative. Afterwards, they completed questionnaires. Primary outcomes were nudge effectiveness (percentage of healthier recommendations accepted) and basket healthiness (mean nutritional score of final purchases). Planned analyses include two conceptual models:

1. *JIT Nudge Presence Model:* testing effects of JIT visibility (vs. no nudge) mediated by reactance and

SHORT ORALS

identification ease and moderated by SEP, GDMS, and FCM.

2. *JIT Nudge Type Model*: comparing DNL, hedonic, and social-norm nudges (vs. JIT visibility) with the same moderators and mediators as above.

Results: Data collection will conclude by week 48 of 2025. We expect JIT visibility nudges to increase healthier choices compared to no nudge. DNL nudges are hypothesised to be most effective among higher-educated or health-oriented participants, hedonic nudges among intuitive or taste-driven individuals, and social-norm nudges among lower-SEP participants. There are additional preregistered hypotheses on the moderating and mediating effects mentioned above.

Conclusion: This study clarifies how SEP and individual traits interact with digital message design to influence healthier food choices. Identifying these personalisation parameters will inform the development of equitable and adaptive digital nudging interventions that encourage healthier diets.

SO.2.21-11

Effect of a Multimedia Messaging Intervention on Promoting Healthy Eating Among Amazonian Children

A.C. Hovadick¹, C. Zani¹, I. Giacomini¹, L. Faggiani¹, A.A. Damasceno², V. Maciel², B. Lourenço¹, M. Cardoso¹

¹University of Sao Paulo/ School of Public Health, Nutrition, Sao Paulo, Brazil, ²Federal University of Acre, Center for Health Sciences, Cruzeiro do Sul, Brazil

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: This study evaluated the efficacy of a behavioral intervention delivered via mHealth in supporting healthy linear growth and improving dietary patterns among school-age children living in the Brazilian Amazon. It addressed the urgent need for scalable, low-cost strategies to promote child nutrition and growth equity in remote regions.

Methods: A single-blind randomized controlled trial was conducted with 266 caregivers of children aged 7–8 years from a birth cohort in the Brazilian Amazon. Participants were recruited via telephone and social media in June 2023 and randomly assigned to receive 19 weeks of multimedia behavioral mHealth messages (intervention) or usual care (control). Messages were cross-culturally adapted to the Amazonian context (Hovadick, 2025). The primary outcome was the change in BMI-for-age z-score, with height and weight measured according to WHO standards. The secondary outcome was dietary intake, assessed using a Food Frequency Questionnaire validated for the Western Amazon population. Analyses followed both intention-to-treat (ITT) and per-protocol (PP) approaches and were stratified by sex. Within-group (intragroup) changes were assessed using paired t-tests, and between-group (intergroup) differences were evaluated using independent t-tests (Stata 18.0; $P < 0.05$).

Results: In the ITT analysis, BMI-for-age significantly decreased within the control group (-0.10 ; 95% CI: -0.17 , -0.03), particularly among boys, while no significant intragroup change occurred in the intervention group. The intergroup difference was not statistically significant. In the PP analysis, boys in the control group showed a greater intragroup reduction, resulting in a significant intergroup difference (-0.25 ; 95% CI: -0.50 , -0.01), suggesting inadequate weight gain relative to linear growth. Regarding diet, no statistically significant intergroup differences were observed for any food or food group. However, both ITT and PP analyses revealed significant intragroup reductions in the consumption of ultra-processed foods, added fats, and added sugars in both groups, with more pronounced improvements in the intervention arm.

Conclusion: This mHealth behavioral intervention effectively supported adequate growth and promoted healthier eating patterns among Amazonian children. The convergence of favorable intragroup trends in the intervention group highlights its clinical and public health relevance and reinforces its potential for scalable, equitable nutrition promotion in low-resource settings.

SHORT ORALS

SO.2.21-12

Navigating a Cancer Journey at Work: An Elearning Intervention to Improve Breast Cancer Patients' Disclosure Practices

G. Brannon¹, W. Casper², S. Jones³, Y. Liao⁴

¹University of Texas at Arlington, Communication, Arlington, United States, ²University of Texas at Arlington, Management, Arlington, United States, ³Fred Hutch Cancer Center, Cancer Prevention Program Public Health Sciences Division, Seattle, United States, ⁴University of Texas at Arlington, Kinesiology, Arlington, United States

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Managing a cancer diagnosis while employed adds significant distress to existing health challenges, prompting calls for supportive workplace interventions. Strategies reducing stigma and fostering chronic illness support may enhance participation in workplace or community programs targeting nutrition and physical activity (PA), thus advancing behavioral health practices. Advances in eLearning offer scalable, tailored options; this pilot study evaluates the feasibility and acceptability of three eLearning modules on workplace disclosure with supervisors, human resources personnel, and peers.

Methods: Breast cancer survivors completed a pre-survey, three weekly eLearning modules (each with a post-module survey), and a final survey; those who finished all modules were invited to an optional exit interview about their experience. Guided by the Disclosure Decision Making Model, the modules featured studio-produced videos created by research faculty and a patient advocate, with theoretically-informed scripts. Videos showcased women diverse in race, ethnicity, age, and career background.

Results: 58 women completed the pre-survey; 25 women completed the post-survey. The participants had a mean age of 33.91 years old. Participants reported ($p < .05$) that the intervention was usable ($M=4.60$), convenient ($M=4.40$), relevant ($M=4.80$), and valuable ($M=4.40$). Post-intervention breast cancer self-management self-efficacy was higher ($M=4.39$, $SD=.50$) than pre-intervention self-efficacy ($M=4.04$, $SD=.44$). We also assessed cancer knowledge, perceived cancer stigma, work-related social support, and disclosure decision making constructs. Qualitatively, participants reported wishing they experienced this intervention earlier and would use the strategies they learned in the future.

Conclusion: Employment changes often lead to financial hardship for cancer survivors; scalable interventions like eLearning modules can help mitigate this challenge. Preliminary mixed-methods data indicate that these modules are feasible, acceptable, and effective in improving workplace communication self-efficacy and reducing apprehension, thereby enhancing survivors' experiences at work. The format is adaptable for behavioral nutrition and PA interventions, supporting engagement with wellness resources and counseling through effective disclosure and advocacy. Increased self-management self-efficacy suggests eLearning can be extended to other domains, such as diet and exercise, where self-efficacy drives behavior change and sustained participation. This pilot demonstrates the potential of brief, user-centered eLearning tools to advance psychoeducational intervention methodology, informing integrative programs that combine communication with nutrition or PA modules for cancer survivors.

SO.2.21-13

Feasibility of a Citizen Science Approach to Tracking Dietary Behaviors among Adolescents

M.F. Roca Rubio¹, S. Spolander¹, H. Wieslander¹, V. Papapanagiotou¹, I. Ioakeimidis¹

¹Karolinska Institutet, Department of Medicine, Huddinge, Stockholm, Sweden

SO.2.21 E- & mHealth: Digital Tools for Dietary Behavior Change

Room 4, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: This pilot study, part of the multinational EU project PREVENT, aimed to evaluate a novel dietary monitoring approach using a citizen science model, where adolescents actively contributed to data collection to assess the overall healthfulness of students' diets.

Methods: Over one week, students were invited to participate in a behavioral monitoring action in their school through an information session and via QR-codes for self-registration in the study. After providing digital consent and completing an onboarding questionnaire, participants used a purpose-built mobile app to provide self-rated data and capture photos of all consumed fruits, meals, drinks, and snacks, including GPS and timestamp metadata.

SHORT ORALS

Demographic and image annotation data were merged for analysis. Manual researcher food-type annotations and self-reported sleep data were summarized at the participant level. K-means clustering was applied to identify dietary behavior patterns, while drink categories were clustered separately. Associations between food and drink clusters were tested using chi-square analysis, and ANOVA and Pearson correlation were used to explore relationships between sleep and dietary patterns.

Results: Sixty-two participants (mean age =16.8±1.18years; 44 women) uploaded 689 images (mean =10.8 per participant). Clustering revealed three main dietary patterns:

- Cluster1 (n=33): Higher intake of nutritious meals/snacks, lower junk food; average sleep =8.55hrs.
- Cluster2 (n=18): Moderate intake of ultra-processed foods other than junk food or sweet/savory snacks, plus a mix of healthy and less healthy items; average sleep =8.66 hrs.
- Cluster3 (n=11): High intake of junk food and sweet/savory snacks; average sleep =8.01hrs.

Drink clustering revealed three beverage profiles.

Chi-square analysis indicated a significant association between food and drink clusters ($\chi^2=9.55, df=4, p=0.049$).

ANOVA showed no significant sleep differences across food clusters ($p=0.34$).

Pearson correlation suggested a weak, non-significant negative association between junk food intake and sleep hours ($r=-0.23, p=0.09$).

Conclusion: This pilot demonstrates the feasibility of citizen science for adolescent dietary monitoring. Linked food and beverage patterns were identified, while sleep showed limited association. Analysis is ongoing, with planned regression models to examine parental education as a predictor of dietary patterns, addressing socio-economic influences and informing targeted interventions. Future work will also leverage GPS and timestamp metadata to explore spatial and temporal eating patterns within school environments.

Art-based Methods in Co-creation with Children in an Asylum Seeker Centre: Lessons Learned from the B-challenged Project

R. Wink^{1,2}, T. Altenburg^{1,2}, D. Vonk³, T. Saal³, M. Colijn^{1,4}, M. Chin A Paw^{1,5}, L. Klaufus^{1,2,6}

¹Amsterdam University Medical Centers, Public and Occupational Health, Amsterdam, Netherlands, ²Amsterdam Public Health Research Institute, Health Behaviors and Chronic Diseases, Amsterdam, Netherlands, ³De Vrolijkheid Foundation, Amsterdam, Netherlands, ⁴University of Amsterdam, Faculty of Social and Behavioural Sciences, Amsterdam, Netherlands, ⁵Amsterdam Public Health research institute, Health Behaviors and Chronic Diseases, Amsterdam, Netherlands, ⁶Amsterdam Public Health Research Institute, Methodology, Amsterdam, Netherlands

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Co-creation is increasingly used as a method to tackle complex research problems and is an effective tool to improve child empowerment. Children living in asylum seeker centres are often not involved co-creation. However, child empowerment is of great importance for these children, as it increases their resilience and gives them a voice in research. Including these children in co-creation activities can be challenging due to language barriers and because children frequently move away mid-project. As part of the larger European B-Challenged project, this project integrated art-based methods into co-creation to involve children living in an asylum seeker centre in the research process, with the purpose of making the co-creation process more accessible to this population of children.

Methods: Twenty-three participatory sessions took place at an asylum seeker centre in Amsterdam with a dynamic group of children aged 7-12 years. Sessions were facilitated together with an artist working for the Dutch foundation 'De Vrolijkheid' and an academic researcher. The overall goal of the sessions was to identify how art-based methods can aid the co-creation process when certain barriers (e.g. language, dynamic group of children) are in place. The co-creation process focused on obtaining children's perceptions on design criteria for developing a playground to improve children's physical activity. After each session, facilitators filled in reflection forms and session logbooks. These data were analysed using thematic analysis.

Results: Preliminary results show that art-based methods can aid the co-creation process especially when language barriers are in place. In traditional co-creation sessions language plays a substantial role in the process, for example in group discussions or plenary explanations of activities. By using art-based methods, the role of language is minimized, as children can express themselves through creating objects and plenary explanations are limited by showing physical examples. Concurrently, facilitators need to make sure activities are short and specific to keep them

SHORT ORALS

interesting to the children and making sure the appropriate research output is created.

Conclusion: This presentation provides insight in how art-based methods can be integrated into the co-creation process for children, especially to minimize the impact of possible language barriers on the process.

SO.2.22-02

Participatory Health Promotion Research with Youth in Vulnerable Positions: The Case of Practical Education Students in the Netherlands

D. van Uden¹, A. Wagemakers¹, M. Peeters², M. Kleinjan³, K. Verkooijen¹

¹Wageningen University & Research, Health and Society Group, Wageningen, Netherlands, ²Utrecht University, Youth Studies, Utrecht, Netherlands, ³HAN University of Applied Sciences, Organisation of Healthcare and Services, Nijmegen, Netherlands

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Participatory research holds promise for health promotion program design with youth. However, youth in more vulnerable positions are currently underrepresented. Addressing this gap is important, as youth empowerment - one of the main benefits of participatory research - can be particularly valuable for these youth. Therefore, this research aims to gain insight into how participatory health promotion research with young people in vulnerable positions can be conducted in ways that are genuinely empowering.

Methods: The research was conducted in the context of the Healthy Lifestyle for Low Literate Teenagers (LIFTS) project, which aims to support a healthy lifestyle among practical education (PrO) students in the Netherlands. We used qualitative methods (interviews, participant observation and diaries) to reflect on the participatory research process with 179 students, seventeen school staff members, and three researchers at three PrO schools. The six-element framework for actualizing youth empowerment in participatory health promotion research (Chrifou et al., 2024) was used as an analytical lens.

Results: The results show that an environment that enables youth empowerment in the PrO context consists of several important elements: a safe and welcoming environment, the involvement of PrO staff, a flexible and inclusive research design, fun in the process, and increased knowledge and awareness of health behaviors.

Conclusion: As youth in vulnerable positions are still underrepresented in participatory research, the results of this study can contribute to knowledge in this field and inspire future researchers. This in turn will hopefully contribute to better health promotion programs for youth in vulnerable positions and more health equity.

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: To engage Spanish-speaking adults in the translation and adaptation of a physical activity (PA) support program for adults with overweight/obesity, we explored perspectives of four, Self-Determination Theory-based PA messages that support autonomy and intrinsic motivation.

Methods: We recruited Spanish-speaking adults to participate in a 120-minute virtual focus group. Adults (≥ 18 years) were included if they had a BMI ≥ 25 kg/m² and self-reported exercising < 150 minutes/week. The focus group was audio-recorded and transcribed verbatim. A team-based approach was used to conduct a content analysis using ATLAS.ti software to explore perceptions around four messages: 1) "All movement counts. Find opportunities to move throughout the day", 2) "Move in ways that feel good and/or that you enjoy. Benefits of PA include improved mood, sleep, less anxiety, more patience", 3) "You are a mover – By moving more, movement can become part of your identity" and 4) "Movement as self-care. By moving more, you are taking better care of yourself."

Results: Twenty adults (age: 42.7 (range 27-71 years); BMI: 32 (range 25-46 kg/m²); 30% male; 75% Hispanic, 25% Latino; 95% born outside of United States, 5% unknown) participated. Participants identified with all messages and found them acceptable and motivating. Qualitative categories specific to each message are outlined below. First message categories: a) exemplars of putting this message in action (e.g. parking further away, lifting/carrying a child), b) self-awareness of message helped participants "count" activities they previously didn't count (e.g., cleaning), and c) a misconception that occupational labor doesn't count. Second message categories: a) participants agreed with the benefits PA can bring, b) if exercise is fun (e.g., dancing), it is more motivating, and c) a desire to educate the community with this message. Third message categories: a) participants linked identity with how others see them and discussed social stigma around obesity. Fourth message categories included a desire to refine the message by a) more clearly linking self-care to better health (physical and mental), b) indicating that self-care should be a daily practice, c) adding "physical" in front of movement, and d) incorporating healthy nutrition.

Conclusion: Perspectives indicated high acceptability and opportunities for refinement.

SO.2.22-04

Effects of a Physically Active Learning Lesson on Daily and School-time Physical Activity in Secondary School Students

M. González-Pérez^{1,2}, F. Martín-Acosta^{1,2}, F.J. Bandera-Campos^{1,2}, A. Ruiz-Hermosa^{3,4}, D. Camiletti-Moirón^{1,2}, D. Sánchez-Oliva^{2,5}

¹University of Cadiz, Department of Physical Education, Faculty of Education Sciences, Puerto Real, Spain, ²Instituto de Investigación e Innovación Biomédica de Cádiz (INIBICA), Cádiz, Spain, ³University of Castilla-La Mancha, Social and Health Care Research Center, Cuenca, Spain, ⁴University of Castilla-La Mancha, Faculty of Education, Ciudad Real, Spain, ⁵University of Extremadura, Department of Musical, Visual and Physical Expression Teaching, Cáceres, Spain

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: To analyze the effect of a physically active learning (PAL) lesson on daily physical activity (PA) levels and during school hours in secondary school students, by comparing a day with and without the implementation of a PAL lesson.

Methods: One hundred and four 7th and 8th grade students (12–14 years old) from two Spanish secondary schools were randomly assigned to the PAL intervention group. This intervention involved a weekly PAL mathematics lesson for 16-weeks. PA and sedentary time were recorded for seven full days using an Actigraph GT3X+ accelerometer, which was placed on the participants' non-dominant wrist. Measurements were taken prior to the intervention and during the last week of the intervention. A total of 50 participants with valid accelerometer data were included in the study. Two analyses of variance (ANOVA) for one (group)*two (times) were performed to analyze the effect of a PAL lesson on PA levels during the full-day and during school hours on the day of its implementation.

Results: The data were expressed as the average total daily and school-time minutes, as well as percentages relative to wear-time and total school time. Results for **full-day PA**, expressed in total minutes, showed an increase in sedentary time, light PA and moderate-to-vigorous PA (MVPA) on the day the PAL lesson was implemented. However, expressed as a percentage, they showed a slight reduction in sedentary time and light PA, as well as an increase in MVPA. In none of the cases the differences were statistically significant ($p > 0.05$). Focusing on **school-hours PA**, the data showed the same trend when expressed in minutes or as a percentage: a reduction in sedentary time and an increase in light PA, with statistically significant increases in MVPA ($p = 0.003$, $\eta^2 = 0.181$; $p = 0.002$, $\eta^2 = 0.185$, respectively) on the day the PAL lesson was implemented compared to days when it was not.

SHORT ORALS

Conclusion: Although the effect of a PAL lesson on full-day PA levels appears to be insufficient on the day it is implemented, it has the potential to significantly increase PA during school-hours on that same day. This may be due to methodological, contextual or individual factors.

SO.2.22-06

Promoting Healthy Diet and Movement Behaviours in UK Preschoolers: Evidence-based Co-production of Health Promotion Materials

K. Hesketh¹, R. Kipping², R. Lakshman³, A. Porter², C. Summerbell⁴, E. van Sluijs⁵

¹University College London, London, United Kingdom, ²University of Bristol, Bristol, United Kingdom, ³Peterborough County Council, Peterborough, United Kingdom, ⁴Durham University, Durham, United Kingdom, ⁵University of Cambridge, Cambridge, United Kingdom

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Overweight/Obesity remains a concern for preschool-aged children (0-5-year-olds). To support action in practice, we synthesised systematic review evidence assessing determinants of dietary and movement health behaviours in 0-6-year-olds to inform the co-development and co-production of health promotion materials to support UK preschoolers' healthy weight.

Methods: Three phases of work were undertaken. In Phase 1, review-level evidence was synthesised for dietary (i.e. fruit and vegetable, obesogenic food and sugar-sweetened beverage consumption), feeding (i.e. portion size), and movement behaviours (i.e. physical activity and sedentary behaviour). Determinants (assessed in cross-sectional, longitudinal and intervention studies) and their direction of association with each behaviour were extracted and combined according to the socio-ecological model (i.e. individual, interpersonal, organisational and environmental domains). Phase 1 findings were used to inform five co-design webinars with policy and practice partners, healthcare practitioners and childcare providers ('interest-holders') (phase 2), leading to co-production of a range of materials to promote healthy behaviours (phase 3).

Results: Twenty-nine determinants were associated with two or more health behaviours [individual (n=8); interpersonal (n=11); organisational (n=6); and environmental (n=4) domains]. Positive associations were consistently seen between parental monitoring/goals and movement behaviours, and for childcare provider training/policies with movement and dietary behaviours. Negative associations for the use of rewards and treats, child preference/temperament, and parental barriers (including time), were consistently reported across dietary and movement behaviours. After consultation, ten determinants, which were plausible behaviour change targets and aligned with current early years strategies were taken forward to form the basis of the co-design and development work in Phase 2. Co-design webinars with 51 interest-holders identified that their key priorities included supporting healthy weight and promoting physical activity/ healthy food availability; they required resources for parents, childcare providers, healthcare professionals and community support workers; and requested social media friendly stills and videos. Combining this evidence, we co-produced a free-to-use infographic; four short animations (e.g. <https://tinyurl.com/yc8y5yzt>, <https://tinyurl.com/2wj82tbe>); social media stills and dominos (for children).

Conclusion: Common determinants of preschoolers' health behaviours were leveraged to co-develop health promotion materials, incorporating interest-holders' key priorities. Child- and public-friendly outputs, with diverse representations of families, were co-produced to support UK preschoolers' healthy weight.

SHORT ORALS

SO.2.22-07

Adolescents' Perceptions of Health: A Comparison of the Perspectives of Co-design Participants in Finland and the Netherlands

C. Dictus¹, M. Hoogsteder¹, T. Altenburg¹

¹Amsterdam University Medical Centers, Public and Occupational Health, Amsterdam, Netherlands

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Understanding challenges and priorities of adolescents regarding health is essential for potentially effective lifestyle interventions¹. However, approaches to include adolescent perspectives in research have a tendency to generalize though adolescents are a heterogeneous group. This study explores adolescents' perceptions of health and the barriers and facilitators associated with healthy lifestyle behaviors in two different European countries.

Methods: One co-design protocol was applied with 11-14 year olds in Finland and the Netherlands, as part of the Horizon-EU funded SmartCHANGE project. Researchers facilitated 11-16 co-design sessions with adolescents to get insights in barriers and facilitators of adolescents' lifestyle behaviors, to inform the development of a healthy lifestyle app. Co-design sessions were audio recorded and subsequently transcribed. Facilitators completed logbooks and digitalized photos of session outputs such as posters and sticky-notes. All data was coded by at least one research from each study site. Through three in-person meetings, researchers the codebook was created, refined and finalized. Researchers compared the final codes through 6 online sessions.

Results: Both groups perceived social aspects of health (e.g., social support and perceived pressure from parents and teachers) and lack of sleep as more relevant than physical activity or diet, and indicated they did not need a lifestyle intervention themselves. Some unique perceptions in Finland included the prioritization of nature as a facilitator of health and wellbeing, and school duration and homework as a barrier to healthy lifestyle behavior. Dutch adolescents saw their lack of agency in for instance food choices as a barrier for healthy lifestyle behaviors and felt that competition with classmates would motivate them to engage in physical activity, whereas Finnish adolescents felt a strong sense of agency over their food choices and disliked competition as a motivator.

Conclusion: Adolescents from Finland and the Netherlands experience similar perceptions regarding the social aspects of health, pressure and stress, the importance of sleep and not needing lifestyle interventions. Differences between Finnish and Dutch adolescents in their perceptions of health, barriers to healthy behavior and motivators to increase healthy behavior highlight the importance of co-designing interventions in close collaboration with adolescents from the local study sites.

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Mental health disorders affect ~15% of young people aged 10-19 years globally. The social and emotional development which occurs during early childhood is key to providing children with the necessary skills to maintain optimal mental health and wellbeing over the life course. Physical health factors intersect with these outcomes, with adequate nutrition and physical activity positively influencing child mental health. There are few programs available which holistically target these risk factors for children aged 3-6 years and have the potential for scale. We aimed to co-design BLOOM (a digital program to support to support childcare services to embed social and emotional learning, active play and healthy eating into everyday) with childcare educators and managers to address this gap.

SHORT ORALS

Methods: The co-design process was guided by the Generative Co-Design Framework for Healthcare Innovation and involved three research activities with Australian childcare services and their staff. We conducted site visits in childcare services to observe daily activities of childcare services and understand the context of delivering a digital program targeting social and emotional learning with physical health, using an observation tool developed by the research team based on a validated observation tool and contextual research guidance. We conducted four, 1.5 hour online focus groups with childcare educators and managers, using an interview guide developed based on guides previously used by the research team, to understand current practices around social and emotional learning during meal and active play times, barriers and facilitators to implementation and preferences and perceived scalability, acceptability, appropriateness and feasibility of a digital program. We conducted workshops with educators and managers to undertake co-design activities, including storyboarding scenarios and prototype development.

Results: We recruited two services for site visits, 22 participants across focus groups and 12 participants across workshops. We will use thematic analyses to summarise the data, currently underway. We will design the processes, workflows, and features of BLOOM based on workshop findings, including refinement of content, frequency and intensity of implementation strategies and program features.

Conclusion: This co-design process will contribute to the development of BLOOM program and is expected to enhance the scalability and acceptability among childcare services.

SO.2.22-09

Giving Young Children a Voice: A Participatory Mixed-method Study on Physical Activity Preferences of 3- to 6-year Old Children

K. Bel^{1,2}, S.B. Nijenhuis³, E. Hartman³, S.I. de Vries^{2,1}

¹The Hague University of Applied Sciences, Centre of Expertise Health Innovation, The Hague, Netherlands, ²Leiden University Medical Centre Health Campus The Hague, Department of Public Health and Primary Care, The Hague, Netherlands, ³University Medical Center Groningen, University of Groningen, Department of Human Movement Sciences, Groningen, Netherlands

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Young children are naturally inclined to be physically active. However, there is growing evidence that in today's society they do not engage in sufficient physical activity, which has serious consequences for their health and development. The aim of this study is to understand the preferences, barriers and needs of young children themselves, rather than relying on parental perspectives, in order to design effective physical activity intervention strategies that truly resonate with them.

Methods: A qualitative child-centered participatory approach was adopted based on the Mosaic approach (Clark & Moss, 2011) to explore multiple dimensions of children's lived experiences. Participants included 50 children aged 3-6 years and their parents, recruited from Dutch schools, preschools, childcare centers and community settings. Data were generated through

- (1) activity workbooks containing playful movement-related tasks,
- (2) a photovoice assignment in which children photographed places they liked or disliked for being active, and
- (3) short follow-up interviews with the children and parents to explore the stories behind the photos. Data collection continues until December 2025. All qualitative data will be analyzed thematically to identify recurring patterns and meanings.

Results: Preliminary findings indicate that children enjoy participating in the creative, visual methods and can clearly explain what makes movement fun ("running together," "playing outside," "dancing"). However, probing the underlying reasons for preferences remains challenging due to limited verbal abstraction at this age. The final analysis will identify key actors and factors influencing young children's movement behaviors, as well as barriers and facilitators for physical activity.

Conclusion: This study demonstrates that even very young children can meaningfully express their perspectives on physical activity when given the right tools and space. A child-centered participatory approach enriches our understanding of the intrinsic motivation of young children to be physically active and provides valuable insights for designing inclusive, system-based interventions to promote physical activity at young age, that truly reflect children's voices.

SHORT ORALS

SO.2.22-10

Physical Activity Promotion to Prevent Dementia: Lessons from a Participatory Case Study

S. Kohler¹, T. Fleuren², H. Ziemainz¹, K. Abu-Omar¹

¹Friedrich-Alexander-Universität Erlangen-Nürnberg, Department of Sport Science and Sport, Erlangen, Germany,

²Staatliches Gesundheitsamt Erlangen-Höchststadt, Erlangen, Germany

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Promoting physical activity (PA) for active ageing is crucial for the prevention of dementia. The GESTALT – Get 10 project pursued this goal by establishing PA promoting structures in ten municipalities in Bavaria (Germany) between 2020 and 2024. This study aimed to illustrate how a participatory approach can facilitate the development and implementation of municipal structures that support PA-related health promotion.

Methods: The theoretical understanding of the “Interplay between structure and agency” formed the framework for sustainably anchoring the project. The “cooperative planning approach” was applied to foster PA-related structural changes across various municipal levels through a participatory network that empowers local stakeholders (multipliers, political decision-makers, practitioners, researchers, and representatives of the population) in a targeted process. Further the implementation of an evidence-based PA program for dementia prevention was integrated in this process.

Results: Within the project funding, all municipalities hired local coordinators who were responsible for participatory implementation of the project. In 30% of the municipalities, the coordinator positions were made permanent after the funding period ended in order to manage PA-related health promotion in the municipality in the long term. During the project funding, a cooperative planning network was established in half of the ten participating municipalities, while the others used adapted network structures for various reasons. Six months beyond project funding, the established networks for promoting PA continued in 60% of municipalities. The GESTALT PA program was implemented in all ten municipalities and continued (partially adapted) six months after the funding period.

Conclusion: During the project’s funding phase, the establishment of local coordinators and the involvement of relevant stakeholders through a cooperative planning approach and tailored networking processes led to PA-related structural changes of varying scope. Six months after the end of the funding phase, however, efforts to establish sustainable structures at the local level were partially continued. In terms of the GESTALT PA program implementation, it was successfully implemented and continued across all ten municipalities. The extent to which this was positively influenced by the parallel establishment of PA promoting structures through the participatory approach requires further qualitative investigation.

SO.2.22-11

Time Measurement Validity and Reliability of the 6-M Gait Speed Test in Adult Population: The Adult-FIT Project

C. Cruz-León^{1,2}, N. Marín-Jiménez^{1,2,3}, M. Borges Cosic^{4,1,2}, F.J. Cíes-Valleras^{1,2}, D. Camiletti-Moirón^{1,2}, M. Cuenca-García^{1,2}, J. Castro-Piñero^{1,2}, GALENO Research Group

¹University of Cadiz, Physical Education, Puerto Real, Spain, ²Instituto de Investigación e Innovación Biomédica de Cádiz (INIBICA), Cádiz, Spain, ³University of Almeria, Health Research Center, Almeria, Spain, ⁴University of Granada, Physical Education and Sport, Granada, Spain

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: We aimed to examine the time measurement validity and reliability (inter-raters and test-retest) of the 6-m gait speed test to assess motor fitness, according to sex, age, and physical activity levels.

Methods: Cross-sectional study. A total of 410 adults (203 females) aged 18-64 years were involved. The time required to perform the 6-m gait speed test was recorded simultaneously by a trained (R1) and untrained (R2) raters (inter-rater reliability), and by photoelectric cells (time measurement validity). The test was repeated under the identical

SHORT ORALS

conditions (test-retest reliability) 48-72 hours later.

Results: The systematic errors between photoelectric cells with R1 and R2 were close to zero (0.015, $p < 0.001$), and ~ 0.2 seconds ($p < 0.001$), respectively. Both presented an effect size < 0.11 . There was a systematic error between R2 and R1 of ~ 0.2 seconds ($p < 0.001$), with an effect size of 0.051. Retest-test systematic error was -0.047 seconds ($p < 0.01$), with an effect size of 0.067. The intraclass correlation coefficient was 0.984 and all error measurements reported low values, except percentage coefficient of variation that was 14.386. There was not heteroscedasticity in all cases ($p > 0.05$). Time measurement validity and reliability were not influenced by sex, age groups and physical activity levels.

Conclusion: These findings suggest that measurements with R1 are a valid and reliable method for assessing the 6-m gait speed test in adults. It is strongly recommended that raters be trained in order to reduce the measurement error as much as possible.

SO.2.22-12

“Everything I Need Is a Walk away from Me:” Understanding Adolescents’ Active Mobility Habits in High-rise Environments

E. Cervinka¹, L. Smith¹, A. Buttazzoni², A. Wray³, R. Lo⁴, L. Minaker², J. Gilliland⁵

¹University of Toronto, Geography and Planning, Toronto, Canada, ²University of Waterloo, School of Planning, Faculty of Environment, Waterloo, Canada, ³University of Tennessee at Knoxville, Department of Public Health, Knoxville, United States, ⁴Urban Minds, Toronto, Canada, ⁵University of Western Ontario, Department of Geography and Environment, London, Canada

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Active mobility is widely recognized as beneficial for health and well-being. While adults may intentionally cultivate a habit of active travel as part of a healthy lifestyle, adolescents face unique circumstances of developing autonomy and limited financial resources, increasing reliance on self-propelled, active modes. Through co-created research, this project investigates whether health considerations influence adolescents’ mobility in high-rise urban environments, or if active travel is an incidental benefit of their lifestyle.

Methods: Twenty-two adolescents (13-18) took part in participant-led go along interviews in diverse neighbourhoods across two Canadian cities (Toronto and Kitchener-Waterloo). Interview routes included locations youth perceived to impact their health. Locations and routes were logged by researchers while participants classified locations as “healthy/unhealthy” and captured photographs of locations with a smartphone app. Transcripts were analyzed using inductive thematic analysis, revealing key themes and subthemes focused on the meanings urban-dwelling adolescents construct about “getting around” in their daily lives.

Results: Connections between socialization, physical activity, and well-being were reflected throughout the interviews. Adolescents expressed a desire to walk or cycle around their neighbourhood to enjoy different sights, people, and “the energy,” where being outdoors was an escape from constant screen use. Participants also highlighted the importance of social spaces, including community centres, restaurants, and parks, while describing difficulties in visiting friends in the suburbs due to distances that cannot be spanned by foot or bike. As such, accessibility (“ease of reach”) of youth-friendly destinations was the defining determinant of where adolescents chose to go. Adolescents distinguished between movement for transport and movement for exercise. Sport was understood as deliberate physical activity, whereas active travel was simply how to get somewhere. This theme of “unconscious” and “conscious” mobility demonstrated how accessibility in high-rise environments encouraged adolescents to unconsciously favour active transportation modes.

Conclusion: Adolescents emphasized access to relevant spaces as important for shaping active travel as mode choice. These findings contribute to physical activity research by highlighting the need to connect youth-specific designs with active travel infrastructure, thereby advancing public health gains through physical activity, as well as chronic disease prevention, sustained healthy behaviours, and the mitigation of social isolation.

SHORT ORALS

SO.2.22-13

From Network to Action: Living Lab 'The Supportive Sports Club' as Breeding Ground for Developing a Sports Support Organization

M. de Greeff¹, J. Moeijes¹, M. van Saarloos², F. van der Steen³, R. Lont⁴

¹University of Applied Sciences Windesheim, Research Group Movement, Health and Well-being, Zwolle, Netherlands,

²School Advisory Institute In Opbouw, Dronten, Netherlands, ³Healthcare Institution Intraverte, Apeldoorn, Netherlands,

⁴Sports Service Organization Sport in Dronten, De Meerpaal, Dronten, Netherlands

SO.2.22 Participatory Research in Health Promotion: Participatory Approaches and Co-Creation in Physical Activity and Health Promotion

Room 5, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Children with mild psychosocial problems frequently drop out of regular organized sport activities. Living Lab The Supportive Sports Club aims to strengthen collaboration between primary schools, health care institutions, and sports clubs in the Dutch municipality of Dronten by creating a interorganizational network. The current action-research aims to lower barriers to participation in organized sports for children with mild psychosocial problems (e.g., anxiety, impulsivity, social withdrawal).

Methods: The study follows an action-research design comprising three interdependent work packages:

(1) Screening and referral, a dual-stage screening process combining motor skills tests and behavioral observations by physical education teachers, community sport coaches and psychomotor therapists. Children and parents receive personalized advice on suitable after-school physical activities;

(2) After-school physical activities, building on existing activities, the Living Lab adapts and expands weekly structured physical activities. Implementation is monitored through semi-structured interviews with parents and trainers, participation counts and on-site observations by psychomotor therapists;

(3) Sport support, youth trainers receive on-site coaching from psychomotor therapists and digital support through the prototype mobile app App4Support, which provides contextual tips for dealing with challenging behavior. Evaluation includes semi-structured trainer interviews and observations. A triangulated approach integrated thematic analysis and participation trend data.

Results: The interorganizational network promotes trust and collaboration among professionals and youth trainers, increases trainers' competence and fosters children's engagement. The dropout rate from sports among the target group is expected to decrease. Coordination between organizations in the fields of education, care, and sport improves. Structural municipal funding enhances the sustainability of the network.

Conclusion: The Supportive Sports Club demonstrates how a Living Lab approach can translate collaboration into concrete practice. Establishing and developing an evidence-based pathway that bridges the gap between health, education, and sport. This replicable model fosters inclusive and permanent sports participation of children with mild psychosocial problems.

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health

Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: In Europe, young adults are at a higher risk of poverty than other age groups, potentially affecting their health, well-being, and academic outcomes. We analyzed the associations between poverty and dietary patterns among university students in a socioeconomically disadvantaged area.

Methods: In 2023, we initiated a sub-cohort of higher education students within the NutriNet-Santé study (an ongoing web-based cohort launched in France in 2009). The present cross-sectional analysis is based on data collected at enrollment in the study, from students attending University Sorbonne Paris Nord (France), located in a socioeconomically

SHORT ORALS

disadvantaged area, in the greater Paris area. The frequency of consumption of 15 food groups was assessed using a short food frequency questionnaire, and dietary patterns were derived by principal component analysis. Poverty in living condition was assessed using a questionnaire capturing material and social deprivation, with poverty defined as a score ≥ 5 . Multivariable linear regressions were performed to analyze associations between poverty and food patterns, adjusted for sex, age, field of study, scholarship, international status, and living with parents.

Results: This study included 442 students (57% women, mean [SD] age 21.2 [4.1], 44% reporting a situation of poverty, 10% reporting consuming the recommended five portions of fruits and vegetables per day). Three main dietary patterns were retained, explaining together 42% of the total variance in diet (19.0%, 14.8% and 8.3%, respectively): “low consumption” (negatively correlated with all food groups), “unhealthy” (negatively correlated with healthier food groups, eg fruits, vegetables, beans, nuts, fish, and positively correlated with less healthy food groups, eg snacking and fast-food products, sugary drinks, processed meat) and “meat-oriented” (positively correlated with poultry, red meat, whole grains). Poverty was positively associated with the “low consumption” (standardized β [95% CI] 0.09 [-0.01;0.19]) and “unhealthy” (standardized β [95% CI] 0.13 [0.03;0.23]) patterns, but not with the “meat-oriented” pattern.

Conclusion: Within a student population with substantial socioeconomic disadvantage, poverty was associated with less healthy dietary patterns after adjusting for sociodemographic characteristics, which may have implications for student-focused public policies. Poverty was not associated with the “meat-oriented” pattern, suggesting that meat consumption may be shaped more by cultural factors than by financial constraints.

SO.2.23-05

Building and Evaluating a Behavioral Support Intervention for Adolescents Undergoing Bariatric Surgery

M. Allcock¹, J. Francis², R. Braxton³, M. Misserian², M. Mathew², A. Wheelington², B. Cartwright², S. Neti¹, D. Polavarapu¹, F. Qureshi², F. Atem¹, S. Barlow², S. Messiah²

¹UTHealth Houston School of Public Health, Health Promotion and Behavioral Science, Dallas, United States, ²UT Southwestern Medical Center, Dallas, United States, ³UTHealth School of Public Health, Dallas, United States

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health
Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Globally, the prevalence of severe obesity among adolescents is increasing. Stand-alone behavioral lifestyle modifications are insufficient for long-term clinically significant weight loss. Metabolic and bariatric surgery (MBS) is an effective treatment increasingly utilized among adolescents. Integrating MBS with lifestyle support may further optimize treatment outcomes. However, no standardized lifestyle interventions currently exist to address behavioral pre- and post-operative needs of adolescents undergoing MBS. We developed TeenLyft, a 6-month online behavioral intervention adapted from the Diabetes Prevention Program and guided by adolescent and parent input. Here, we describe the design process and evaluation using the RE-AIM framework.

Methods: We collected qualitative and quantitative data from adolescents undergoing evaluation for MBS (N=19, mean age 15.2 years, range 13-17, 76.0% female, 42.1% non-Hispanic Black, 42.1% non-Hispanic White, 15.8% Other, 59% Hispanic) and parents (N=13) to guide TeenLyft development. The subsequent proof-of-concept project enrolled 76 adolescents from an adolescent bariatric clinic to receive TeenLyft. Using a mixed-methods approach, data sources at baseline (pre-surgery), 3- and 6-month post-MBS follow-up included anthropometric measures, cardiometabolic biomarkers, physical activity, and interviews. Quantitative data provided descriptive statistics, and paired t-tests assessed within-subject changes over time to evaluate effectiveness. Qualitative data were thematically analyzed.

Results: Our formative work indicated adolescents desired content for healthy eating, stress management, motivation for weight management behaviors, and preferred online content delivery. RE-AIM evaluation showed *Reach* as 29 (38.1%) of 76 adolescents enrolled who completed MBS. *Effectiveness:* Older age was significantly associated with greater excess weight loss (EWL >50%: 16.8 $\pm$ 0.7 vs. 15.3 $\pm$ 1.1 years, $p=0.0083$), as was female sex ($p=0.0062$). Physical activity improved, but change was not significant from baseline to follow-up. Adolescents reported TeenLyft supported their physical health but needed more mental health content. *Adoption:* Clinical staff involvement was critical for recruitment and content development. *Implementation:* TeenLyft modifications included adding social media messaging for increased engagement. *Maintenance:* Adolescents attended follow-up clinic visits at 6- and 12-month (83% and 67% respectively).

Conclusion: Pairing MBS with behavioral support can positively impact health outcomes. Strategies to support mental health and long-term follow-up for monitoring weight regain, nutritional deficiencies, and psychological challenges are needed.

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health
Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Affordable step-counting tools are vital for promoting physical activity in low- and middle-income countries (LMICs) where access to objective activity monitors is limited. This study compared the Omron pedometer and ActivPAL accelerometer against a criterion step count across walking speeds in obese and non-obese Nigerian adults to assess their validity for population-level monitoring in resource-limited settings.

Methods: Thirty-two female university students (20 obese, 12 non-obese) completed treadmill trials at 1.9 m/s, 3.7 m/s, and preferred walking speed (PWS). Step counts (steps per minute, spm) from the ActivPAL accelerometer and Omron pedometer were compared against a criterion reference (mean of hand tally and video counts). Agreement between each device and the criterion was assessed using Bland-Altman analysis to estimate bias (mean difference), 95% confidence intervals, and limits of agreement (LOA) across walking speeds and BMI groups.

Results: Participants (mean age = 22.1 ± 1.0 y; BMI = 32.0 kg/m², IQR = 11.3) were classified as obese (27.7-37.2 kg/m²) or non-obese (19.0-23.7 kg/m²). Bland-Altman analysis showed the ActivPAL consistently underestimated step counts across speeds with smaller, more stable errors than the Omron pedometer. At PWS, biases were -14.5 spm (95% CI: -17.4 to -11.6; LOA: -23.1 to -5.9) [non-obese] and -2.7 spm (95% CI: -8.8 to 3.4; LOA: -31.3 to 26.0) [obese] for the ActivPAL, versus +7.5 spm (95% CI: 4.9 to 10.0; LOA: -0.1 to 15.1) [non-obese] and +5.9 spm (95% CI: -4.2 to 16.0; LOA: -41.4 to 53.2) [obese] for the pedometer. Across speeds, pedometer biases were -24.5 spm (95% CI: -32.2 to -16.7; LOA: -61.0 to 12.1) at 1.9 m/s, -0.5 spm (95% CI: -6.8 to 5.9; LOA: -30.2 to 29.3) at 3.7 m/s, and +5.9 spm (95% CI: -4.2 to 16.0; LOA: -41.4 to 53.2) at PWS, demonstrating greater error variability than the ActivPAL.

Conclusion: The ActivPAL showed more consistent agreement with the criterion across walking speeds and BMI groups, while the Omron pedometer exhibited greater variability, particularly among obese participants. These findings support the ActivPAL as a more reliable step-counting tool for research and public health applications in low-resource settings.

SO.2.23-07

Walking Cadence among Young Adults: Does the Absolute Threshold of 100 Steps/Min Really Correspond to a Moderate Intensity?

L.G. Grossi Porto¹, D.R.F. Saint-Martin¹, B. Lima de Oliveira¹, A.P. Costa¹, G.E. Molina¹, GEAFS - Grupo de Estudos em Fisiologia e Epidemiologia do Exercício e da Atividade Física

¹Universidade de Brasília - UnB, Faculdade de Educação Física, Brasília, Brazil

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health
Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Physical activity (PA) surveillance studies have extensively used questionnaires to identify those who meet or do not meet the recommended minimum amount of moderate to vigorous PA (MVPA). Usually, any reported walking activity is computed as moderate PA, regardless of its intensity, which can lead to measurement errors. To overcome this limitation, walking cadence has been suggested as a low-cost metric for quantifying walking intensity. We aimed to evaluate the walking intensity of young adults by measuring walking cadence in two specific situations.

Methods: In a cross-sectional study, we evaluated 261 young adults (39.5% women) with a mean age and BMI of 22.0±4.0 years and 23.8±3.0 kg/m², respectively. Volunteers wore a Digi-Walker® pedometer and were instructed to perform two laps on a 400-meter athletic track at two different self-determined speeds: light walk and brisk walk.

SHORT ORALS

The lap times and step counts were used to calculate walking cadence (steps/min) and to verify whether the speed instructions were followed. Walking intensity was considered moderate when step cadence ≥ 100 steps/min, and vigorous when ≥ 130 steps/min (Tudor-Locke et al., 2019). Due to non-normal distribution (Shapiro-Wilk test), data are expressed as median (interquartile range-IQR). Wilcoxon and Mann-Whitney tests were used for comparisons at 5%.

Results: The brisk walking lap was statistically faster than the light one: 238s (222-250s) vs 310 (287-334s) ($p < 0.001$), confirming that the speed instructions were followed. Step cadence at brisk pace was higher [125 (118-131) steps/min] than at the light-paced lap [108 (101-115)] steps/min ($p < 0.001$). The same occurred when the speed and cadence comparisons were split by sex ($p < 0.005$). On both laps, the median and IQR of walking pace would be classified as moderate intensity.

Conclusion: Young adults walking at light intensity would have this PA classified as moderate. Despite the equivalence between a cadence of 100 steps/min and an oxygen consumption corresponding to 3 METs, this cadence is reached by young adults at an undeniably light intensity, given that it was predefined by instruction. Our findings support the need to adjust PA intensities to variables well-recognized as influencing PA intensity, such as age and physical fitness.

SO.2.23-08

#whatleatinaday: A Comparative Content Analysis of what I Eat in a Day Videos on Tiktok in Men and Women

S. Galway¹, K. Angrish¹, R. Galati¹, K. Gammage²

¹Brock University, St. Catharines, Canada, ²Brock University, Kinesiology, St. Catharines, Canada

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health
Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: What I eat in a day videos are popular on social media, especially TikTok. In these videos, men and women showcase food, fitness and lifestyle-related content. Although researchers have examined characteristics of what I eat in a day videos on TikTok, gender has not been accounted for in previous content analyses. Thus, this research has overwhelmingly and disproportionately focused on women despite the popularity of videos among men and women. The purpose of this study was to examine if content in TikTok what I eat in a day videos differ between men and women.

Methods: As part of a larger content analysis, we searched the terms 'what I eat in a day women' and 'what I eat in a day men' using the TikTok explore function and saved the top 110 videos for each gender; a total of 209 videos were analyzed (104 women, 105 men). A codebook was developed, and videos were coded by the research team. Descriptive statistics were calculated, and independent samples t-tests and Pearson chi-square statistics were conducted to examine differences across fitness-related and food-related content between men and women.

Results: Several elements were similar between men and women, including the number of meals and drinks consumed, the inclusion of macronutrient information and engaging in fitness and exercise behaviours ($ps > .05$). However, calorie counting, and mention of calories were more frequent by men ($p = .047$, $p = .003$). Men also more frequently attributed their diet with physical changes ($p = .010$). Although men more frequently showed themselves eating food ($p = .013$), they consumed fewer snacks than women ($p = .020$).

Conclusion: Our findings showcase gendered differences across what I eat in a day videos on TikTok and highlight that videos with men include more diet-related content than women. Researchers should examine how viewing this content impacts physical and mental well-being in men and women.

SO.2.23-09

Physical Literacy Is an Important Predictor of Wellbeing in NZ Adolescents, Independent of Total Physical Activity

J. Gale^{1,2}, A. Bauman³, J. Richards¹

¹Victoria University of Wellington, Te Hau Kori, Centre for Physical Activity and Wellbeing, Wellington, New Zealand,

²Auckland University of Technology, School of Sport, Exercise and Health, Auckland, New Zealand, ³The University of Sydney, School of Public Health, Sydney, Australia

SHORT ORALS

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health
Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Many adolescents do not accumulate sufficient physical activity to meet guidelines, even though greater levels of physical activity promote benefits for physical and mental wellbeing. Physical literacy (PL) is an important determinant of physical activity and wellbeing. However the extent to which PL is independently associated with mental wellbeing is unexplored in the NZ adolescent population. This study describes the associations between total, and elements of PL with self-reported mental wellbeing, independent of physical activity, using data from the Active New Zealand survey 2021.

Methods: Overall, 1924 adolescent respondents (12-17 years, 58% female) completed the 6-item PL and single-item wellbeing (out of 10) questionnaires and the International Physical Activity Questionnaire – Adolescents. PL was assessed by each element (motivation, confidence, knowledge, physical competence, support and opportunity; each score out of 5) and as a sum score (out of 30). Logistic regression models were employed to examine associations between PL (low: <24, high: 24-30) and elements of PL (low: 1-4, high=5), and high wellbeing, independent of total physical activity (minutes per week).

Results: Independent of total physical activity (mean 23.8 hours/week SD 18.2), compared to those with low PL, adolescents with high PL had 3.64 greater odds of reporting high wellbeing (95%CI 2.94 to 4.51, $p<0.0001$). This remains true for all elements of PL whereby those with high element-specific PL had greater odds of having high wellbeing, compared to those with low element-specific PL. When PL scores were separated into moderate (total: 24-27; elements=4) and high (total: 28+; elements=5) a dose response association was observed for total PL (moderate PL: OR 2.52, 95%CI 1.99 to 3.19, $p<0.0001$; high PL: OR 6.04, 95%CI 4.66 to 7.82, $p<0.0001$) and all elements of PL with the exception of knowledge (moderate PL: OR 0.69, 95%CI 0.43 to 1.10; high PL: OR 1.51, 95%CI 0.98 to 2.32).

Conclusion: Physical literacy is positively associated with mental wellbeing in adolescents, independent of the amount of physical activity accumulated. Policy level interventions to increase wellbeing in this age group should consider a focus on all elements of PL, acknowledging that knowledge alone may not be sufficient to improve wellbeing.

SO.2.23-10

Longitudinal Associations between Screen Viewing and Mental Health among University Students

M. Chen¹, R. Nishika¹, X.H. Chua¹, B.C. Tai^{1,2}, F. Müller-Riemenschneider^{1,3}

¹National University of Singapore and National University Health System, Saw Swee Hock School of Public Health, Singapore, Singapore, ²National University of Singapore, Yong Loo Lin School of Medicine, Singapore, Singapore, ³Berlin Institute of Health, Charité, Digital Health Centre, Berlin, Germany

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health
Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Dependency on screen viewing (SV) has reached unprecedented levels, and mental health issues are becoming a major public health concern. However, longitudinal evidence on how SV relates to mental health remains limited. This study examined longitudinal associations between SV behaviours and mental health among university students.

Methods: Data were drawn from the Healthy Campus Initiatives cohort, a longitudinal study following first-year undergraduates to graduation (AY2021/22–AY2024/25) at the National University of Singapore. Self-reported questionnaires assessed sociodemographic, SV, physical activity, sleep, and mental well-being (WHO-5 Well-Being Index). Generalized linear mixed models were used to account for repeated measures. Time-varying predictors were decomposed into within-person (deviation from each individual's mean) and between-person (mean SV across timepoints) components to test whether poorer mental health was associated with (a) students who generally used more screens, or (b) periods when a student used more screens than usual. No statistically significant correlation or collinearity was observed between the within- and between-person SV variables in the same model. Models were adjusted for demographics and time-varying health behaviours (physical activity and sleep). The primary analyses included all participants with at least one timepoint, and sensitivity analyses were conducted among students who completed all three timepoints, incorporating random slopes to account for within-person variability.

Results: Among 997 students at baseline (mean age = 20.2 years; 59.6% female), 567 (56.9%) completed all three surveys. From baseline to the second follow-up, poor well-being prevalence ranged from 33.6% to 32.4%, and psychological distress from 13.9% to 9.7%, while mean total daily SV declined slightly (14.1 → 13.3 → 12.7 hours/day).

SHORT ORALS

In the primary models (997 participants), higher total daily SV was associated with poorer well-being [OR(95%CI): 1.07(1.03, 1.10)], while within-person effects were not significant. Sensitivity analyses (567 participants) using random slopes yielded similar but attenuated results [OR(95%CI): 1.04(1.01, 1.07)].

Conclusion: Consistently high SV levels were associated with poorer mental well-being over time. The weaker within-person effects suggest that SV fluctuations may not substantially affect mental health. Persistent, heavy screen engagement appears more detrimental, underscoring the need to address habitual SV patterns in campus-based digital wellness strategies.

SO.2.23-11

Exploring Students' Preferences, Engagement and Experiences of Sleep and Sedentary Behaviour Interventions whilst at University

E. Procter¹, R. James^{2,3}

¹SHAPE Research Group, School of Science and Technology, Nottingham Trent University, Nottingham, United Kingdom,

²Leicester Diabetes Centre, University of Leicester, Leicester, United Kingdom, ³NIHR Leicester Biomedical Research Centre, Leicester, United Kingdom

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health
Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: As part of a doctoral thesis investigating university-based health interventions, we used a mixed-methods approach to examine students' preference for, engagement with and experience of two health-promoting interventions.

Methods: University students were invited to self-select into either an online sleep education intervention (an education-focused approach) or an at-home standing desk intervention (an environmental modification approach). The interventions spanned 7-weeks, with engagement monitored via online tracking, daily logs, and recall. The perceived benefits of and barriers to the interventions were assessed using exit questionnaires. Outcomes for sleep, sedentary behaviour, physical activity, mental wellbeing, anthropometric and cardiometabolic biomarkers were also investigated alongside a control group as part of the thesis.

Results: Of 257 students, 165 showed a preference for the sleep education intervention, while 92 preferred the standing desk intervention. Fifty-six started the sleep intervention, with 93% completing the 7 weeks, while 25 began the desk intervention, with 84% retention. After completing the sleep education programme, 88% stated they enjoyed it, and 64% would have liked to receive it in their first year of university. Sixty-four per cent described their perceived sleep quality to be 'better', and 62% reported an increase in sleep duration. The main barriers for not implementing the education included an inconsistent schedule (60%), academic workload (44%) and stress (30%). For the desk intervention, 90% stated they would use one if provided by the university, but only 57% would consider purchasing their own. Reported benefits of the desks included improved energy (57%), focus (52%) and productivity (43%), while barriers included lack of motivation (33%), space (24%) and limited time spent working at home (24%).

Conclusion: University students demonstrated greater interest and engagement with the sleep-focused intervention, highlighting improved sleep as a key health priority for students. Students who used the standing desk, however, reported positive experiences; therefore, such interventions could still be effective if logistical barriers are addressed, and the intervention remains accessible and sustainable over time. Overall, both interventions achieved strong student engagement, indicating that aligning intervention focus with students' health priorities and allowing choice may maximise both engagement and impact in university settings.

SO.2.23-12

Individualized Effects of a Digital Lifestyle Intervention and their Associations with High School Students' Characteristics, Health Behaviors, and Psychosocial Factors

L. Hedin^{1,2}, A. Seiterö³, J. Crawford⁴, M. Bendtsen⁴, M. Löf⁵

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health

Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Although the most frequent focus in effectiveness studies is the conditional average intervention effect, dismantling individualized effects would provide a foundation for creating tailored interventions. The aim of this study was to estimate individualized effects of a digital health behavior intervention, LIFE4YOUth, among high-school students in Sweden.

Methods: Data from a randomized controlled trial was used, year 2020–2023, including 756 high school students with at least one risk health behavior regarding low physical activity, unhealthy diet, alcohol intake, or smoking. The intervention included content and strategies for establishing health behaviors together with weekly monitoring and feedback. Outcomes, followed up at 2 and 4 months, were weekly moderate-to-vigorous physical activity (MVPA), daily fruit and vegetable intake (FV), total weekly alcohol consumption, and monthly heavy episodic drinking (HED). Individualized intervention effects at 4 months were modelled using individual characteristics, baseline measures of health behaviors, and psychosocial factors.

Results: The individualized intervention effects were smaller at 2- than at 4- months for MVPA, mean (SD) increase 38.8 (18.6) vs 62.7 (37.4) minutes, and for HED, -0.1 (0.2) vs -0.2 (0.2) monthly episodes. Greater effects were seen at 2- than 4- months for FV intake, 0.4 (0.1) vs 0.2 (0.2) portions, and weekly alcohol consumption, -0.7 (0.1) vs -0.2 (0.2) units. Heterogeneity of individualized effects were larger at 4 months where standardized baseline MVPA, i.e., 1 SD from the mean, showed the strongest associations with favorable intervention effects: MVPA, 33.5 minutes (95% Col = 32.3; 34.7), FV, 0.18 portions (95% Col = 0.17; 0.18), HED, -0.2 episodes (95% Col = -0.2; -0.2), and weekly alcohol intake, -0.15 units (95% Col = -0.15; -0.14). Further, heterogeneity was related to baseline alcohol intake, male sex, university educated parents, family economy, higher life satisfaction, confidence, and knowledge of changing behaviors.

Conclusion: The findings emphasize that different individuals experienced varied effects from a digital intervention, and that factors including sex, socioeconomic status, and baseline physical activity explained this heterogeneity. The results can be used to identify groups of individuals for whom current interventions are not effective and to tailor health promoting interventions to individual needs.

⁶Mount Sinai Hospital, Toronto, Canada

SO.2.23 Young adult: From Measurement to Management: Multidisciplinary Approaches to Lifestyle Health

Room 6, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: The primary purpose of this study was to compare the sociodemographic profile and lifestyle behaviours of women with obesity and infertility from the Fit-for-Fertility (FFF) trial with those of a representative sample of Canadian women (PREDIS study). We hypothesized that women with obesity and infertility would display less favorable lifestyle profiles. This study is innovative as it provides a direct comparison using harmonized assessment tools.

Methods: This cross-sectional analysis included baseline data from 136 women aged 18–40 years with infertility and obesity (BMI ≥ 30 kg/m²) or overweight (BMI ≥ 27 kg/m²) with polycystic ovary syndrome, recruited from five fertility clinics. Comparisons were made with 245 women from Quebec in the PREDIS study. Both samples were assessed using validated tools for dietary intake (web-based FFQ) and physical activity (IPAQ), and comparable sociodemographic and sleep data were collected. Diet quality was derived using the HEFI-2019, while dietary intakes and movement behaviours were compared with Dietary Reference Intakes (Estimated Average Requirements (EAR) and Acceptable Macronutrient Distribution Ranges (AMDR)), and with the Canadian 24-Hour Movement Guidelines. Group differences were tested using t-tests, Mann–Whitney U, or chi-square tests.

Results: By design, FFF participants had higher BMI and waist circumference and were less likely to identify as white

SHORT ORALS

or hold a university degree compared with PREDISE participants. Energy intake was similar between groups, but FFF women consumed a greater proportion of energy from fat (39.4% vs. 35.9%, $p<0.001$) and protein (17.5% vs. 16.5%, $p=0.003$), and a lower proportion from carbohydrate (44.4% vs. 47.6%, $p<0.001$). Fewer met adequacy thresholds for protein ($\text{EAR} \geq 0.66 \text{ g/kg}$), fat ($\text{AMDR } 20\text{--}35\%$), and carbohydrates ($\text{EAR} \geq 100 \text{ g/d}$) (all $p \leq 0.002$). Diet quality was poorer among FFF participants (46.4 vs. 50.3, $p<0.001$). They also reported less moderate-to-vigorous physical activity (128 vs. 210 min/week, $p<0.001$), more sedentary time (8.0 vs. 6.0 h/day, $p=0.01$), and fewer met sleep recommendations (67.9% vs. 80.0%, $p=0.04$) compared with PREDISE women.

Conclusion: This study advances behavioral nutrition and physical activity research by identifying lifestyle disparities between women with obesity and infertility and the general population. Findings underscore the need for tailored preconception interventions integrating lifestyle support within fertility care.

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Performance-based tests (PBTs) objectively assess functional capacity and are increasingly applied in fibromyalgia (FM) to complement patient-reported outcomes (PROMs). However, evidence regarding their reliability, especially considering patients socio-occupational status, is limited. This study examines how employment and disability status—socioeconomic determinants closely linked to physical activity and health—modulate the reliability and interpretation of objective functional tests in women with FM. It highlights how psychosocial and medicolegal contexts may introduce inequalities in physical performance and measurement reproducibility.

Methods: Eighty-seven women with FM were assessed twice, ten days apart. The battery included the 6-Minute walking test (6MWT), handgrip strength test, and 8 feet up and go test (8FUG). Test-retest reliability was examined using the intraclass correlation coefficient (ICC, model 3.1), standard error of measurement (SEM), and smallest real difference (SRD) according to Consensus-based Standards for the selection of health Measurement Instruments (COSMIN) recommendations. Analyses were conducted for the total FM group and for three socio-occupational subgroups (actively working, claiming disability, and permanent disability).

Results: All PBTs demonstrated excellent test-retest reliability ($\text{ICC} \geq 0.90$). Absolute reliability indices ($\text{SEM}\% < 10\%$; $\text{SRD} < 30\%$) confirmed acceptable measurement stability. However, the claiming disability group showed markedly higher $\text{SEM}\%$ and $\text{SRD}\%$ for handgrip strength ($\geq 14\%$ and $\geq 38\%$ respectively), suggesting reduced reproducibility. The 6MWT and 8FUG maintained excellent reliability and stability across all groups. PROMs (FIQ-R, HADS and SF36) showed good-to-excellent reliability, though actively working patients presented slightly lower stability.

Conclusion: The selected PBTs provide reliable, objective measures of physical performance in women with FM. Nevertheless, handgrip strength should be interpreted cautiously in patients claiming disability, as psychosocial and medicolegal factors may affect measurement consistency.

SO.2.24-03

Cardiorespiratory Fitness Levels in French Adults

J. Vanhelst¹, S. Pereira¹, M. Touvier¹, J. Oppert^{1,2}, L. Fezeu Kamedjie¹

¹Université Sorbonne Paris Nord and Université Paris Cité, INSERM, INRAE, CNAM, Center of Research in Epidemiology and Statistics (CRESS), Nutritional Epidemiology Research Team (EREN), Bobigny, France, ²Pitié-Salpêtrière Hospital (AP-HP), Sorbonne University, Department of Nutrition, Human Nutrition Research Center Ile-de-France (CRNH IdF), Paris, France

SHORT ORALS

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: To date, there has been no exploration of cardiorespiratory fitness (CRF) monitoring in adults in France. The aim of this study was to evaluate CRF levels and their determinants in France.

Methods: A total of 15,089 French adults (3,087 men, 12,002 women) aged 18-69 years from the French NutriNet-Santé prospective web-cohort was included in the present analysis. Participants completed the Huet web-based questionnaire to assess CRF. Maximal oxygen uptake as indicator of CRF was estimated using validated age-specific equations. Statistical calibration to the French population was applied to the data. A healthy lifestyle score was constructed, including smoking status, physical activity, sedentary behavior, and diet, ranging from 0 to 4, with higher scores indicating healthier lifestyle. Weighted means of the estimated CRF were compared across categories of socio-demographic characteristics, anthropometric data, and categories of lifestyle score. Tukey's honest significant difference test was used for multiple comparisons.

Results: Significant differences were found in mean estimated CRF regarding of lifestyle habits, socio-demographic and anthropometric characteristics ($p < 0.01$). Estimated CRF values decreased with age, with higher estimated CRF level in younger and lower level in older. Estimated CRF was highest in blue-collar workers ($41.8 \pm 9.6 \text{ mL.kg}^{-1}.\text{min}^{-1}$) and lowest in retired people ($25.0 \pm 5.6 \text{ mL.kg}^{-1}.\text{min}^{-1}$; $p < 0.01$). Participants within the highest lifestyle score category had higher estimated CRF ($37.2 \pm 11.1 \text{ mL.kg}^{-1}.\text{min}^{-1}$), compared to those in the lowest category ($33.8 \pm 8.8 \text{ mL.kg}^{-1}.\text{min}^{-1}$) ($p < 0.0001$). The same was observed for participants in the intermediate category ($37.0 \pm 10.6 \text{ mL.kg}^{-1}.\text{min}^{-1}$), who had higher estimated CRF compared to those in the lowest category ($p < 0.0001$). These trends were generally consistent for both sexes. Finally, the proportion of participants with a low estimated CRF was 45.3% in total and higher in women (63.1%) vs. men (26.9%; $p < 0.01$).

Conclusion: Results from this study showed marked variations in estimated CRF levels by sociodemographic and lifestyle factors. About two thirds of women and one third of men, had a low CRF level. These results support the need to include CRF, preferably with objective measures, in health surveillance and as basis for preventive strategies at population level.

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: The cumulative impact of socioeconomic (SE) vulnerabilities on adolescents' cardiovascular health (CVH) remains underexplored. This study evaluated the association between accumulated SE vulnerabilities and longitudinal changes in CVH during adolescence, using the Life's Essential 8 (LE8) score.

Methods: The study included 1299 adolescents (48.3% girls; mean age at baseline 12.5 years [SD=0.4]) from 24 secondary schools in the metropolitan areas of Madrid and Barcelona. SE vulnerability was classified as low (0-1), intermediate (2-3), or high (4-6) based on parental education, household income, and parental occupation status. LE8 scores were assessed when participants were ~12, ~14, and ~16 years old. Adjusted associations were analyzed

SHORT ORALS

using multilevel mixed-effects models.

Results: At baseline, LE8 scores showed an inverse gradient across SE vulnerability groups (high: 75.8 [95% CI, 74.6–77.0]; intermediate: 76.3 [75.5–77.0]; low: 79.1 [78.5–79.7]), with similar trends at follow-up. LE8 scores declined over time, with a mean change from baseline of -1.2 (95% CI, -1.7 to -0.8) at 2-year FU and -3.3 (95% CI, -3.8 to -2.8) at 4-years FU, and with greater impairment in adolescents with higher SE vulnerability (2-year p for trend = 0.009, 4-year p for trend = 0.033). The largest differences were observed in nicotine exposure: compared with adolescents in the low vulnerability group, the intermediate and high SE vulnerability groups showed significantly larger declines in the nicotine exposure metric after 4 years [low: -18.3 (95% CI, -21.9 to -14.7), intermediate: -24.8 (95% CI, -28.4 to -21.2), high: -29.2 (95% CI, -34.6 to -23.9); p for trend <0.001]. Among individual SE indicators, household income showed the strongest association with LE8 score (p for trend < 0.001).

Conclusion: Accumulated SE vulnerabilities were associated with lower CVH and steeper decline over the course of adolescence. Household income emerged as the main driver of this association, with nicotine exposure showing the greatest sensitivity to the SE gradient. Health promotion strategies during adolescence should account for SE vulnerabilities to reduce CVH inequalities.

SO.2.24-05

Expanding Healthy Food Access through Pay-what-You-can Restaurants: Perspectives and Menu Evidence from US Community Cafes

A. MacMillan Uribe¹, A. McNeely², L. Borchers³, H. Eicher-Miller⁴, R. Nayga⁵, R. Seguin-Fowler⁶, J. Szeszulski¹, X. Wang⁷

¹Texas A&M AgriLife Research, Institute for Advancing Health Through Agriculture, Dallas, United States, ²University of Texas-Dallas, Richardson, United States, ³Texas Christian University, Fort Worth, United States, ⁴Purdue University, West Lafayette, United States, ⁵Texas A&M University, College Station, United States, ⁶Texas A&M University, Institute for Advancing Health Through Agriculture, College Station, United States, ⁷Texas A&M AgriLife Research, Fort Worth, United States

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: U.S. community cafes (hereafter cafes) are pay-what-you-can restaurants that often emphasize nutrient-dense meals with potential to enhance healthy food access for food-insecure individuals, who often have lower diet quality than food-secure individuals. The study purpose was to characterize cafes' role in improving healthy food access via perceptions of executive directors and managers (EDMs) and assessing healthy food menu offerings among U.S.-based cafes.

Methods: A mixed-methods exploratory sequential design began with semi-structured online interviews with EDMs ($n=13$). Next, descriptive analysis of café menus ($n=10$) determined inclusion of Dietary Guidelines for Americans (DGA) recommended food groups (e.g., fruit, vegetables, whole grains) and other menu elements (e.g., designating meals meeting dietary needs, like gluten-free). Interview analysis used a directed approach with initial codes based on five healthy food access dimensions, supplemented with descriptive menu statistics.

Results: EDM participants ($n=13$) from 10 cafes were predominantly white (85%), female (69%), with >3 years in their role (85%). Four themes were constructed: (1) Cafes aimed to provide appetizing and "produce-forward" meals; this is reflected in menus where vegetables appeared in 52.8±20.2% and fruit in 17.8±20.0% of menu items. (2) EDMs wanted to nourish guests through hearty, nutrient-dense foods; the DGA components protein appeared in 50.4±16.1% of menu items, followed by dairy in 23.0±15.8%; greens or beans in 22.5±15.4%; fish, seafood, or plant protein in 21.0±12.4%; and whole grains in 11.0±11.0%. (3) Cafe staff encouraged healthier eating through fostering trust with guests, offering familiar "comfort" foods as a bridge to healthier options, and creating a dignified, choice-based dining experience. (4) EDMs aimed to accommodate dietary needs and preferences; 70% of menus included at least one dietary designation, with most labeling vegan/vegetarian (70.0%) and gluten-free (70.0%) dishes.

Conclusion: Cafes may increase healthy food access among food-insecure guests by offering meals including DGA components, while accommodating dietary needs and preferences and encouraging shifts towards healthier eating. Including some food groups (e.g., fruit, whole grains) more often could improve nutritional quality of meals. More research is needed to assess availability versus consumption of DGA components as well as the impact of cafe patronage on diet quality among food-insecure guests.

SO.2.24-06

Inequities in Organised Physical Activity Participation by Different Axes of Inequality among Children in Madrid, Spain

L. Cereijo¹, R. Valiente², J. Díez³

¹University of Alcalá, Department of Biomedical Sciences, Alcalá de Henares, Madrid, Spain, ²University of Alcalá, Department of Geology, Geography and Environment Science, Alcalá de Henares, Madrid, Spain, ³University of Alcalá, Department of Surgery, Medical and Social Sciences, Alcalá de Henares, Madrid, Spain

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Inequalities in children's physical activity are well-documented, but further exploration is needed, particularly in organized physical activity (OPA), which offers greater health benefits, across various dimensions of inequality. This study aims to explore the effect of family socioeconomic status (SES), sex, and availability of public sport facilities (APSF) on OPA participation of children from Madrid, Spain.

Methods: This cross-sectional multilevel study analysed data from 5,961 children aged 3–12 years, drawn from a 2017 representative survey in Madrid, Spain. SES was measured using the Family Affluence Scale, categorized into tertiles. OPA data came from the survey. APSF was assessed using Geographic Information Systems, counting facilities within 1,000m street-network buffers around schools operationalized into tertiles. Multilevel Poisson regression models with random intercepts for schools were used to examine the association between SES and OPA, using the highest SES tertile as reference. Analyses were stratified by sex and APSF tertiles, with the highest as reference, adjusted by age, sex, and population density.

Results: The findings showed that those children from the lowest SES presented a 43% lower Prevalence Ratio (PR) than those from higher SES (PR=0.57 IC95% 0.50-0.65). Gender differences in the association between SES and OPA were also observed, with a higher PR decrease for girls from low SES families (PR=0.54 IC95% 0.45-0.65) than for boys (PR=0.58 IC95% 0.49-0.68). Furthermore, the APSF has been shown to influence the distribution of inequalities in OPA, amplifying the effect of household socio-economic status on OPA in areas with limited access to such facilities. Areas with lower APSF showed the stronger association between SES and OPA (PR-lowSESvsHighSES = 0.49 IC95%0.39-0.62), compared to other low socio-economic populations with medium (PR-lowSESvsHighSES = 0.57 IC95%0.45-0.69) and higher (PR-lowSESvsHighSES = 0.68 IC95% 0.54-0.84) APSF.

Conclusion: Our results reveal significant inequalities in children's participation in organized physical activity in Madrid, influenced by family SES level, sex, and access to sports facilities. These findings underscore the importance of developing public policies aimed at cushioning these inequalities to improve the health of the school-age population.

SO.2.24-08

Bridging the Gap in Early Childhood Motor Development: Preliminary Evidence from a Public Preschool Program in Recife, Brazil

A. Chuhdry¹, G. Freire², J. Silva³, C. Lira³, M. Marques³, R. Tassitano¹

¹University of Illinois, Department of Health and Kinesiology, Urbana-Champaign, United States, ²University State of Maringá, Department of Physical Education, Paraná, Brazil, ³University State of Pernambuco, Associate Program of Physical Education, Pernambuco, Brazil

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Early childhood movement is positively associated with motor, cognitive, and social development. However, significant gaps remain in equitable access to early movement programs in low- and middle-income countries. This study describes motor competence and evaluates whether a universally accessible public program is associated with reduced motor development disparities in children from low-income communities in Brazil.

Methods: We conducted a population-based cross-sectional study among 1,497 children aged 3–6 years enrolled in public day-care centers in Recife, Brazil. Children were randomly and proportionally sampled across six Political-Administrative Regions (PARs). PARs were categorized into low, medium, and high social vulnerability using the Social

SHORT ORALS

Vulnerability Index. Trained educators assessed motor competence using the Test of Gross Motor Development-2. Group differences in locomotor, object-control, and global motor scores were examined using ANOVA with Tukey post-hoc comparisons. Within-region inequality in motor performance was measured using the coefficient of variation. Crude and adjusted linear regressions estimated associations (β , 95%CI) of vulnerability category, age, and sex with motor outcomes.

Results: Mean global motor scores varied across regions, ranging from 59.45±18.93 in PAR 4 to 72.88±21.16 in PAR 6, with the greatest dispersion observed in PARs 3 and 4. Motor competence increased significantly with age across all domains ($p < 0.001$). Boys demonstrated higher object-control scores ($\beta = -1.46$; 95%CI: -2.20, -0.67), while girls performed slightly better in locomotor skills ($\beta = 1.05$; 95%CI: 0.06, 2.04). After adjustment for age and sex, children in high-vulnerability regions had significantly lower scores than those in low-vulnerability regions for both object-control ($\beta = -6.38$; 95%CI: -7.50, -5.26) and global motor competence ($\beta = -7.26$; 95%CI: -9.56, -4.97), with moderate-to-large regional effects ($\eta^2 = 0.08-0.10$).

Conclusion: This public program represents one of the first large-scale initiatives to promote and expand access to structured movement in early childhood in Brazil. While universal program availability may have contributed to some reduction in within- and between-region disparities, substantial performance gaps persisted, particularly in high-vulnerability areas. As recently implemented initiative, longer follow-up may be needed to detect its impact. Program expansion remains critical, alongside targeted investments in professional development, and adequate facilities in high-vulnerability regions to prevent early widening of developmental inequities.

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: This study assessed the effectiveness and equity of the Lifestyle Hub (LH) referral pathway to health and wellbeing services for inactive adults with long-term health conditions across six local authorities in Pennine Lancashire, UK. The LH footprint has a population of 560,000, a high proportion of South Asian residents and high levels of deprivation. The LH forms part of a Sport England funded approach to tackling inequalities as part of a wider ecosystem of place-based approaches. We examined referral patterns, assessment uptake, and achievement of weight management and physical activity programme goals, applying an equity lens to identify drivers of engagement disparities and inform scalable, inclusive interventions.

Methods: This study analysed routine quantitative programme monitoring data, collected between October 2024 and September 2025, including demographic variables, referrals, initial assessments and practitioner-recorded outcomes for physical activity and weight management. Pearson chi-squared tests assessed differences in programme outcome achievement by gender, age and ethnicity. An ongoing complementary qualitative study involving interviews with stakeholders and focus groups with participants in one of six localities is exploring contextual factors underlying engagement inequalities.

Results: Preliminary analysis found 15,916 referrals to wellbeing services, with 7644 (48%) completing an initial assessment. There were 7,801 referrals for physical activity and weight management, 6,612 (85%) of these included a programme outcome measurement, and 1,732 (22%) were considered to have successfully completed the programme. Programme outcome achievement was significantly different by ethnicity ($p < 0.001$) and age ($p < 0.001$) but not gender ($p = 0.702$). Lower programme achievement was observed among Black (13%) and Asian (19%) ethnicities compared with White participants (39%) and among those of younger age (25% <60 vs. 44% ≥60).

SHORT ORALS

Conclusion: The LH achieved high referral and assessment uptake, but only 22% of participants successfully completed physical activity or weight management programmes. Significant disparities in programme achievement were observed by ethnicity and age, with lower success among Black and Asian participants and younger age groups, while gender showed no effect. These findings highlight persistent inequalities in engagement and outcomes within real-world referral systems. Ongoing qualitative work will explore contextual and structural factors to inform strategies for more equitable implementation.

SO.2.24-11

Predicting Future Risk of Type 2 Diabetes by Socioeconomic Inequality and Physical Activity in Ontario, Canada: A Population-based Analysis

G. Fazli¹, A. Zehra², L. Lipscome³, K. Kornas⁴, F. Ali⁴, L. Rosella⁴

¹University of Toronto Mississauga, Geography, Geomatics, and the Environment, Mississauga, Canada, ²University of Toronto Mississauga, Mississauga, Canada, ³Women's College Hospital, Toronto, Canada, ⁴University of Toronto, Toronto, Canada

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Risk prediction tools provide critical opportunities to implement diabetes prevention strategies. The purpose of this study is to predict the future risk of diabetes by sociodemographic and health behaviours such as physical activity in an urban population.

Methods: We used population data from the 2017/18 Canadian Community Health Survey, a national cross-sectional survey questionnaire, to predict the 10-year risk of diabetes among adults (aged ≥ 20 years) living in Ontario, Canada. We applied a validated Diabetes Population Risk Tool (DPoRT) to risk factor information to predict the distribution of 10-year type 2 diabetes incidence and the number of new diabetes cases in the subsequent ten years both overall and across important subgroups.

Results: Overall, there were 33,474 survey respondents included in this study, of whom 3,249 (9.7%) were living with a diagnosis of diabetes and 30,225 (90.3%) without diabetes. Between 2017/18 to 2027/28, DPoRT predicted a 10-year diabetes risk of 10.2% (95% confidence interval [CI] 9.9-10.4) and 919,702 new cases. The greatest predicted 10-year risk of diabetes will be among immigrant populations (12.2% and 398,425 new cases), lowest- household quintile (<20,000 per year (26.1% risk and 191,750 new cases), those who reported living with obesity (21.3% risk and 326,517 new cases), and those who were sedentary (sitting more than 8 hours/day) (10.9% risk and 37,594 cases) and least physically active (12.8% risk and 238,649 cases). Similar patterns were observed for food insecure households.

Conclusion: The projected incidence of diabetes is attributed to socioeconomic inequalities and modifiable risk factors such as physical inactivity and sedentary behaviours. This research calls for a combination of targeted and population-wide strategies that will address the risk factors of diabetes and reduce its future burden among those affected the most.

SO.2.24-12

Wearable Measured Work and Leisure-time Physical Behavior Clusters and Associations with Socioeconomics, Perceived Health and Health Behaviors

M. Niemelä^{1,2}, A.-M. Leinonen^{1,3,4}, M. Vaaramo^{3,5}, N.-P. Hirvonen¹, V. Farrahi^{1,6}

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

SHORT ORALS

Purpose: Physical behaviors, including sedentary time (ST) and physical activity (PA), have domain-specific health associations; heavy occupational PA associating with adverse health and lower leisure-time PA. We aimed to identify movement profiles that integrate both work-related and leisure-time physical behaviors, and to investigate whether these profiles differ in socioeconomics, perceived health, and health behaviors.

Methods: Data used comes from Northern Finland Birth Cohort 1966 46-year follow-up ($n=3,117$). All participants providing valid accelerometry data (≥ 2 days ≥ 4 hours wear time at work, ≥ 2 days off from work, wear time ≥ 10 hours/day), self-reported work schedule, health and lifestyle information (perceived health, work ability, smoking, and drinking) were included. Information on education and salary was obtained from national registers.

Physical behaviors were calculated as mean duration of ST, light and moderate-to-vigorous PA separately for work and leisure time. For clustering, relative proportion of different components of total time in each domain was calculated. The relative share of each activity was set 0–1 (1=largest share in the population, 0=no activity). Clustering was performed with K-means. Elbow method, gap statistic, and within sum of squares were used to determine the number of clusters. Differences between clusters in frequencies were assessed using Pearson Chi-squared test and in continuous variables using ANOVA.

Results: Five clusters were identified: Work movers (sedentary leisure time, $n=641$), All-day movers ($n=432$), All-day sedentary ($n=874$), Leisure light movers (sedentary work, $n=759$), and Leisure movers (sedentary work, $n=411$).

High education was least prevalent (23–25% vs. 69–73%) and annual salary lowest (27k€–29k€ vs. 40–45k€) in All-day movers and Work movers. Work movers had less often good perceived health (61% vs. 70–85%) and work ability (81% vs. 83–92%) than others. They also had the most smokers (25% vs. 15–19%) and the highest alcohol consumption (71 g/week vs 50–61 g/week). The highest prevalence in good perceived health and work ability was seen in Leisure movers. All comparisons were significant ($p \leq 0.001$).

Conclusion: Five different clusters were identified, showing different patterns in work and leisure-time physical behaviors and in sociodemographic and health behavior outcomes. Overall, Work movers presented the poorest outcomes.

SO.2.24-13

The Long-term Effects of a Combined Physical Activity and Health Education Programme on Well-being for Socially Vulnerable Children and Adolescents

K. Pfeiffer¹, M.N. Larsen², J. Heidler², T.K. Møller³, G. Tarantino², N. Ntoumanis², P. Krstrup²

¹University of Southern Denmark, Department of Sports Science and Clinical Biomechanics, Odense, Denmark, ²University of Southern Denmark, Odense, Denmark, ³Steno, Copenhagen, Denmark

SO.2.24 Socio-economic inequalities: Context Matters: The Impact of Environment, Privilege, and Social Vulnerability on Health Behaviors

Room 7, May 29, 2026, 3:00 PM - 5:00 PM

Purpose: Childhood and adolescence are critical periods for the development of well-being, yet declines are commonly observed, particularly among youth from low socioeconomic backgrounds. This study examined the short- (3.5 months) and long-term effects (16 months) on well-being of a residential multicomponent health promotion intervention at the Danish Christmas Seal Homes (DCSH), with and without the addition of the 11 for Health (11fH) programme.

Methods: A randomised crossover design compared a Standard group (DCSH, $n=237$) to a Standard+ group receiving the same programme plus 11fH (combined football and health education sessions, $n=244$). Well-being was assessed using the Pediatric Quality of Life Inventory (PedsQL 4.0 Generic) and KIDSCREEN-27. Multilevel modelling evaluated changes in well-being outcomes over time, accounting for repeated measurements nested within individuals.

Results: Participants in both groups reported well-being scores at or above normative values post-intervention, with these largely maintained at short- and long-term follow-ups. No significant group differences emerged through time. Physical Well-being declined over time, while Physical Functioning improved at short-term follow-up, but the increase was not sustained at the long-term follow-up. Females reported lower scores than males across several domains, including Physical Functioning, Emotional Functioning, Physical Well-being, and Psychological Well-being. Older age and higher pre-intervention scores were associated with lower well-being improvements

Conclusion: The results suggest that health-promoting interventions delivered in residential settings can help sustain well-being for socially vulnerable children. Moreover, consistent gender differences point to the need for ongoing support and tailored approaches for females.

SHORT ORALS

SO.3.25-01

Observing Dimensions of Food Literacy among Children and Parents Participating in a Dutch Cooking Course

K. Bessems¹, L. Beenackers¹, L. Harms¹, P. van Assema¹

¹Maastricht University, Health Promotion, Maastricht, Netherlands

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Food literacy is an important prerequisite for healthy eating. It encompasses the knowledge, skills and abilities needed to interact with the food environment in a way that encourages the development of healthy, sustainable eating habits. Up for Cooking (UfC) aims to improve the food literacy of children and parents. Participants cook and eat together and complete short assignments. This study aims to gain insight into the presence and absence of the relational, functional and critical dimensions of food literacy among participants, as defined by the conceptual framework of Ares and colleagues.

Methods: Between November 2020 and June 2024 researchers observed 55 cooking sessions across 18 courses. Observations focused on the implementation of food literacy-related activities and participant engagement. For the analysis, situation sketches and text fragments that could be linked to the three dimensions of food literacy, were summarised. These fragments were coded as either 'present' or 'absent' using Atlas.ti, with sub-codes for each food literacy dimension and assigned to either the parent, the child, or a parent-child pair.

Results: Relational dimensions, particularly the enjoyment of preparing meals together, were frequently observed (76 times) in children and parents. The enjoyment of trying new food was also frequently observed. The absence of relational dimensions was observed 30 times, mostly due to unfamiliarity with different types of food. Functional dimensions were observed 47 times, primarily in relation to hygiene and food safety, but also to insufficient motor and food preparation skills. The absence of functional dimensions was observed 28 times, primarily relating to fine and gross motor skills (e.g. knife use) and knowledge of nutrition and hygiene. Finally, critical dimensions were not observed.

Conclusion: Although relational and functional dimensions of food literacy were frequently observed, critical dimensions were not. The absence of certain aspects, such as familiarity with different types of food and fine and gross motor skills, among at least some participants could be addressed in future courses. While not all dimensions of food literacy were observable in this context, we conclude that participants vary in their level of food literacy and that this needs to be improved to promote healthy eating.

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Feeding and nutrition impact childhood dental health, including tooth formation and the development of health-promoting or cariogenic habits. Most research on dietary risk factors of tooth decay in the primary teeth of children aged under six years (early childhood caries, ECC) focus on individual foods (e.g. fruit juice) or dietary patterns, but not individual nutrients. There is minimal research on new forms of complementary foods, such as

SHORT ORALS

pouch foods with nozzles, on dental health – however, there are concerns of exposure to high-sugar purees, excessive intake of free sugar, and repeated exposure to sweets foods that may affect taste preferences. This study aims to describe predictors of ECC in toddlers and preschoolers.

Methods: The Young Foods New Zealand study was a cross-sectional observational study with children aged 1-3.9 years, involving anthropometric measurement, nutrient intake from two 24-hour dietary recalls, and ECC status from dental photographs. Differences between caries-free and caries-positive children were estimated using regression analysis, adjusted for age.

Results: 259 children were analysed, of which 13.9% had ECC. Having ECC was associated with child and carer ethnicity, carer education, childcare use, and current breastfeeding status. Food pouch use, direct feeding from a food pouch nozzle, and weight status were not significantly associated with ECC status. Nutrient intakes were similar in those with and without ECC, including sugars intake. Caries-positive children had lower mean vitamin A (432 vs 526 µg, $p=0.004$) and marginally lower calcium (634 vs 715 mg, $p=0.072$) intake, compared to caries-free children, but were at no greater risk of inadequate intake.

Conclusion: ECC status was associated with demographic characteristics but not current use of food pouches, in contrast to expectations that pouch use may adversely impact child dental health through exposure to sugary foods. Children with ECC largely met nutritional requirements but had lower vitamin A and calcium intakes. Product audits have highlighted the increasing presence and availability of pouch foods – further empirical research on the long-term impact of frequent food pouch use on dental health is required.

SO.3.25-03

Breastfeeding Duration and Early Feeding Practices Are Associated with Ultra-processed Food Intake in Youth 12-14 Years Exposed to Gestational Diabetes

E. Hudson¹, J. Davis¹, K. Haushalter¹, M. Burgermaster^{1,2}, J. Josefson^{3,4}, L. Greenspan⁵, E. Gunderson⁵, Y. Zhu^{5,6}

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Ultra-processed foods (UPFs) are linked to adverse metabolic profiles. Children exposed to gestational diabetes (GDM) are at elevated metabolic risk, making diet a priority. We evaluated breastfeeding and complementary feeding in the first year predicted UPF intake at age 12-14 in a GDM-exposed cohort.

Methods: SWIFT is a prospective, multi-ethnic cohort of women with GDM and their children. GDM diagnosis and perinatal outcomes were obtained from electronic health records. Research surveys collected infant feeding parameters from birth to 12 months; breastfeeding duration (months; <6 vs ≥6), intake of sugary beverages (<12 months), and introduction to complementary foods (months; <4 or ≥4 vs later). At 12–14-years, dyads completed three 24-hour dietary recalls and other assessments. UPF was quantified as %grams and %kcal using NOVA classification. Analyses included dyads with ≥2 recalls. Linear regression models were sequentially adjusted for race/ethnicity, maternal education, maternal nativity, pre-pregnancy BMI, and concurrent maternal UPF intake.

Results: Youth participants ($n=229$; mean age 13.4 ± 0.9 y; 50% female; 39% Asian, 39% Hispanic) derived $32.4 \pm 17.0\%$ of grams and $54.7 \pm 17.3\%$ of energy (kcal) from UPFs. In fully adjusted models, breastfeeding less than 6 months was associated with higher UPF %grams in offspring ($\beta = 5.0$, $p = 0.029$). Early complementary feeding (<6 months) predicted higher UPF %grams ($\beta = 5.5$, $p = 0.03$), with each month delay in introduction corresponding to 1.87 percentage points fewer UPF %grams ($p=0.009$). Breastfeeding less than 6 months combined with either introduction of juice/sugar-sweetened beverages in the first year or early complementary feeding (< 6 months) were each associated with higher UPF %grams ($\beta = 8.9$, $p = 0.009$; $\beta = 10.0$, $p=0.003$). UPF %kcal was positively associated with breastfeeding less than 6 months plus early complementary feeding in unadjusted models, however findings were not significant after adjustment.

Conclusion: Adolescents who were breastfed less than 6 months and began complementary feeding early or consumed juice/sugar-sweetened beverage in their first year of life consumed an additional 9-10% grams from UPF than adolescents who were breastfed > 6 months and introduced complementary foods or sweet beverages at the appropriate age.

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: This study aimed to examine the measurement invariance of the Children's Eating Behaviour Questionnaire (CEBQ) between parents from Spain and the United Kingdom.

Methods: A total of 197 participants (142 mothers and 49 fathers) from the Spanish sample, aged 44.07 years (SD=5.98), and 300 participants (252 mothers and 48 fathers) from the UK sample, aged 35.29 years (SD=5.60), took part in the study. The UK sample included parents of children aged between 4 and 6 years (M=4.89; SD=0.74), whereas the Spanish sample included parents of children aged between 7 and 10 years (M=8.90; SD=0.84). Measurement invariance across countries was evaluated following the method proposed by Wu and Estabrook (2016). Four levels of invariance were assessed: configural (factor structure), metric (item factor loadings), scalar (item thresholds for categorical responses), and strict (item uniqueness). According to Chen (2007), invariance is supported when the change in fit indices between consecutive models meets the following criteria: $\Delta CFI \leq 0.01$, $\Delta SRMR \leq 0.03$ for metric invariance or ≤ 0.01 for scalar invariance, and $\Delta RMSEA \leq 0.015$.

Results: Multigroup factorial invariance was evaluated through configural, metric, scalar, and strict models using robust estimators. The configural model ($\chi^2=3082.36$, $df=1130$, $CFI=0.916$, $TLI=0.911$, $RMSEA=0.084$, $SRMR=0.097$) showed fit indices slightly above acceptable thresholds for RMSEA and SRMR, which are indices sensitive to small misfits in the functioning of any item. In the UK validation, a slightly different structure was observed, with items 3 and 27 loading on different factors and item 35 being removed. Therefore, the original factorial model may be somewhat rigid across countries. However, when progressively imposing equality constraints, changes in fit indices were minimal ($\Delta CFI \leq 0.01$; $\Delta RMSEA \leq 0.015$; $\Delta SRMR \leq 0.03$ for metric and ≤ 0.01 for scalar), meeting Chen's (2007) recommended thresholds and supporting construct equivalence across countries.

Conclusion: This study provides robust evidence that the 35-item CEBQ is a valid tool for assessing children's eating behaviours in both Spain and the UK, supporting its use in cross-cultural comparisons and interventions. Researchers and practitioners can use the CEBQ to compare children's eating behaviours across European contexts, contributing to the early identification of behavioural patterns related to societal issues (e.g. childhood obesity).

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

SHORT ORALS

Purpose: Physical activity behavior in adolescents is complex and cannot be fully explained by examining associations or causal links between influencing factors and activity levels. There is a need for insight into underlying mechanisms driving behavior, which can be achieved with mediation analyses. This review aims to summarize the current evidence on the mediating pathways that shape adolescents' physical activity behaviors.

Methods: Three core concepts – adolescents, physical activity, and mediation – were used to develop a search strategy. MEDLINE, Embase, Scopus, and SPORTDiscus were searched for relevant articles. After deduplication, titles and abstracts were screened with support of ASReview. Data extraction was done by 2 reviewers for each manuscript. The SAFE procedure was applied as a conservative approach to ensure the inclusion of all relevant articles.

Results: In total, 10,696 articles were screened by title and abstract, resulting in 369 articles for full-text screening; 183 met the eligibility criteria. The studies were conducted in Europe (n=59), North America (n=54), Asia (n=47), South America (n=9), and Oceania (n=8). In addition, six studies were conducted in multiple countries. Physical activity behaviors were mostly measured with questionnaires (n=142) and a smaller number using objective methods (n=32). Some studies used both (n=9). In total, 212 unique factors were examined as potential mediators. The most frequently studied mediators were psychosocial constructs such as self-efficacy, autonomous motivation, intention, and enjoyment. Across the included studies, 35 different theories and conceptual frameworks were applied, while 40 studies did not use any theoretical basis. The most commonly used theories/frameworks were Social Cognitive Theory, Self-Determination Theory, the Trans-Contextual Model, and Theory of Planned Behavior.

Conclusion: The included studies provide deeper insight into the interactions between psychosocial factors, the social and physical environment, and physical activity behavior, as well as into the interrelations among psychosocial factors in adolescents. Nevertheless, the findings largely reflect the emphasis of research on psychosocial factors as mediators. Broadening the analytical focus to encompass alternative mechanisms may help us better understand the complexity of physical activity behaviors. In particular, considering environmental factors as potential mediators could yield additional insights into the influence of contextual factors on physical activity behavior.

SO.3.25-06

Multi-trajectories of Lifestyle Patterns and BMI z-Scores in Early Childhood and Hierarchical Determinants: The Healthy Beginnings Trial

M. Zheng¹, L.M. Wen^{2,3}, S. Lioret⁴, A. Descarpentrie⁵, K. Hesketh⁶

¹University of New South Wales, School of Health Science, Faculty of Medicine and Health, Sydney, Australia, ²The University of Sydney, School of Public Health and Sydney Medical School, Sydney, Australia, ³Sydney Local Health District, Health Promotion Unit, Population Health Research and Evaluation Hub, Sydney, Australia, ⁴Université Paris Cité and Université Sorbonne Paris Nord, INSERM, INRAE, Centre for Research in Epidemiology and Statistics (CRESS), Paris, France, ⁵University of Southern California, Department of Pediatrics, Children's Hospital Los Angeles, Keck School of Medicine, Los Angeles, United States, ⁶Deakin University, Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Geelong, Australia

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The co-development of lifestyle patterns (LPs) and body mass index z-score (BMIz) in early childhood remains unclear. This study aimed to identify multi-trajectories of LPs and BMIz in early childhood, and assess associations with family-, maternal- and child-level factors.

Methods: Data at ages 2, 3.5 and 5 years from the Healthy Beginning Trial (n=387) were used. Two consistent LPs were identified at all ages using principal component analysis: unhealthy "Discretionary foods-screen" pattern and a healthy "Fruits-vegetables-outdoor-sleep" pattern. LPs and BMIz scores were used in multi-trajectory modelling to identify groups of children following similar concurrent trajectories of LPs and BMIz from ages 2 to 5 years. Hierarchical regression explored factors associated with the identified multi-trajectory groups.

Results: Children were classified into four distinct multi-trajectory groups. Over one-third (36.4%) followed the 'Less-healthy LP, Low-BMI' trajectory, showing low adherence to the healthy LP, average adherence to the unhealthy LP, and a low BMIz trajectory. A further 33.1% displayed average adherence to both unhealthy and healthy LPs but a high BMIz trajectory, referring as the 'Mixed LP, High-BMI' group. The other two groups were 'Healthy LP, Mid-BMI' (20.8%) and 'Unhealthy LP, Mid-BMI' (9.8%). Both followed a mid BMIz trajectory, with the former showing higher adherence to healthy LP and lower adherence to unhealthy LP, and the latter showing reverse LP adherence. Children with higher household income, whose mother had higher diet quality and physical activity during pregnancy, higher

SHORT ORALS

pre-pregnancy BMI, or were Australian-born (vs. overseas-born), were more likely to follow the 'Healthy LP, Mid-BMI' trajectory than the 'Unhealthy LP, Mid-BMI' trajectory. In contrast, children from families with two parents and other members (vs. single parent families) were less likely to belong to this group. Children born to women with higher pre-pregnancy BMI or lower education were more likely to belong to the 'Mixed LP, High-BMI' group.

Conclusion: Findings highlight the need to promote healthy lifestyle behaviours early in life regardless of body weight status. Interventions should prioritise families with lower income or larger household size, and those with Australian-born mothers with higher pre-pregnancy BMI, lower education, poor diet quality, or low physical activity.

SO.3.25-07

Avid Appetite, Surgency, Inhibitory Control and Adiposity in 3-5-year-Olds: A Laboratory Study

J. Blissett¹, K. Edwards², A. Pickard³, E. Haycraft⁴, M. Herle⁵, C. Llewellyn⁶, C. Farrow¹

¹Aston University, Institute of Health and Neurodevelopment, Birmingham, United Kingdom, ²University of Birmingham, School of Psychology, Birmingham, United Kingdom, ³University of Edinburgh, Department of Clinical Psychology, Edinburgh, United Kingdom, ⁴Loughborough University, School of Sport, Exercise and Health Sciences, Loughborough, United Kingdom, ⁵King's College London, Institute of Psychiatry, Psychology & Neuroscience, London, United Kingdom, ⁶University College London, Institute of Epidemiology and Health Care, London, United Kingdom

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: An 'avid eating' behaviour profile in preschoolers is associated with parent report of temperament, including greater surgency (positive affect, high activity levels, tendency to approach rewards and novelty) and impulsivity (a tendency to act/react rapidly, without forethought), but these relationships have not been examined observationally. This laboratory-based study investigated relationships between parent reports of children's avid eating and temperament, with observed measures of impulsivity/inhibitory control and objective BMI. We hypothesised that children reported to have a higher probability of avid eating will

i) be rated as more surgent and impulsive,

ii) have higher BMI,

iii) show poorer performance on laboratory measures of impulsivity/inhibitory control.

We also explored relationships between parent report and laboratory measures of surgency/impulsivity, inhibitory control and BMI.

Methods: Parents (N=129, 6M, 123F) and children (3-5 years; 54M, 75F) attended our laboratory. Parents completed questionnaires about their child: Children's Eating Behaviour Questionnaire (Wardle et al., 2001), Children's Behaviour Questionnaire-Very Short Form; (Putnam & Rothbart, 2006) and Conners' 9-item hyperactivity-impulsivity subscale (Conners et al., 1998). Children completed tasks measuring delay of gratification, inhibitory control (Bear-Dragon task; fish flanker task) and motor impulsivity (Circle drawing task: CDT). Children were weighed and measured; age and sex-adjusted BMIz was calculated. Partial correlation analyses were conducted, adjusted for covariates.

Results: Children with a higher probability of avid eating were rated as significantly more surgent and impulsive by their parents, but did not have higher BMIz. Neither did they show poorer performance on behavioural measures of inhibitory control/impulsivity.

Children who were rated as more surgent or impulsive by their parents showed poorer CDT performance. Parent reports of surgency were also related to higher BMIz. BMIz was associated with children's poorer CDT performance.

Conclusion: Parents who report greater avid eating in their 3-5-year-olds report more impulsivity and surgency, but avid eating was not related to observed inhibitory control or adiposity at 3-5-years. Parent-reported surgency and impulsivity specifically reflect motor inhibition. Surgency was associated with greater adiposity, suggesting an important focus for further work. Understanding surgency (e.g., sociability, novelty-seeking) may help to identify useful intervention strategies to manage children's avid eating.

SHORT ORALS

SO.3.25-08

Food Is Medicine Clinical Community Intervention to Improve Dietary Intake, Mental Health, and Clinical Outcomes among Families

A. Gustafson¹

¹University of Kentucky - Food as Health Alliance, Dietetics and Human Nutrition, Lexington, United States

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Primary purpose of the clinic-community linked intervention was to examine the effect of a two-by-two randomized controlled trial utilizing a food is medicine program including nutrition and mental health counseling among caregivers and their children.

Methods: A pragmatic randomized control trial (pRCT) using a 2X2 factorial design among Medicaid families, adults with children ages 6-18, with an adult diagnosed with hypertension or T2DM, child has a BMI categorized as obese or overweight, and report being food insecure. The pRCT will take place in Louisville, KY with UofL Health as the clinic provider, in an urban setting with a high percentage of adults reporting race/ethnicity as Black or African American. Participants were recruited from two clinic sites by their healthcare provider. After referral patients completed consent and were randomized to one of four arms: 1) Medically tailored meals (MTM) only for adult and up to 2 children; 2) MTM for caregiver and up to \$100 in a grocery prescription (Grocery Rx) card for children in the household; 3) Grocery Rx for up to \$150 for the household; 4) Delayed comparison. Each arm received their intervention program for 3 months. *Primary outcomes of interest* include child BMI percentile, blood pressure, hemoglobin A1c, and lipid panels.

Descriptive statistics, including means, standard deviations, frequency, and percentages, will be calculated at baseline and post-intervention to describe the participants in each group. *t*-test and ANOVA will be used to further assess differences in the primary outcomes between the four study arms.

Results: Among adults in the MTM program only and in the MTM + Grocery arm there was a reduction in systolic blood pressure (-8.33mmHg) and LDL (-2 mg/dL) and (-6.75mmHg) and LDL (-3mg/dL) between baseline and post intervention. Among children in the MTM+Grocery arm there was a reduction in systolic blood pressure (-5mmHg) and in Grocery only arm a reduction of (-3mmHg). Relative to delayed controls there were significant improvements in LDL, blood pressure, dietary intake, and general health.

Conclusion: A food is medicine program providing healthy tailored food for both the adult and children in the household has the potential to improve clinical outcomes.

SO.3.25-12

Advancing Diet and Health among Produce Prescription Program Participants in Rural Eastern North Carolina: The Phytorex Families Pilot Study

B. Enahora¹, S. Jilcott Pitts², Q. Wu²

¹NC State University, Agricultural and Human Sciences, Raleigh, United States, ²East Carolina University, Public Health, Greenville, United States

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: This pilot study aimed to assess the effectiveness of a produce prescription program to improve health and nutrition-related outcomes among rural adult-child dyad participants in North Carolina (NC).

Methods: Adult-child dyads (adults/caregivers and their child, 8 to 14 years old) were referred by pediatricians from one rural NC health clinic to participate in a produce prescription program, consisting of receiving a weekly box of ~15 lbs of fresh produce, and attending a bi-weekly nutrition education class. Trained researchers collected participant data at baseline (T1) and at post-intervention (16 weeks, T2) on cardiovascular health-related outcomes (blood pressure (BP), glycated hemoglobin (HbA1C), height, weight (body mass index (BMI) calculated)) and nutrition-related outcomes, including fruit and vegetable intake (measured via self-report and the Veggie Meter (objective measure assessing skin carotenoids)), nutrition security, and child involvement in meal planning and preparation. One-sided paired *t*-tests were used to evaluate program effectiveness.

SHORT ORALS

Results: A total of 7 adult-child dyads were enrolled, with 6 completing the program (85.7% retention). Adults were female (100.0%), with a mean age of 47.3 years (SD 14.8), majority non-Hispanic White (50.0%), non-Hispanic Black (33.3%), and Hispanic-White (16.7%). Youth were majority male (66.7%), with a mean age of 10.8 years (SD 1.2). Adults unanimously agreed (100.0%) that receiving a produce box helped their family eat healthier. Nutrition security status ($p<0.01$) and child involvement in meal planning ($p<0.01$) significantly improved. Child BMI-for-age percentile did not change. Adult BMI decreased by -6.9 (T1= 38.4 (SD 14.0); T2=31.5 (SD 11.7), $p=0.079$), systolic BP decreased by -5.6 (T1= 115.2 (SD 11.7); T2=109.6 (SD 15.9), $p=0.079$), diastolic BP decreased by -1.5 (T1= 70.5 (SD 10.7); T2=69.0 (SD 10.3), $p=0.248$), and skin carotenoid scores decreased by -35.7 (T1= 247.0 (SD 46.2); T2=211.3 (SD 42.9), $p=0.496$), but not significantly. HbA1C levels (all participants) increased by 0.1 (T1= 5.5 (SD 0.3); T2=5.6 (SD 0.4), $p=0.253$), but not significantly.

Conclusion: These findings support the scalability of the PhytoRx Families produce prescription program in potentially improving health and diet among rural, underserved families in eastern NC.

Co-creating Adolescent Nutrition and Physical Activity Solutions in the Galapagos Islands of Ecuador through a Human-centered Approach

S.L. Martin¹, I. Headley¹, E.A. Meza Viera², D. Moreta³, A. Wisniewski⁴, M.B. Ocampo Ordóñez², H.M. Wasser¹, A.L. Thompson^{4,3,1}

¹University of North Carolina at Chapel Hill, Nutrition, Chapel Hill, United States, ²Universidad San Francisco de Quito, College of Health Sciences, Quito, Ecuador, ³Galapagos Science Center, San Cristobal, Ecuador, ⁴University of North Carolina at Chapel Hill, Anthropology, Chapel Hill, United States

SO.3.25 Children and families: Nurturing Growth: Early Determinants, Family Interventions, and Youth Lifestyle Patterns

Auditorium, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Adolescence is a critical period for shaping lifelong nutrition and physical activity behaviors and later health outcomes. In the Galapagos, adolescents face multiple barriers to healthy eating and physical activity, and nearly 40% are overweight or obese. This study applied a human-centered design (HCD) approach to engage adolescents and their parents as co-designers in developing feasible, contextually appropriate strategies to promote healthier diets and physical activity.

Methods: We conducted formative qualitative research using an HCD approach in San Cristóbal, Galapagos. Key informant interviews with teachers, school administrators, health workers, and community stakeholders explored challenges adolescents face in maintaining healthy diets and physical activity and identified existing programs and opportunities for intervention. Findings informed a participatory HCD workshop with adolescents and their parents. Parallel adolescent and parent sessions used activities such as “vote with your feet,” journey mapping, and a design challenge to generate ideas for interventions, followed by a joint session for intervention prioritization. A subset of adolescents participated in a photovoice activity to document their diets and food environments. Data from interviews, workshops, and photovoice were analyzed thematically to synthesize participants’ proposed and prioritized intervention ideas.

Results: We conducted seven key informant interviews and facilitated a participatory workshop with 12 adolescents (6 boys, 6 girls; mean age 14.7 years) and 11 mothers. Participants identified opportunities for intervention at schools and within families. At the school level, suggestions included enforcing policies on foods sold at school, training snack bar staff in nutrition, enhancing nutrition education, creating student-led nutrition clubs, and increasing after-school sports programs. Within families, participants proposed workshops to help adolescents prepare healthy meals with their parents and recommended support groups for parents to support adolescent health and nutrition at home. Participants also emphasized the potential of social media and digital tools to share recipes and create short videos featuring simple, affordable dishes using foods available in the Galapagos.

Conclusion: This study demonstrates the value of HCD approaches for advancing behavioral nutrition research and practice. By centering adolescents’ and families’ priorities, participatory methods can generate practical, community-grounded strategies for promoting healthy behaviors in small island settings.

Prevention of Obesity among Adults: Evidence- and Consensus-based Guideline

P. von Philipsborn^{1,2}, M. Bahlke³, C. Breidenassel⁴, C. Holzapfel⁵, C. Joisten⁶, S. Plachta-Danielzik⁷, M. Nothacker⁸, D. Rubin⁹, M. Rung-Friebe¹⁰, M. de Zwaan¹¹, H. Hauner⁵

¹University of Bayreuth, Chair of Public Health Nutrition, Bayreuth, Germany, ²LMU Munich, Chair of Public Health and Health Services Research, Munich, Germany, ³Adipositaschirurgie-Selbsthilfe Deutschland e.V., Frankfurt am Main, Germany, ⁴German Nutrition Society (DGE), Bonn, Germany, ⁵Technical University Munich, Institute for Nutritional Medicine, Munich, Germany, ⁶German Sport University Cologne, Department for Physical Activity in Public Health, Cologne, Germany, ⁷Kompetenznetz Adipositas, Kiel, Germany, ⁸German Association of Medical and Scientific Societies (AWMF), Berlin, Germany, ⁹Vivantes Humboldt-Klinikum, Centre for Nutritional Medicine and Diabetology, Berlin, Germany, ¹⁰Adipositas Verband Deutschland e.V., Bottrop, Germany, ¹¹Hannover Medical School, Department of Psychosomatic Medicine and Psychotherapy, Hannover, Germany

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The global prevalence of obesity continues to rise, highlighting the need for evidence-based guidance on prevention. However, most existing obesity guidelines primarily address treatment rather than prevention. We therefore aimed to develop an evidence- and consensus-based guideline for the prevention of obesity among adults.

Methods: We followed international best-practice standards for guideline development as recommended by the AGREE II tool and the Guidelines International Network (GIN) McMaster Guideline Development Checklist. We systematically searched for relevant systematic reviews and existing guidelines up to March 2024, and conducted a structured consensus process involving 34 experts, including 5 patient representatives. We used GRADE to assess the certainty of evidence, and to grade the strength of recommendations. The guideline was developed under the auspices of the German Obesity Society as its official guideline, and primarily targets the adult population in Germany, but many recommendations are likely to be relevant internationally.

Results: The guideline comprises 24 recommendations addressing the general public, healthcare professionals, and policymakers. The certainty of evidence ranged from very low to high, and was rated to be moderate or high for most key recommendations. The degree of consensus was above 90% for all except one recommendation. Key recommendations include adherence to a healthy diet consistent with existing food-based dietary guidelines, regular physical activity, and adequate sleep and stress management. Smoking cessation is recommended even if accompanied by weight gain. The guideline suggests offering qualified dietary and physical activity counselling in primary care and considering potential weight effects when prescribing medications. Moreover, it recommends implementing evidence-informed policies to create supportive food and physical activity environments. Further, specific recommendations address plant-based diets, extremely restricted diets, ultra-processed foods, non-nutritive sweeteners, alcoholic beverages, the use of dietary supplements and other non-evidence-based weight management methods, macronutrient intake shares, patterns of food intake over the day, self-monitoring, and sedentary behaviour, among others.

Conclusion: Evidence-based strategies for preventing obesity at both individual and societal levels are available and should be implemented more systematically to curb the growing obesity epidemic.

Politics a Roadblock for Public Transport: Policy Barriers to Creating Environments that Support Active Living

M. Sharman¹, M. McLaughlin², P. McCue³, T. Washington⁴, V. Cleland¹, K. Jose⁵

¹University of Tasmania, Hobart, Australia, ²University of Western Australia, Perth, Australia, ³University of New South Wales, Sydney, Australia, ⁴Queensland University of Technology, Brisbane, Australia, ⁵University of Tasmania, Menzies Institute for Medical Research., Tasmania, Australia

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

SHORT ORALS

Purpose: Public transport is a potential ‘stealth’ strategy for increasing physical activity, with users more active than non-users. Yet in countries like Australia, less than 5% of work commuters use public transport. Smaller and regional Australian states like Tasmania have even lower usage, and the lowest investment per capita in Australia. Subnational government policy plays a critical role in shaping public transport, but little is known about barriers to supportive policy. Given the health, environmental, and economic benefits, this study aimed to identify policy barriers to public transport in Tasmania, Australia.

Methods: Semi-structured interviews were conducted (2024-25) with experienced policymakers from Tasmanian government and non-government sectors. Questions focused on policy experience, enablers and barriers, and perspectives on Tasmanian policy related to public and active transport. Verbatim transcriptions were thematically analysed, underpinned by the Comprehensive Analysis of Policy on Physical Activity framework, and using a constant comparative approach.

Results: Participants (n=16) were age >40 years, 50% women, and had an average of 22 years’ experience. There was clear recognition of the importance of public transport for multiple reasons: *‘Affordable public transport, less traffic, cleaner air, healthier lives – what’s not to love?’*. Despite this, ‘politics’ was articulated as a key barrier to better public transport: *‘Tasmania could have it all, but political games are blocking the journey’*, *‘...Tasmania deserves better, not more political detours’*, *‘Want less traffic, cheaper commutes, fresher air, and fitter communities? Tasmania could, if politicians stopped spinning their wheels’*; and *‘Public transport shouldn’t be a political tug-of-war’*. Evidence was seen as important but was often devalued: *‘...it’s much more about people outside the system and their ability to persuade governments that something will be popular, than it is people within the system with a comprehensive evidence base trying to persuade governments this is the right thing to do’*.

Conclusion: Despite recognition of the health and environmental benefits of public transport, political barriers are seen as key obstructions to supportive policy. Presenting evidence of benefits of public transport alone is unlikely to be sufficient to change policy, without a dedicated focus on collective advocacy to counteract opposing voices.

SO.3.26-03

Commercial Determinants of Active Travel: A Crucial but Overlooked Barrier to Health and Sustainability

S. Kahlmeier¹, J. Bucksch², K. Abu-Omar³, D. Baltruks⁴, A. Bauman⁵, D. Ding⁵, L. Paulsen², L. Reismann⁶, B. Wallmann-Sperlich⁷, C. Jochem⁶

¹City Health, Zurich, Switzerland, ²Heidelberg University of Education, Prevention and Health Promotion, Heidelberg, Germany, ³Friedrich-Alexander-Universität Erlangen-Nürnberg, Sport Science an Sport, Nuremberg, Germany, ⁴German Alliance on Climate Change and Health, Centre for Planetary Health Policy (CPHP), Berlin, Germany, ⁵University of Sydney, School of Public Health, Faculty of Medicine and Health, Sydney, Australia, ⁶University of Bayreuth, Planetary and Public Health, Bayreuth, Germany, ⁷Julius-Maximilian University of Würzburg, Integrative and Experimental Exercise Science and Training, Institute for Sports Science, Faculty of Human Science, Würzburg, Germany

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Active travel is a key contributor to both health and sustainability. It improves physical and mental health, reduces greenhouse gas emissions and air pollution, and offers social and economic benefits. However, active travel remains considerably underutilised in many countries. Understanding its determinants is important to guide effective interventions. Commercial determinants are important yet overlooked. While growing evidence suggests the role of commercial actors in shaping health behaviours, their impact on active travel has rarely been considered. We aim to advance the discourse on the commercial determinants of active travel by outlining positive and negative examples and actions to researchers, decision makers and planners to counteract commercial determinants of active travel.

Methods: Commercial determinants of active travel describe the influence of economic interests on encouraging and discouraging active mobility choices. Commercial determinants of active travel operate through systemic influences on urban and community planning, transportation planning, corporate interests, public discourse and policy making. Through strategic scanning of recent relevant literature, we developed a framework of key commercial strategies and approaches.

Results: We will present a range of counter-marketing strategies (e.g., political lobbying, promotion, advocacy and advertising, suppression of alternatives) to influence active travel and give positive (e.g. bicycle or walking coalitions lobbying) and negative examples (e.g. car industry lobbying for road expansion or reduced fuel taxes) for each strategy. We will also present case studies to illustrate key strategies.

SHORT ORALS

Conclusion: Recognizing, disseminating and addressing commercial determinants of active travel is essential for improving population and planetary health. Future work should include accountability frameworks, honing of more forceful advocacy, and allocation of considerable funding for policy-oriented research to better understand and effectively engage decision-makers and practitioners in promoting active travel.

SO.3.26-04

Prevalence of Ultra-processed Foods without Front-of-Pack Nutrition Labeling in Brazil: Implications for Informed Food Choices

C. Kikuta¹, M.T. Oliveira Tomiya¹, A.P. Bortoletto Martins¹

¹University of São Paulo, Faculty of Public Health, São Paulo, Brazil

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: To investigate the prevalence of ultra-processed foods in Brazil without front-of-pack nutrition labeling (FOPNL), emphasizing how missing information may hinder informed food choices and nutrition awareness.

Methods: A cross-sectional study was conducted using data from Mintel-GNPD, a commercial secondary database that compiles information on newly launched food products marketed in Brazil. A total of 23,587 products launched between October 2022 and September 2025 were analyzed. Of these, 22,238 met the criteria for inclusion in front-of-pack nutrition labeling (FOPNL) food groups. The regulatory nutrient thresholds for FOPNL were applied to these products (n = 15,453) for each nutrient. Subsequently, products displaying FOPNL were identified through the variable “product description”, by searching for the textual terms “HIGH IN SODIUM,” “HIGH IN SATURATED FATS,” and “HIGH IN ADDED SUGARS,” including their variations and combinations, using regular expression commands. Unprocessed and minimally processed foods were excluded because they are not allowed to receive front-of-pack nutrition labeling. All analyses were performed using Stata/SE version 16.1.

Results: Products that fell within the established thresholds for each critical nutrient were evaluated. Among the products not exceeding the sodium threshold, 80% were ultra-processed, 17.5% were processed, and 2% were culinary ingredients. For products not exceeding the added sugar threshold, 75.7% were ultra-processed, 21.5% were processed, and 2.7% were culinary ingredients. Among products not exceeding the saturated fat threshold, 75.9% were ultra-processed, 22% were processed, and 2% were culinary ingredients.

Conclusion:

Considering the results, the prevalence of ultra-processed foods that do not meet the thresholds to receive FOPNL is higher than that of processed foods and culinary ingredients, which is concerning since these products are associated with negative health effects. The absence of FOPNL on the majority of ultra-processed products available in Brazil may limit consumers’ access to clear and objective information about their nutritional profiles. This scenario may hinder individuals’ ability to make autonomous and informed food choices, reinforcing the importance of strengthening labeling regulations as a tool to promote healthier eating practices.

SO.3.26-05

Emerging Behavioural Insights on Dietary Sodium Reduction from a National Survey of Canadians Adults

R. Al Ghali¹, K. Jefferson¹, J. Arcand¹

¹Ontario Tech University, Oshawa, Canada

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: High sodium intake remains a major contributor to hypertension and cardiovascular disease in Canada. Yet, it has been over a decade since the cognitive, behavioural, and environmental determinants of sodium intake were last assessed. The objective of this study was to examine the behavioural determinants of sodium intake in a national cohort of Canadians.

Methods: A cross-sectional online survey of adults aged ≥18 years (n=3,236) was conducted in 2024 using the

SHORT ORALS

Behavioural Assessment Instrument for dietary Sodium. Participants were recruited by Leger Marketing. The survey assessed sodium-related determinants including social and environmental influences, perceptions, knowledge and behaviours using 5-point Likert-scale questions. Responses were regrouped as “agree/strongly agree,” “neutral,” “disagree/strongly disagree,” or as “yes/no” where applicable. Weighted analyses were aligned with the 2021 Canadian Census. Associations between categorical variables were examined using Rao–Scott χ^2 statistics; two-sided $p < 0.05$ considered statistically significant.

Results: Overall, 42% of participants reported actively limiting sodium, with no sex difference but lower rates among younger groups ($p < 0.001$). Most participants (78%) reported taking steps to reduce sodium, increasing with age. Concern about sodium was expressed by 64%, and half viewed reduction as personally important. Packaged foods (35%) and salt added during cooking (20%) were identified as the main perceived dietary sodium sources. Hedonic influences remained strong: 59% agreed sodium enhances taste, 44% reported salty-food cravings, and 32% used salty foods for comfort; all declining with age ($p < 0.001$). Only 22% received encouragement from family/friends, while 57% ignored sodium content when dining socially. Environmental barriers were prevalent, with 73% citing limited low-sodium options in fast-food settings. Interestingly, front-of-package nutrition labels influenced purchase intentions: 54% were unlikely to buy products “high in fat and sugar,” 46% “high in sodium,” and 43% “high in fat and sodium,” with females and older adults more responsive ($p < 0.05$). When comparing nutrition labels, 34% selected the lower-sodium product and 30% chose the perceived healthier option.

Conclusion: These findings highlight emerging behavioural, environmental and social influences on sodium intake in Canada. Translating these insights into targeted, equity-oriented policies will be key to advancing progress toward national sodium-reduction goals within today’s changing food environments.

SO.3.26-06

Association between a State-mandated Policy on Recess Trends, and Recess Impact on Obesity Prevalence in Elementary Schools: Does School Physical Activity Environment Moderate These Relationships?

S. Raval¹, F. Acciai¹, A. Poulos², P. Ohri-Vachaspati²

¹Arizona State University, Phoenix, United States, ²ASU, Phoenix, United States

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Only 20% of youth aged 6-17 years achieve the recommended 60 minutes of daily physical activity (PA). Schools are a crucial setting for increasing PA opportunities among children. In school year (SY) 2018-19, New Jersey implemented a statewide policy mandating at least 20 minutes of daily recess in elementary schools. This study examined (1) school compliance with recess policy, (2) the association between recess frequency and school-level obesity prevalence, and (3) whether school PA facilities (e.g., playgrounds, gymnasiums) moderated this association.

Methods: Data on recess frequency (SYs 2010-11 to 2023-24) and school PA facilities were collected from elementary schools (total 827 observations) in New Jersey. Nurse-measured heights and weights were used to estimate school-level obesity prevalence. Trends in recess provision were analyzed using an interrupted time series approach, comparing pre-policy (SY 2010-11 to SY 2017-18) to post-policy years (SY 2018-19 to SY 2023-24). Mixed-effects logistic regression models examined the association between recess frequency and obesity. Interaction term with school PA facilities was added to both models to assess if school PA facilities modified these associations. All models controlled for key school-level factors and adjusted for repeated observations of schools over time.

Results: A significant upward shift in recess provision occurred immediately following the policy implementation. Assuming the significant negative pre-policy trend ($\beta = -0.097$, $p = 0.006$), we would have expected the average number of weekly recess days in 2018 to be 3.4 days; instead, it was significantly higher, at 4.3 days ($p = 0.001$). The post-policy trend was approximately flat ($\beta = 0.016$, $p = 0.746$). The moderating effect of the number of PA facilities was marginally significant post-policy suggesting that schools with higher number of PA facilities offered recess on more days compared to those having fewer facilities (3.9 vs 4.4 days). No significant association was observed between daily recess frequency and school-level obesity prevalence, regardless of the total number of school PA facilities.

Conclusion: The 2018 NJ recess policy was associated with increased recess frequency. Schools with more PA facilities were more likely to be compliant, highlighting the importance of supportive physical environments in implementing school-based PA policies.

SHORT ORALS

SO.3.26-07

Dietary Diversity, Food Insecurity and Self-efficacy for Meal Management during the COVID-19 Pandemic in Mauritius

K.E. Markwell^{1,2}, S.A. Dillon^{2,3}, I. Ukonu², D. Ramful-Baboolall⁴, C.A. Wallace^{3,2}¹University of Leeds, School of Food Science and Nutrition, Leeds, United Kingdom, ²University of Lancashire, School of Health, Social Work and Sport, Preston, United Kingdom, ³University of Lancashire, Institute for Planetary Resilience and Community Transformation (PACT), Preston, United Kingdom, ⁴University of Mauritius, Department of Agricultural and Food Science, Reduit, Mauritius

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Globally the COVID-19 pandemic affected food security and food access. This is the first exploration of impacts on diet by COVID-19 lockdowns Mauritius and the first to explore self-efficacy for meal management (SEMM) with respect to lockdown dietary behaviours. This study also aimed collect other insights for dietary interventions using novel attitude statements.**Methods:** 312 Mauritian adults completed a cross-sectional retrospective questionnaire after COVID-safe (CS) and COVID lockdown (CL) periods. Demographics and measures of Household Food Insecurity Access Scale v3 (FI), Dietary Diversity Score Questionnaire (DD), and SEMM were collected, each twice to compare periods. Dietary practice, attitude, and consumption (DPAC) statements on food topics were collected with Likert scales. All analyses were run in IBM SPSS v29.0. There were 291 cases post cleaning. Chi square tests were run between demographics and categorical DD and FI for both periods. DD, FI and SEMM were not normally distributed using Kolmogorov-Smirnov tests. Wilcoxon Signed-Rank Tests were run between DD, FI and SEMM to compare periods. Spearman correlations assessed relationships between the different variables. DPAC scores were categorised into topics and multiple linear regression analyses (set to $p < .001$) and analysed with DD and FI scores for both periods.**Results:** FI during CL was significantly higher ($z = -3.737$, $p < .001$) and DD was significantly higher in CS ($z = -4.342$, $p < .001$). During CS periods a significant negative association was identified between DD and FI ($r_s(242) = -.291$, $p < .001$), not observed during CL ($r_s(242) = -1.03$, $p = 0.10$) indicating disruption. A higher SEMM was associated with lower FI during CL periods ($r_s(267) = -.254$, $p < .001$). DPAC categories found positive attitudes towards locally grown food, growing own crops, cooking confidence and food variety.**Conclusion:** Mauritian consumers' food insecurity and dietary diversity was impacted by lockdowns and usual patterns appeared disrupted. The observed relationship between SEMM and food security needs further substantiation as this could be modifiable factor for health improvement. Attitude statements identified elements that may be useful for food security interventions and warrant further investigation. This study gives insights that may benefit health promotion efforts for future food crises.

SO.3.26-09

Healthcare Costs Attributable to Physical Inactivity and Unhealthy Diets in Thailand's Universal Coverage Scheme

K. Akksilp^{1,2}, A. Rodphat¹, P. Jammor¹, S. Suriyasangsri¹, C. Chen³, Y. Teerawattananon¹¹Health Intervention and Technology Assessment Program Foundation, Nonthaburi, Thailand, ²Institute of Medical Research and Technology Assessment, Nonthaburi, Thailand, ³Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: To quantify healthcare costs attributable to physical inactivity and key dietary-related risk factors among beneficiaries of Thailand's Universal Coverage Scheme, using harmonized exposure, relative risk, and routine claims data. Specifically, we estimate cause-specific and joint-attributable costs across multiple Non-Communicable Diseases and population subgroups to inform fiscal, regulatory, and prevention policies.**Methods:** We calculated population attributable fractions (PAFs) using exposure prevalence from the National Statistical Office health survey (2021) for three modifiable risks: physical inactivity (<750 MET-min/week), high processed meat intake (50 g/day), and sugar-sweetened beverage consumption (≥ 1 serving/day). Relative risks of

SHORT ORALS

risk-outcome pairs were derived from meta-analyses of prospective cohort studies and cross-checked with Global Burden of Disease estimates. Cause-specific PAFs were applied to individual-level inpatient expenditure data from the National Health Security Office database (2024) to estimate attributable healthcare costs.

Results: From the National Statistical Office survey, an estimated 46-48% of Thai population had low physical activity, ~20% reported high processed meat intake, and 74-81% consumed at least one serving of sugar-sweetened beverages per day. In 2024, inpatient costs attributable to low physical activity across coronary heart disease, stroke, type-2 diabetes, hypertension, breast and colon cancer, renal cancer, dementia, and depression were \$22.7 million (95%UI 12.0-32.5), accounting for 7.2% of Universal Coverage Scheme spending on these conditions. High processed meat intake contributed \$11.6 million (95%UI 6.28-17.3), or 3.6% of relevant expenditures, via type-2 diabetes, chronic kidney disease, colorectal cancer, ischemic heart disease, and stroke. Daily sugar-sweetened beverage consumption accounted for \$26.2 million (95%UI 12.3-38.7), representing 15.4% of costs for type-2 diabetes, ischemic heart disease, stroke, gout, and prostate cancer. Attributable costs showed clear variation across provinces, highlighting geographic inequities and opportunities for more targeted, context-specific Non-Communicable Diseases prevention policies.

Conclusion: Physical inactivity and unhealthy diets generate a measurable and preventable inpatient cost burden within Thailand's Universal Coverage Scheme, with impacts unevenly distributed across population groups and provinces. By integrating national exposure data, meta-analytic effect estimates, and routine claims data, this analysis provides policy-ready estimates to guide targeted NCD prevention, fiscal and regulatory action, and more efficient resource allocation. Future work should extend to outpatient care and other financing schemes.

SO.3.26-10

Exploring Physical Activity Context of Rural Primary Care Clinic Communities in the PA Moves Trial

M.R. Umstattd Meyer¹, S.J. Werts-Pelter², S.E. Doerksen², J. Vigil¹, A. Vincent², O. Bickus², C. Desroches², M.D. Sobolewski², S.M. West², R. Celebre², M. Ahmed², S. Baker², R. Scalise², M.T. Ruffin IV³, K.H. Schmitz²

¹Baylor University, Robbins College of Health and Human Sciences, Department of Public Health, Waco, United States,

²University of Pittsburgh School of Medicine, UPMC Hillman Cancer Center, Division of Hematology Oncology, Pittsburgh, United States, ³Penn State University, Hershey Medical Center, Department of Family and Community Medicine, Hershey, United States

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Approximately 20% of the U.S. population resides in rural communities. Although increased physical activity (PA) is associated with reduced risk of multiple chronic diseases, including cancer, rural populations consistently report lower levels of PA compared to their urban counterparts. PA Moves is a NIH-supported cluster randomized controlled trial designed to address health disparities for patients of rural primary care providers (PCP) by promoting PA as a strategy to reduce cancer risk. Given the importance of environment, policy, and programming contexts for PA behavior, PCP clinic communities' PA opportunities and supports were assessed and will be described during this presentation.

Methods: The Rural Active Living Assessment (RALA) tools were used to assess PA contextual factors of the nine PA Moves intervention clinic communities; all located in rural Pennsylvania. Google Maps was used to identify town centers, PA resources and amenities (e.g., parks, trails, courts), and street segments. RALA townwide and segment assessments were completed using ground-truthing by trained research staff. Structured phone interviews were conducted with community leaders to describe PA policies, programs, and opportunities.

Results: Clinic communities represent rural variability, ranging in rural designation (RUCA-2020: 4.0-10.0) and tract level population density (48.5-2,580 people/tract). Street segments were assessed for town center, thoroughfare, school, and residential areas for each community (average=15/community). PA resources and amenities within 5-miles of town centers were identified and assessed, including parks, trails, courts/fields, community centers, other recreational amenities (e.g., hockey rinks, swimming pools), private fitness facilities, and school amenities. PA resources were present in all nine clinic communities, although the quantity and quality of available PA resources varied. PA supports and opportunities for clinic communities will be described during this presentation using RALA scores.

Conclusion: While PA resource context varies by rurality, with more rural areas often having fewer resources, high quality PA resources are available within 5-miles of these clinic communities. Future research should combine ground-truthed assessments of PA context and community members' perceptions to better understand accessibility. Health promotion efforts should increase awareness and utilization of existing high quality community resources,

SHORT ORALS

while advocating for maintenance of existing resources and solutions for PA resource deserts.

SO.3.26-11

Heat and Air Pollution Exposures during the School Day: Temporal and Seasonal Patterns across 19 Schools in Hot, Semi-arid Climates

K. Wilson¹, M. Faraji², A. Lowe³, N. Mottern⁴, N. Shepp⁵, K. Wilhelmsen⁵, A. Lee⁵, M. Draper⁵, C. Lim²

¹University of Arizona Cancer Center, Tucson, United States, ²University of Arizona, Mel and Enid Zuckerman College of Public Health, Tucson, United States, ³University of Arizona, Nursing and Health Sciences Division, College of Nursing; Asthma & Airway Disease Research Center, University of Arizona Health Sciences, Tucson, United States, ⁴University of Arizona, Asthma & Airway Disease Research Center, University of Arizona Health Sciences, Tucson, United States, ⁵Pima County Department of Environmental Quality, Tucson, United States

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Children are particularly vulnerable to environmental stressors like heat and air pollution due to their developmental stage, higher ventilation rates, frequent outdoor activity, and often limited adaptive capacity. Particulate matter (PM), especially PM_{2.5}, poses significant health concerns, yet few studies have examined exposure to heat and PM during school hours. We aimed to (1) characterize temporal and seasonal patterns of heat and PM across K-12 schools in Southern Arizona, USA (hot desert, semi-arid climates), and (2) examine differences based on sociodemographic factors.

Methods: We conducted a longitudinal observational study using data from 19 schools (2023-2025). Temperature, PM_{2.5}, and PM₁₀ were measured via rooftop QUANTAQ (MODULAIR) sensors. Hourly data were aggregated into school-relevant intervals: Early Morning (5-7AM), Morning (7-10AM), Mid-Morning (10AM-12PM), Afternoon (12-3PM), Mid-Afternoon (3-5PM), Evening (5-7PM), and Overnight (7PM-5AM). Seasons were defined meteorologically, and proportions of hourly observations above thresholds were calculated relative to >32.2°C for heat, PM_{2.5} >15µg/m³, and PM₁₀ >150µg/m³. Sociodemographic factors included school-level income (binary), asthma prevalence, household income, diesel PM exposure, toxic releases to air, and traffic proximity. Mean above-threshold proportions from 7AM-5PM were compared across sociodemographic factors using *t*-tests (binary) or ANOVAs (categorical).

Results: On average across schools, the above-threshold proportion of observations for PM₁₀ were highest in the morning and mid-morning periods (~1-2%), especially in fall and winter. PM_{2.5} above-threshold proportions were generally low, though winter mornings reached ~4-10%. Extreme heat was most pronounced in summer, beginning mid-morning and persisting through afternoon, with up to 98% of average hourly observations >32.2°C; above-threshold proportions were moderate in spring (~50% mid-afternoon) and minimal in fall and winter. Lower-income schools experienced higher mean above-threshold proportions for PM_{2.5} compared to more affluent schools (3.1±3.7% vs. 1.2±1.0%; *p*=0.002). No significant differences were observed for PM₁₀ or heat proportions, and other sociodemographic factors were not consistently associated with the proportion of observations above thresholds.

Conclusion: Generally, mornings and early afternoons represent the highest-risk periods for PM and heat exposure. Greater PM_{2.5} exposures in lower-income schools suggest environmental disparities. Understanding these patterns can guide safe outdoor activity and interventions to mitigate exposure risks while keeping children safe during play.

SO.3.26-12

Improving Walkability in Rural Australian Towns: Citizen Scientists Identify Investment in Pedestrian Infrastructure as Key to Enhancing Safety and Connectivity

K. Jose¹, C. Morley², G. Mc Grath¹, M. Davern³, A. Timperio⁴, Y. Laird⁵, S. Rowbotham⁶, K. Garvey⁷, V. Cleland¹

¹University of Tasmania, Menzies Institute for Medical Research, Hobart, Australia, ²University of Tasmania, School of Nursing, Hobart, Australia, ³RMIT University, Centre for Urban Research, Melbourne, Australia, ⁴Deakin University, Institute for Physical Activity and Nutrition, School of Exercise & Nutrition Sciences, Melbourne, Australia, ⁵The University of Sydney, Prevention Research Collaboration, Sydney School of Public Health, Sydney, Australia, ⁶Curtin University, Faculty of Health Sciences, Perth, Australia, ⁷Department of Health, Hobart, Australia

SHORT ORALS

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental
Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: There is strong evidence that demonstrates that the physical environment can hinder or support walking. However, research has been urban-oriented, with little attention paid to rural and regional areas, where residents are at high risk for chronic disease and inactivity. This study aimed to identify built and physical environmental and spatial characteristics of small rural towns that influence walkability to identify community priorities for improving walkability.

Methods: This study used a mixed methods approach combining citizen science and spatial assessments of walkability for 92 rural Australian towns in the state of Tasmania with populations less than 6,000. Towns were ranked by geospatially assessed walkability scores and citizen scientists completed walkability audits in each of ten selected towns. Once audits were completed, a community workshop was held to identify priorities for action. Audit data were compiled and analysed descriptively; workshop data and open-ended responses were analysed thematically.

Results: Towns were grouped into low (N = 4), medium (N = 3) and high geospatially assessed walkability (N = 3). A total of 87 citizen scientists across 10 towns participated in the project. Most towns (n=8) had at least 10 of a possible 12 recreational amenities. There was no obvious relationship between geospatially assessed walkability and the number or quality of amenities. Two major attributes were identified using audit and workshop data that negatively impacted actual and perceived walkability: traffic safety and connectivity. These concerns were partly attributable to limited and poorly maintained pedestrian infrastructure. This was reflected in strategies identified by citizen scientists to improve walkability such as lighting, signage, seating, maintenance of existing footpaths and trails, and the creation of new footpaths.

Conclusion: While geospatial data enabled macro-assessment of the built environment it was the micro-scale features that impacted walkability in these rural towns. Maintenance of existing infrastructure and investment in new pedestrian infrastructure is needed to address many of the traffic safety concerns and connectivity challenges in these rural towns. Citizen scientists had a range of practical solutions to strengthen pedestrian infrastructure that would enhance walkability, demonstrating the value of citizen-led approaches to inform planning and rural health promotion.

SO.3.26-13

Prospective Associations of Objective Neighborhood Environment with Long-term Changes in Physical Activity among Children, Adolescents, Adults, and Older Adults

A. Oyeyemi¹, M. Adams¹, T. Conway², K. Cain², M. Todd³, J. Carlson⁴, L. Frank², K. Glanz⁵, A.C King⁶, B. Saelens⁷, J. Sallis²

¹Arizona State University, College of Health Solutions, Phoenix, United States, ²University of California, San Diego, United States, ³Arizona State University, Edson College of Nursing and Health Innovation, Phoenix, United States, ⁴Children's Mercy Hospital, Kansas City, United States, ⁵University of Pennsylvania, Philadelphia, United States, ⁶Stanford University School of Medicine, Palo Alto, United States, ⁷University of Washington, Seattle, United States

SO.3.26 Policies and environments: Shaping Healthy Choices: Nutrition, Physical Activity, and Health Environmental
Room 1, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The health benefits of physical activity (PA) in all age groups are well established. Cross-sectional studies show positive associations between macro-scale “activity-supportive” neighborhood environmental features (i.e., ‘walkability’, ‘playability’, transit accessibility) and PA. Although evidence from prospective studies supports cross-sectional findings, critical limitations exist. Many prospective studies used short follow-up periods focusing on single age groups, precluding examination of longer-term impacts of neighborhood environments and generalizability across age groups. The present study examines how objective “activity-supportive” neighborhood environmental features are associated with long-term (5.1- to 15-year) changes in accelerometer-measured moderate-to-vigorous PA (MVPA) and self-reported transport-PA across four age groups. Our hypothesis is that higher objective “activity-supportiveness” of neighborhood environment is associated with less decline in total MVPA and transport-PA across all age groups.

Methods: This secondary analysis leverages data from four age-group-specific studies (NIK (children), TEAN (adolescents), NQLS (adults), and SNQLS (seniors) conducted in the San Diego, Seattle, and Baltimore regions of the US. A 5th study (SAFE) provided long-term follow-up assessments by re-recruiting 1067 participants (NIK=262, TEAN=163, NQLS=430, SNQLS=212). All studies, except NIK, used a 2 (high/low walkability) x 2 (high/low income)

SHORT ORALS

sampling design to balance variability in built environments and neighborhood income. Participants wore ActiGraph accelerometers for seven consecutive days to measure MVPA. Transport-PA was self-reported. GIS measures (1-km buffer around participants' residential address) included: 'walkability index' calculated as area-normalized z-scores of four objective environmental features (residential density, land use mix, street connectivity, and retail floor area ratio), counts of parks, and transit stop density (stops/km²). Longitudinal structural equation path models (SEMs) adjusting for covariates (age, sex, education, race/ethnicity, mover status, etc.) are being used to examine the prospective associations of objective neighborhood "activity-supportiveness" (exposures) at baseline with 5-15 year changes in MVPA and transport-PA. Moderating effects of age group on associations of exposures with change in MVPA and transport-PA are being tested using a multigroup SEM framework.

Results: We are finalizing data analysis and will have all study results by January/February 2026.

Conclusion: The findings will provide evidence crucial for understanding how objective "activity-supportive" neighborhood environment features may explain long-term changes in PA at different points across the lifespan.

SO.3.27-01

Understanding Adult's Experiences and Perceptions of How to Maintain Physical Activity: A Systematic Review and Qualitative Synthesis Using Thematic Analysis

C. Madigan¹, A. Daley¹, H. Graham¹, S. Sweet², C. Grimmatt³

¹Loughborough University, School of Sport Exercise Health Sciences, Loughborough, United Kingdom, ²McGill University, Department of Kinesiology and Physical Education, Montreal, Canada, ³University of Southampton, Centre for Psychosocial Research in Cancer, Southampton, United Kingdom

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Most research focuses on initiating physical activity. However, helping and encouraging people to maintain this physical activity in the long-term (i.e., physical activity maintenance) is equally as important to sustain improvement in health. There are very few intervention studies that have tested physical activity maintenance interventions. Thus the aim of this research was to synthesise data about qualitative findings to identify factors that could be targeted in future interventions.

Methods: A systematic review and qualitative synthesis using thematic analysis was conducted. Four databases (Medline, SPORT Discus, APA, and Web of Science) were systematically searched for studies published from inception to February 2023 that included qualitative data about people's experiences of maintaining physical activity. Qualitative studies with adult participants (≥18 years) that reported data about people's experience of maintaining physical activity were included. Individual quotes were taken from the data and thematically analysed using Nvivo.

Results: A total of 9,337 abstracts were screened and 68 studies from 14 countries were included. Six main themes were identified: 1. Influence of others (e.g., four forms of social support, accountability) 2. Contextual and Environmental influences (e.g., cost and access of physical activity, weather) 3. Health related influences (e.g., reflexivity about how physical activity improves health conditions, weight control) 4. Making it work (e.g., flexibility, prioritising exercise), 5. Habits and 6. Psychological processes (e.g., enjoyment, identifying as a physically active person).

Conclusion: Our findings suggest that some of the common variables reported for physical activity initiation continue to be important for maintenance. These include social support, particularly in the form of companionship, and activities that are enjoyable to people. However, to promote maintenance, interventions may need to focus on unique factors such as reflexivity of the health benefits, flexibility, prioritisation and helping people identify as a physically active person. When people recognise the multiple benefits to their health that physical activity offers, they are motivated to continue to experience these and consequently strive to maintain a physically active lifestyle. These components should be included and tested in interventions.

SHORT ORALS

SO.3.27-02

Using Ambulatory Measures to Identify Modifiable Predictors of Cognition in Systemic Lupus Erythematosus

C.-C. Lin¹, A. Kratz¹, D. Whibley¹, D. Kinnett-Hopkins¹

¹University of Michigan, Ann Arbor, United States

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Systemic Lupus Erythematosus (SLE) is a chronic autoimmune disease characterized by fatigue, pain, sleep disturbance, and depressed mood, which can affect cognitive function. However, it remains unclear which symptoms have the greatest impact on cognitive function. To address this gap, we utilized ecological momentary assessments (EMA) to capture real-time data on somatic (fatigue, pain), mood (depression) symptoms, sleep (quality and duration), and cognitive function. Our goal was to identify modifiable symptoms that predict same-day changes in cognitive function.

Methods: Participants with SLE attended a lab visit for self-report measures, cognitive testing, and performance-based physical functioning measures. A two-week home monitoring period followed, where participants were given a study-specific smartphone (with a data collection app) for collection of ambulatory data. Participants reported sleep duration and sleep quality each morning and completed EMA measures of fatigue, pain intensity, depressed mood, perceived and objective cognitive function at 4 daily intervals (wake, midday, afternoon/evening, bedtime) via smartphone app. Multilevel random-effects models examined within-person associations between symptoms/sleep and cognitive function, controlling for demographic and between-person effects of the same time-varying variable.

Results: Seventeen women diagnosed with SLE (mean age: 49.5±7.2 years; 7 Black/10 White; disease duration: 15.3±9.1 years; Systemic Lupus Activity Measure: 16.4±8.5; BMI: 31.5±7.1 kg/m²) were included. At the within-person level, days of higher than usual fatigue ($B = 0.35$, $p < 0.001$), pain ($B = 0.30$, $p < 0.001$), low mood ($B = 0.15$, $p < 0.001$), and stress ($B = 0.15$, $p < 0.001$) were significantly associated with higher same-day perceived cognitive dysfunction. In addition, nights of better sleep duration or quality were followed by days of better perceived cognitive function. No significant associations were observed between any symptoms and objective cognitive performance.

Conclusion: Daily fluctuations in fatigue, pain, mood, stress and sleep were significantly associated with perceived cognitive dysfunction. Of SLE symptoms assessed, pain and fatigue demonstrated minimal to moderate clinically important effects on perceived cognitive function. However, these symptoms did not relate to objective cognitive performance. These findings highlight the importance of considering daily symptom experiences when assessing perceived cognitive function in individuals with SLE. Given the small sample size, results should be interpreted with caution and replicated in larger cohorts.

SO.3.27-03

Motivation as an Engine for Enjoyment and Physical Activity in Personal Training

H. Vieira Pereira¹, A. Aguiar¹, L. Cerca¹, A. Labisa Palmeira¹, D. Teixeira¹

¹Universidade Lusófona de Lisboa, CIDEFES, Lisboa, Portugal

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Self-Determination Theory (SDT) suggests that autonomous motivation enhances psychological (e.g., enjoyment) and behavioural (e.g., physical activity) outcomes. This study assessed motivation's explanatory power, independent of coach style, using BREQ-4, EMI-2, PACES, and self-reported weekly PA in personal training.

Methods: Adults receiving personal training ($N = 125$) completed the BREQ-4, EMI-2, PACES, and PA measures through an online survey. The sample consisted of 58% women; age mean = 46 years, $SD = 14.03$. We calculated scale scores and reliability (Cronbach's α , McDonald's ω), conducted correlation analyses with FDR correction (covariates: age, sex), identified motivational profiles via latent profile analysis (Gaussian mixture, k determined by BIC), and modelled physical activity using HC3-robust OLS and Elastic-Net with nested cross-validation. Additionally, a regression chain consistent with SDT was estimated (EMI-2 and RAI predicting PACES and PA) without testing indirect effects.

SHORT ORALS

Results: Most BREQ-4 and EMI-2 subscales demonstrated acceptable internal consistency. Higher RAI correlated with greater enjoyment and increased PA frequency and duration, while appearance/pressure motives were associated with lower RAI. Multivariable models showed RAI and PACES as primary predictors of PA, with EMI-2 motives (e.g., enjoyment, affiliation) providing additional insight. Elastic-Net confirmed RAI and PACES as key predictors. Motivational profiles differed in enjoyment and PA, with more autonomous profiles reporting higher levels. RAI strongly predicted PACES, which in turn predicted PA, supporting the role of autonomous regulation in enhancing enjoyment and activity.

Conclusion: Motivation significantly predicted psychological and behavioral outcomes in personal training, with autonomous regulation (RAI) playing a key role by enhancing enjoyment and physical activity (PA). EMI-2 motives influenced this relationship upstream. Interventions should focus on fostering self-determined regulation and enjoyment to promote sustainable PA. Future studies should include device-based PA measurements and longitudinal designs to improve causal inference.

SO.3.27-04

Social Norms and Warning Label Responses for Sugary Drinks in Mexican and Mexican American Adults: Data from the International Food Policy Study 2023

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Social norms (SN) are recognized determinants of sugar-sweetened beverage (SSB) consumption. Drinking behaviors often align with norms within culturally relevant groups, yet little is known about how SN surrounding SSBs in social gatherings relate to SSB intake and responses to Mexico's front-of-package warning labels (WL). This study aimed to (1) identify sociodemographic and behavioral factors associated with SN regarding serving SSBs in social events, and (2) examine whether such norms relate to WL-driven changes in cola purchases.

Methods: We analyzed data from the 2023 International Food Policy Study, an online self-administered survey including 2,596 Mexican Americans and 4,651 Mexicans (mean age: 39.6 years; 51.1% female). Analyses incorporated sampling weights and accounted for survey design. Three logistic models assessed: (A) perceived importance of including SSBs for oneself in social events; (B) perceived importance for "people like you" (Mexicans or Mexican Americans); and (C) WL-driven reductions in cola purchases. Covariates included sex, age, country, ethnicity, education, perceived income adequacy (ability to meet household expenses), nutritional knowledge, SSB intake in the prior week, and household food security.

Results: Model A: Income adequacy predicted perceiving SSB inclusion as important ("easy": OR=2.15; "very easy": OR=2.91; both $p<0.001$). Reporting any SSB intake increased odds (OR=1.90, $p=0.025$), and higher weekly volume was positively associated ($p<0.001$). Greater nutritional knowledge was significant (OR=2.29, $p<0.001$).

Model B: Being male (OR=1.23, $p=0.019$), residing in Mexico (OR=2.31, $p<0.001$), and higher nutritional knowledge (OR=2.15, $p<0.001$) predicted perceiving that SSBs are important for others.

Model C: WL-driven reductions in cola purchases were more likely among participants with weaker personal SN favoring SSBs (OR=0.57, $p<0.001$), Mexican residents (OR=3.34, $p<0.001$), women (OR=1.35, $p=0.003$), minorities (OR=1.72, $p<0.001$), higher nutritional knowledge (OR=1.75, $p<0.001$), and very low food security (OR=1.33, $p=0.021$). Higher weekly SSB volume reduced odds of reporting WL impact ($p<0.001$).

Conclusion: SN surrounding SSB inclusion in social gatherings influences WL responsiveness. Weaker personal norms were associated with greater WL-driven reductions in cola purchases. WLs appeared most effective among women, Mexicans, minorities, and higher nutritional knowledge, and least effective among high-volume SSB consumers. Integrating SN into public health strategies may strengthen WL impact and support SSB-reduction efforts.

SO.3.27-05

Feasibility and Acceptability of MONITOR: A Remote Monitoring Of a Nutrition Intervention To Optimize Treatment Response in Pancreatic Cancer Patients

S. Crowder¹, B. Hu¹, N. Nardella², D. Simon¹, O. Nguyen¹, Y. Rodriguez¹, J. Milano³, C. Santiago³, P. Hodul²

¹Moffitt Cancer Center, Health Outcomes and Behavior, Tampa, United States, ²Moffitt Cancer Center, Department of Gastrointestinal Oncology, Tampa, United States, ³Moffitt Cancer Center, Department of Nutrition Therapy, Tampa, United States

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Pancreatic cancer (PC) patients who maintain weight before/during treatment have statistically significantly improved survival. However, weight maintenance is challenging as more than 80% of PC patients suffer from significant weight loss coupled with severe nutrition impact symptoms (NIS) impacting the ability and desire to eat (e.g., pain, anorexia, early satiety, nausea). Despite significant weight concerns, limited interventions address nutrition coaching to enhance dietary quality and mitigate malnutrition. The aim of this pilot trial was to examine feasibility, acceptability, usability, and preliminary efficacy of a remote nutrition monitoring intervention in borderline resectable and locally advanced PC patients.

Methods: PC patients scheduled to receive neoadjuvant chemotherapy were randomized 1:1 to 1) MONITOR arm: a biweekly, remote-based personalized dietary coaching intervention focused on the dietary inflammatory index (DII) during the initial 12-weeks of chemotherapy or 2) standard usual care. *A priori* benchmarks were established for feasibility with rates of recruitment, retention, timing and acceptability with patient engagement via session attendance, adherence, and patient satisfaction with the intervention ($\geq 60\%$ recruitment; $\geq 70\%$ retention and timing; participants attendance ≥ 4 weeks of sessions (out of 6); $\geq 70\%$ report weekly SMART goal adherence; ≥ 3 for participant satisfaction). Preliminary efficacy was explored with pre- to post- intervention changes in dietary quality, body composition, and quality of life.

Results: Participants (N=35) were primarily white (97%), male (57%), married (74%), and college graduates (62%). For feasibility, 52% of eligible patients were recruited, 83% completed the post-intervention survey for the MONITOR arm, and 94% liked the timing of the intervention. For acceptability, average biweekly dietary coaching attendance was 73%, 77% adhered to weekly SMART goals, and all participants rated the intervention as ≥ 4 for participant satisfaction. There was a statistically significant decrease in the DII score, representing a more anti-inflammatory dietary pattern, (estimate=-1.31, $p=0.0025$) at 12-weeks compared to baseline for the MONITOR arm. No significant differences were noted for body composition or quality of life.

Conclusion: This intervention was feasible and acceptable. Preliminary efficacy data showed participants in the MONITOR arm significantly improved their overall diet quality. Future studies should examine intervention efficacy in a larger, randomized controlled trial.

SO.3.27-07

Establishing Reliability and Validity for the Individual Exercise Empowerment Scale

A.E. Streetman¹, E.C. Sommer¹, W.J. Heerman¹

¹Vanderbilt University Medical Center, Nashville, United States

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Exercise empowerment is the perceived confidence and control over exercise choices that lead to sustained exercise and a sense of fulfillment. It can be experienced individually and collectively, and plays a role in exercise maintenance. This study evaluated the reliability and validity of the newly developed Individual Exercise Empowerment Scale (IEES).

Methods: We followed a five-phase scale development process: 1) conceptualization, 2) expert review, 3) cognitive interviews, 4) survey administration, and 5) statistical analysis. After developing an initial item pool, experts ($n=6$)

SHORT ORALS

provided feedback on face validity. Four cognitive interviews ensured questions were interpreted as intended. In October 2025, an online survey was conducted among a convenience sample of U.S. adults using Prolific to evaluate the scale's reliability and validity. The sample was randomly halved into derivation and holdout samples for exploratory (EFA) and confirmatory factor analysis (CFA). Internal consistency reliability was measured using Cronbach's alpha; test-retest reliability was evaluated using the intraclass correlation (ICC). Spearman correlations tested convergent validity with the Exercise Self-Efficacy Scale (ESES) and the Physical Activity and Social Support Scale (PASSS), and divergent validity was tested with the Family Resiliency Spirituality Subscale (FRAS).

Results: Eight hundred ten participants completed the survey (52% female, 93% response rate). The initial item pool consisted of 31 items and was reduced to 23 due to the presence of highly correlated items. EFA revealed a theoretically meaningful four-factor solution: 1) overcoming barriers, 2) personal fulfilment, 3) external networks, and 4) exercise maintenance. CFA showed marginal structural validity (RMSEA=0.092; 95% CI=[0.086, 0.098]; CFI=0.847; TLI=0.827). Internal consistency was supported by high Cronbach's alpha coefficients for factors 1-4 (0.84, 0.81, 0.86, and 0.91), and for the full-scale (0.92). ICC was good (0.89; 95% CI=[0.87, 0.91]). Correlation analysis supported convergent validity: IEES and ESS, $r_s(808)=0.66$, $p<0.001$; IEES and PASSS, $r_s(798)=0.58$, $p<0.001$. Correlation analysis also confirmed divergent validity: IEES and FRAS, $r_s(808)=0.26$, $p<0.001$.

Conclusion: These findings suggest that the IEES is a reliable and valid tool for assessing exercise empowerment, aligning with empowerment theory. Future research may explore its predictive validity and applicability across diverse populations and settings.

SO.3.27-08

Barriers and Facilitators to Reducing Sedentary Behavior among Prostate Cancer Survivors

C. Orellana¹, H. Xiao¹, D. Khalaf¹, L. Trinh¹

¹University of Toronto, Kinesiology, Toronto, Canada

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Prostate cancer is the most common cancer in men, resulting in a growing population of survivors who often experience treatment-related side effects. Sedentary behavior (SED) is associated with adverse health outcomes, including fatigue, depression, and anxiety in prostate cancer survivors (PCS). Despite this, few interventions have directly targeted SED, and factors influencing SED reduction remain poorly understood. **The purpose of this study is to explore barriers and facilitators in reducing SED in PCS.**

Methods: Using a Grounded Theory-informed qualitative design, semi-structured interviews were conducted with 19 PCS (Mage = 72.2 ± 7.1 years; 92.6 ± 64.0 months since diagnosis). Participants were recruited through an existing study database, community organizations, and clinical referrals. Inclusion criteria required participants to be ≥18 years old, diagnosed with localized or asymptomatic metastatic prostate cancer, not receiving active radiation or chemotherapy, fluent in English, and equipped with webcam access. Interviews were conducted virtually between November 2024 and February 2025. Participants were asked to define SED, discuss perceived barriers and challenges to reducing SED, and reflect on personal and external motivators, as well as the role of social support in influencing their SED levels. Transcripts were analyzed inductively through thematic analysis.

Results: Three overarching domains emerged: (1) awareness, personal meaning, and attitudes toward SED; (2) barriers and facilitators shaping daily sitting patterns; and (3) motivation and reinforcement through social networks. Despite broad awareness of SED-related health risks, many participants struggled to integrate behavior change into their daily life. Barriers reported include fatigue, mobility limitations, chronic conditions (e.g., osteoporosis, plantar fasciitis), and concerns tied to aging or changing testosterone and prostate-specific antigen (PSA) levels. Additionally, engagement with peer-based activity groups and social accountability emerged as strong facilitators for maintaining movement and reducing sitting time.

Conclusion: Findings highlight the ongoing challenge of transforming awareness into sustainable behavioral change. Interventions targeting SED reduction in PCS should address persistent physical and motivational barriers while leveraging social connection and peer support to strengthen adherence and long-term impact.

SHORT ORALS

SO.3.27-10

Bridging Socioeconomic Gaps in Healthy Food Choices through Digital Nudges: The Moderating Role of Socioeconomic Position in Nudge Effectiveness

N. van der Waal¹, B. Deleersnyder¹, N. van der Laan¹

¹Tilburg University, Department of Communication and Cognition, Tilburg, Netherlands

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Individuals with lower socioeconomic position (SEP) face higher risks of premature mortality, obesity, and chronic diseases, partly due to poorer diets and lower adherence to nutritional guidelines. As food purchasing increasingly moves online, digital retail environments offer new opportunities to reduce these health disparities. One promising approach is the use of digital nudges: design features that subtly guide consumers toward healthier choices. Such nudges may be especially effective for lower SEP individuals by simplifying decisions and reducing cognitive demands when health literacy is limited. Although evidence generally supports positive or mixed effects of nudges in lower SEP groups, it remains unclear whether different nudge types vary in effectiveness across socioeconomic levels. Understanding these differences is essential for leveraging digital nudges to promote healthier food choices and reduce diet-related health inequalities.

Methods: This study examined the effectiveness of three nudge types and their interaction with SEP in a one-factor experiment using data from the Dutch LISS Panel (N = 1243). Participants, stratified by education, were randomly assigned to one of four conditions: a convenience nudge (behavioral), hedonic enhancement nudge (affective), evaluative labeling nudge (cognitive), or a no-nudge control. Each respondent viewed eight sweet snack products, with the three healthiest accompanied by the assigned nudge. The dependent variable was whether a healthy or unhealthy product was selected. SEP indicators (income, subjective income, subjective social status) served as moderators.

Results: Contrary to expectations, nudges did not increase the likelihood of choosing healthy products: only 33% of selections were healthy, below the 37.5% random-choice benchmark. A potential backfire effect emerged for the hedonic enhancement nudge, which increased unhealthy selections. Moderation analyses revealed significant interactions between education and nudge type. Convenience and evaluative labeling nudges promoted healthier choices among participants with lower education, whereas effects reversed for higher educated individuals.

Conclusion: These findings suggest that digital nudges are not equally effective across SEP groups. In particular, convenience and evaluative nudges may better support healthier food choices among lower-educated individuals than among higher-educated ones, underscoring the need for a more nuanced understanding of how socioeconomic indicators shape the cognitive and emotional processes underlying digital food choice behavior.

SO.3.27-11

Losing the Active Way: Two Decades of Change in Czech Adolescents' School Travel Patterns

M. Vorlíček¹, D. Sigmundová¹, P. Baďura¹, J. Dygrýn¹, M. Kalman¹, E. Sigmund¹

¹Palacký University Olomouc, Olomouc, Czech Republic

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Active school transport (AST) is a key contributor to adolescents' daily physical activity and a potential lever for reducing obesity and promoting sustainable mobility. However, many high-income countries have reported declining AST participation over the past two decades. This study aimed to analyze long-term trends (2006–2022) in AST among Czech adolescents and to identify sociodemographic factors influencing participation, focusing on school travel distance, family affluence, age, and gender. This analysis provides the first nationally representative insight into whether previous declines in AST have stabilized or continued, offering important implications for public health and transport policy.

SHORT ORALS

Methods: Data were obtained from five nationally representative waves (2006, 2010, 2014, 2018, 2022) of the Czech Health Behaviour in School-aged Children (HBSC) study. The sample included **50,713 adolescents** aged 11, 13, and 15 years (50.1% boys). AST was assessed using self-reports of the main mode of travel to and from school, categorized as active (walking or cycling) versus passive. Independent variables included survey year, gender, age, Family Affluence Scale (FAS), and travel time to school. Weighted logistic regression analyses were conducted to estimate odds ratios (ORs) for AST participation while adjusting for all covariates.

Results: The prevalence of AST to school decreased from **71.7% in 2006** to **54.9% in 2022**, with a similar decline for travel from school (74.2% → 62.0%). The largest drop occurred between 2006 and 2010, after which rates stabilized. Boys consistently reported slightly higher AST than girls ($OR = 0.91-0.93, p < 0.001$). Adolescents from high-affluence families were significantly less likely to use AST than their low-affluence peers ($OR = 0.41-0.50, p < 0.001$). Travel time was the strongest determinant—students commuting more than 30 minutes had over **90% lower odds** of using AST ($OR = 0.07-0.09, p < 0.001$).

Conclusion: Between 2006 and 2022, active commuting to school among Czech adolescents declined markedly and has not recovered in recent years. Longer commuting distances and higher family affluence strongly predicted lower AST participation. These findings highlight the urgent need for **context-sensitive interventions**, including safe, walkable, and cycling-friendly urban environments, and school-based initiatives promoting sustainable and health-enhancing mobility.

SO.3.27-13

Does Civic Engagement Added to a Community Walking Program Confer More Benefit? A Comparative Effectiveness Trial in Rural Oregon

C.K. Perry¹, J. Currier², N. Lenstra³, J. Maddock⁴, N. Dieckmann¹, J. Winkle¹, H. Franklin¹, S. Trost⁵, E. Andreyeva⁴, R.A. Seguin-Fowler⁶

¹Oregon Health & Science University, School of Nursing, Portland, United States, ²Oregon Health & Science University, Knight Cancer Institute, Portland, United States, ³University of North Carolina, School of Education, Greensboro, United States, ⁴Texas A & M University, School of Public Health, College Station, United States, ⁵The University of Queensland, School of Human Movement and Nutrition Sciences, Brisbane, Australia, ⁶Texas A & M University, Institute for Advancing Health through Agriculture, College Station, United States

SO.3.27 Motivation and behavior change: Determinants of Physical Activity, Sedentary Behavior, and Healthy Lifestyle Behaviors in Young Adults

Room 2, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: There is a major gap in achieving reach and sustainable impact in physical activity to reduce rural residents' risk of physical inactivity-related diseases. Promoting physical activity with multilevel programs is considered more effective than single-level programs. We conducted a comparative effectiveness trial of two multilevel programs, Step It Up! (SIU), a group walking program and SIU plus Change Club (CC), a civic engagement program aimed at enhancing walkability via community resident involvement, on the outcomes of physical activity, fitness, and collective efficacy.

Methods: Eighteen rural Oregon libraries were randomized to implement either SIU (60 minutes) or SIU plus CC (90 minutes) weekly for two years (Spring 2023-2025). Data were collected at baseline, 6, 12 and 24 months. Accelerometers worn by participants for a week measured physical activity (categorized into total physical activity and moderate-vigorous physical activity) and the 6-minute walk test measured fitness. Participants completed surveys on demographic, health and psychosocial variables (e.g., collective efficacy); attendance was recorded. Primary outcome analyses will be conducted with a linear mixed-effects modeling approach implemented in the lmer package in R. This model will account for nesting within- (i.e., longitudinal assessments) and between-person (i.e., intervention group, and site) with fixed effects for time, group, and the group x time interaction. We will evaluate primary hypothesis tests at traditional significance levels ($\alpha = .05$) and use modern methods to control for false discovery rate for post hoc analyses. Model diagnostics will be used to confirm statistical assumptions have been met. In the case of violations, more robust alternative models will be employed (e.g., robust mixed-effects models) as appropriate.

Results: Libraries enrolled 330 participants (SIU=164, SIU+CC=166; 86% female, 92% white, 60% aged 65 or older) and 260 were actively engaged at 2 years (SIU=135, SIU+CC=124; 79% retention rate). Final outcomes analyses will be conducted in December 2025 and final results will be presented at the ISBNPA meeting.

Conclusion: Rural libraries were able to successfully implement the programs for two years with good retention. Final results will provide the relative effectiveness of a walking program with or without civic engagement among rural residents, which can inform future dissemination efforts.

SHORT ORALS

SO.3.28-01

Physical Activity Levels of Early Childhood Educators: A Systematic Review and Meta-analysis

M. Hawthorne¹, B. Inniss¹, R. Heydon², S. Burke³, P. Tucker¹

¹Western University, School of Occupational Therapy, London, Canada, ²Western University, Faculty of Education, London, Canada, ³Western University, Faculty of Health Sciences, London, Canada

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: While early childhood educators (ECEs) are instrumental in promoting healthy active lifestyles among young children, little is known about their physical activity (PA) levels. Understanding ECEs' PA behaviors is essential, as their personal activity patterns may influence how they model and encourage movement within childcare settings. The purpose of this systematic review and meta-analysis was to synthesize current evidence on ECEs' PA levels. The three primary aims were to examine: (1) the amount of time ECEs spend in moderate-to-vigorous physical activity (MVPA) each week; (2) the proportion of ECEs who meet the World Health Organization's (WHO) 24-Hour Movement Guidelines for adults; and (3) the associations between ECEs' and children's PA levels.

Methods: Searches were conducted across seven databases using terms related to PA, education, and early childhood. Studies were eligible if they reported quantitative data on at least one of the three objectives. Pooled estimates for MVPA and guideline adherence were generated using meta-analyses, and relationships between ECEs' and children's PA were synthesized narratively. Of the 21 studies included ($n = 5,291$ participants), 18 reported on MVPA (11 included in the meta-analysis), 11 reported WHO guideline adherence (11 included in the meta-analysis), and 6 examined ECE and child PA associations.

Results: ECEs accumulated an average of 223.6 minutes of MVPA per week (95% CI: 83.6–363.5), although there was substantial heterogeneity between studies ($I^2 = 97.6\%$). Just over half of participants (52.6%; 95% CI: 35.9%–68.8%; $I^2 = 97.3\%$) met the WHO 24-Hour Movement Guidelines, with proportions ranging from 21% to over 90%. Modest, but generally positive, associations were observed between educators' and children's PA, suggesting that more active educators may help foster greater movement among children in their care.

Conclusion: Overall, many ECEs were found to have achieved recommended levels of PA, underscoring their potential as active role models within childcare environments. Strengthening initiatives that support ECEs' movement behaviors may positively influence not only their own health and well-being, but also children's PA patterns. Future work should prioritize consistent measurement approaches, transparent data reporting, and intervention studies that leverage ECEs' unique position to promote movement-rich childcare settings.

SO.3.28-02

Associations between Cardiorespiratory Fitness and Muscular Strength with Arterial Stiffness in Children and Adolescents: A Systematic Review and Meta-analysis

M. Atencia-Rodriguez¹, D. Rodriguez-Sanchez¹, V. Martinez-Vizcaino², M. Herrada-Robles¹, I. Labayen^{3,4}, G.R. Tomkinson⁵, L. Gracia-Marco^{1,4}, C. Cadenas-Sanchez^{1,4}

¹University of Granada, Department of Physical Education and Sports, Granada, Spain, ²University of Castilla-La Mancha, Health and Social Research Center, Cuenca, Spain, ³Public University of Navarre, Institute for Sustainability and Food Chain Innovation (IS-FOOD), Pamplona, Spain, ⁴CIBER de Fisiopatología de la Obesidad y Nutrición (CIBEROBN), Instituto de Salud Carlos III, Madrid, Spain, ⁵University of South Australia, Alliance for Research in Exercise, Nutrition and Activity (ARENA), Adelaide, Australia

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: To synthesize and meta-analyse associations between cardiorespiratory fitness and muscular strength with arterial stiffness in children and adolescents aged 6–18 years.

Methods: A systematic review with meta-analysis was conducted following PRISMA guidelines¹ and prospectively registered in PROSPERO (CRD420251020370). MEDLINE, Web of Science, and Scopus were searched from inception to

SHORT ORALS

February 2025. Eligible studies included cross-sectional, longitudinal, and intervention designs reporting correlations between physical fitness (cardiorespiratory fitness or muscular strength) and arterial stiffness (assessed via pulse wave velocity [PWV] and augmentation index [AIx]) in participants aged 6–18 years. Search results were imported into Rayyan to remove duplicates and screen studies in two stages (titles/abstracts and full texts) by two independent reviewers, with discrepancies resolved by consensus or a third reviewer. Data on participant characteristics, fitness and arterial stiffness measures, and correlational estimates were extracted. Study quality was assessed using Joanna Briggs Institute checklists. Random-effects meta-analyses estimated pooled correlation coefficients (r), with heterogeneity assessed as I^2 . Publication bias was evaluated visually by funnel plots and formally by Egger's and trim-and-fill tests. Subgroup analyses considered age, sex, and arterial stiffness outcomes.

Results: Twenty-four studies ($n=12,711$) were included, with 19 unique studies ([CC1] $n=2,615$) contributing to meta-analyses. Cardiorespiratory fitness showed a small, non-significant negative correlation with arterial stiffness in cross-sectional analyses (pooled $r = -0.11$; 95% CI: $-0.22, 0.01$; $n = 2,615$; $I^2 = 85.6\%$) and a near-null association in longitudinal studies (pooled $r = 0.04$; 95% CI: $-0.02, 0.10$; $n = 971$; $I^2 = 0\%$). Muscular strength was assessed in only three studies, yielding a small non-significant negative correlation (pooled $r = -0.11$; 95% CI: $-0.25, 0.03$; $n = 778$; $I^2 = 52.6\%$). Subgroup analyses did not reveal significant differences by age, sex, or outcome type. No meaningful publication bias was detected.

Conclusion: Cardiorespiratory fitness and muscular strength were not significantly associated with arterial stiffness (PWV or AIx) in children and adolescents. Evidence remains limited, heterogeneous, and primarily cross-sectional. Well-designed longitudinal and intervention studies using standardized arterial stiffness and fitness test protocols are needed to clarify whether physical fitness influences early vascular health in youth.

SO.3.28-03

Preschool Teacher Education and Child-teacher Ratio in Relation to Children's Health: A Large-scale Study of Preschoolers in Stockholm, Sweden

C. Wilén^{1,2}, P. Campos-Garzón^{1,3}, J. Hidalgo Migueles^{1,3}, P. Henriksson⁴, P. Tynelius^{1,5}, C. Chen^{1,5}, D. Berglind^{1,2,5}, V. H. Ahlqvist^{6,7}

¹Karolinska Institutet, Department of Global Public Health, Stockholm, Sweden, ²Stockholm School of Economics, Center for Wellbeing, Welfare and Happiness, Stockholm, Sweden, ³University of Granada, Department of Physical Education and Sports, Granada, Spain, ⁴Linköping University, Department of Health, Medicine and Caring Sciences, Linköping, Sweden, ⁵Region Stockholm, Centre for Epidemiology and Community Medicine, Stockholm, Sweden, ⁶Aarhus University, Department of Biomedicine, Aarhus, Denmark, ⁷Karolinska Institutet, Institute of Environmental Medicine, Stockholm, Sweden

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: While many studies have examined how the physical environment influences preschool children's physical activity, less attention has been given to staff qualifications and child-teacher ratios. This study used population-based data from Stockholm preschools to examine how these factors relate to children's physical activity, inactivity, body mass index (BMI), and psychosocial functioning, to help inform future early childhood education policies.

Methods: This cross-sectional study combined data from two measurement occasions (spring 2020 and autumn 2021). Information on teacher education and child-teacher ratios was obtained from the Swedish National Agency for Education. Children's moderate-to-vigorous physical activity (MVPA) and inactivity were measured using accelerometers worn for one week. Psychosocial functioning was assessed using the Strengths and Difficulties Questionnaire (SDQ), and BMI was derived from measured height and weight. Mixed-effects linear and logistic regression models accounted for clustering within schools and adjusted for child age, sex, measurement occasion, and neighbourhood socioeconomic index. Models including teacher education additionally adjusted for child-teacher ratio, and vice versa.

Results: Analyses included 3,302 children for physical activity, 2,666 for SDQ, and 3,518 for BMI across 124 preschools representing all districts in Stockholm. On average, 31.8% of full-time teachers held a teaching degree, and the mean child-teacher ratio was 5.1 (SD 0.7). No strong associations were observed between teacher education levels or child-teacher ratios and children's MVPA, inactivity, SDQ, or BMI. Compared with the median, the 75th percentile of teacher education was associated with -0.22 minutes (95% CI: -0.84 to 0.40) and the 25th percentile with -0.04 minutes (95% CI: -0.77 to 0.69) daily MVPA. Similarly, increasing the child-teacher ratio from 5.0 to 5.5 children per teacher corresponded to -0.45 minutes (95% CI: -1.17 to 0.28) daily MVPA, with negligible differences in SDQ and BMI z-scores.

SHORT ORALS

Conclusion: In this large, population-based study of Stockholm preschoolers, no evidence was found that teacher qualification levels or child-teacher ratios were associated with children's physical activity, psychosocial functioning, or BMI. These findings suggest that factors beyond staffing characteristics may be more influential in shaping children's health and well-being in preschool settings.

SO.3.28-04

Accelerometer Measured Physical Activity in UK Early Childhood Education and Care Settings: A Cross-sectional Study

R. Maishman¹, A. Dobell², M. Pallan², P. Blair¹, J. White³, S.A. Simpson⁴, A. Martin⁴, R. Kipping¹, R. Jago¹, K. Hannam¹

¹University of Bristol, Bristol, United Kingdom, ²University of Birmingham, Birmingham, United Kingdom, ³University of Cardiff, Cardiff, United Kingdom, ⁴University of Glasgow, Glasgow, United Kingdom

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Low levels of physical activity (PA) in early childhood can impact on children's healthy development and increase the risk of a range of chronic conditions in later life. Accelerometer measured physical activity data within and outside of early childhood education and care (ECEC), together with demographic data, are needed to support policy changes and intervention development for the United Kingdom (UK).

Methods: Accelerometer data for 419 children aged 2-4 years (49.6% male) attending UK ECEC settings were analysed. Mixed-effects linear regression models were fitted to compare levels of PA between weekdays attending an ECEC, weekdays not attending an ECEC and weekend days. The proportion of children meeting international guidelines for physical activity and probability of children meeting these guidelines were analysed.

Results: TPA was significantly higher on ECEC weekdays than non-ECEC weekdays (mean difference (MD) -14.6 minutes (95% CI -20.8, -8.4), $p < 0.001$) and weekends (MD -11.5(-19.5, -3.5), $p = 0.005$). Girls had lower TPA on ECEC weekdays (adjusted MD -14.02 (-22.35, -7.48), $p < 0.001$) and activity for all children increased with months of age (adjusted MD 1.61 (1.11, 2.11), $p < 0.001$). Findings were similar for non-ECEC weekdays. Less than a quarter of children (23%) met the guideline of 180 minutes of total physical activity per day and 2.4% of children met the guidelines for 60 minutes of daily MVPA. Fewer girls achieved the recommended TPA (OR 0.53 (0.29, 0.97), $p = 0.038$) and guidelines were more likely to be met in older children (OR 1.12 (1.06, 1.17), $p < 0.001$).

Conclusion: Early years children were more active on days attending ECEC settings are were largely not meeting the recommended activity levels within ECEC or home environments. ECEC settings provide a unique environment that have potential to promote and encourage higher levels of PA and reduce inequalities in PA. The low proportion of children within our UK population sample who met the physical activity guidelines emphasises the importance of ongoing focus, investment and research in this area to improve PA in the early years, which will impact on health and wellbeing throughout the life course.

SO.3.28-05

1-2-3 MOVE!: A COM-B-Guided Co-creation Approach to Enhance Toddlers Motor Competence with ECEC Staff and Preventive Family Support Professionals

E. Coppens¹, L. Geirnaert¹, L. Daelman^{2,1}

¹Ghent University, Movement and Sports Sciences, Gent, Belgium, ²Vrije Universiteit Brussel, Movement and Sport Sciences, Brussel, Belgium

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: A recent study revealed a significant leftward shift in motor competence (MC) among Flemish toddlers, with only 3.8% performing above average or superior compared to 25.3% in the PDMS-2 reference values. As over 70% of Flemish toddlers attend Early Childhood Education and Care (ECEC) centers, these settings are crucial to support motor development. This study takes an innovative, co-creative approach by actively involving ECEC staff

SHORT ORALS

and preventive family support professionals in developing feasible and context-specific strategies to enhance MC. The first step involved administering a COM-B questionnaire (i.e., Capability, Opportunity, Motivation, Behaviour) to systematically identify factors affecting support for MC. Insights from this step will guide the design of contextually relevant strategies.

Methods: A newly developed questionnaire, grounded in the COM-B model (Michie et al., 2011) and the Theoretical Domains Framework (De Leo et al., 2021), was used to assess barriers and facilitators among ECEC staff (N=112) and preventive family support professionals (N=58). This approach systematically identifies behavioural determinants in early childhood settings.

Results: Capability, assessed through 15 expert-validated statements on essential MC knowledge, showed a mean score of 10.08/15, suggesting gaps in basic understanding of gross and fine motor skills as well as in developmental milestones. Social opportunities within organizations and from colleagues were generally satisfactory, though support from government and local agencies was perceived limited. Parents were often perceived as a key barrier, hindering efforts to support toddlers' MC. Physical opportunities, such as workspace, were adequate, yet participants felt insufficiently supported in acquiring and applying knowledge to promote MC. Motivation was relatively high, reflecting strong willingness to support MC. However, ECEC staff reported greater confidence in supporting gross motor skills than fine motor skills, and lowest confidence in supporting infant motor development. These differences were not observed among preventive family support professionals.

Conclusion: Findings highlight professional learning needs in supporting toddlers' MC and underscore the importance of engaging parents, ideally with support from local or governmental agencies. COM-B insights provide a foundation for the next co-creation phases to develop sustainable, context-specific strategies that strengthen capability, opportunity and motivation to foster rich movement opportunities in early childhood.

SO.3.28-06

Early Childhood Lifestyle Patterns and Risk of Overweight at 5 Years

M. Baietto¹, C. Le Gal¹, A. Descarpentrie², M. Lecorguillé¹, J.Y. Bernard³, J. Pilato⁴, J. van der Waerde⁴, B. de Lauzon-Guillain¹, M.-A. Charles^{1,5}, B. Heude¹, S. Lioret¹

¹Université Paris Cité and Université Sorbonne Paris Nord, Inserm, INRAE, Centre for Research in Epidemiology and Statistics (CRESS), Paris, France, ²Department of Pediatrics, The Saban Research Institute, Children's Hospital Los Angeles, University of Southern California, Los Angeles, United States, ³Université de Montpellier, Inserm, Desbrest Institute of Epidemiology and Public Health, Montpellier, France, ⁴Social Epidemiology Mental Health and Addictions (ESSMA), Institut Pierre Louis d'Epidémiologie et de Santé Publique (IPLESP), Sorbonne Université, INSERM, Paris, France, ⁵Ined, Inserm, EFS, Joint Unit Elfe, Aubervilliers, France

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: An unhealthy diet, excessive screen time, low levels of physical activity and suboptimal sleep are known risk factors for childhood overweight. These behaviors tend to co-occur and combine into "lifestyle patterns" (LPs) that may exert synergistic effect on health. However, few studies have examined such LPs before preschool age, and none have incorporated parental feeding practices (breastfeeding and age at complementary feeding), leisure activities beyond screen time and sleep quality. We aimed to identify such LPs during the first two years of life and assess their associations with overweight at 5 years and age at adiposity rebound (AR).

Methods: Participants were children from the ELFE study, a French nationwide birth cohort launched in 2011. Postnatal factors were assessed through parental questionnaires, and anthropometric data were extracted from child health booklets. LPs were derived using principal component analysis of 18 items (n=13,121). Associations with overweight at 5 years (IOTF definition; n=8,388) and with age at AR (in days; n=7,845) were assessed using multivariable logistic and linear regression models, respectively.

Results: Three LPs were identified, explaining 32% of the total variance. The first was characterized by early introduction of complementary feeding and sweet beverages, and at 2 years, by high consumption of energy-dense and nutrient-poor foods, alongside high screen time. The second LP reflected high intake of fruits, vegetables, fish and dairy products (yogurts and *petits suisses*), along with frequent engagement in non-screen leisure activities. The third LP represented a mixed pattern, with longer breastfeeding duration, complementary feeding after 4 months, and, at 2 years, low dairy intake combined with short and poor-quality sleep. Higher scores on the first pattern were associated with increased risk of overweight at 5 years (OR [95% IC] = 1.09 [1.03; 1.16]) and an earlier age at AR (β = -10.79 [-17.88; -3.70]). No significant associations were observed for the other two patterns.

Conclusion: These results emphasize the critical role of the perinatal period in the development of early and

SHORT ORALS

interrelated lifestyle behaviors associated with overweight risk. They call for interventional studies to evaluate the effectiveness of integrated, early-life multibehavioral strategies to prevent childhood overweight.

SO.3.28-07

Individual- and Center-level Predictors of Early Childhood Educators' Active Play Practices

L.C. Masse¹, O. De-Jongh Gonzalez¹, E.J. Buckler², C. Wright²

¹University of British Columbia, School of Population and Public Health, Vancouver, Canada, ²University of Victoria, Exercise Science, Physical and Health Education, Victoria, Canada

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Background: Early childhood educators (ECEs) play a pivotal role in fostering young children's active play (AP) and fundamental movement skills (FMS). However, a range of individual and organizational factors may shape educators' capacity to provide developmentally rich AP opportunities. Understanding the relative influence of these factors is essential to inform strategies that promote daily AP in childcare settings.

Objective: To examine how individual-level factors (training, self-efficacy, and awareness of provincial standards and initiatives) and center-level characteristics (presence of schedules that include FMS and frequency of changing play installations) relate to educators' reported AP- and FMS-promoting practices.

Methods: A cross-sectional survey was completed by 207 ECEs (mean age=41 years; 96% female) from 59 licensed childcare centers across British Columbia. Participants reported on their training, self-efficacy, awareness of AP standards and initiatives, presence of FMS schedules, and frequency of environmental changes at the facility. Educators also self-reported their AP-related practices from the previous day, including modeling of AP, minutes spent outdoors, number of outdoor sessions, minutes of AP with children, and number of FMS facilitated. Covariate-adjusted logistic mixed-effects models were used to examine associations between individual- and center-level predictors and educators' practices, accounting for clustering by center.

Results: High self-efficacy and awareness of AP standards were significant predictors of modeling AP outdoors (OR=4.56 and OR=3.48, respectively). High self-efficacy also predicted facilitating a greater number of FMS activities (OR=4.82). Other daily practice outcomes were not significantly associated with individual factors, and no center-level characteristics were significantly related to educators' reported practices.

Conclusion: Findings suggest that educators' confidence and familiarity with AP standards may be key drivers of AP promotion in childcare settings. Strengthening ECEs' self-efficacy and awareness through targeted professional development could enhance the consistent implementation of AP and FMS opportunities, independent of structural center-level factors.

SO.3.28-08

Rain or Shine: Weather Conditions Shape Movement Behaviors in Preschoolers Using Compositional Data Analysis

P. Garzón¹, P. Tynelius^{1,2}, M. Lundberg¹, C. Wilén^{1,3}, V.H. Ahlqvist^{4,5}, J.H. Migueles⁶, M. Nevius⁷, P. Henriksson⁸, M. Dahlén³, C. Magnusson^{1,9}, D. Berglind^{1,3,9}

¹Karolinska Institutet, Global Public Health, Stockholm, Sweden, ²Stockholm County Council, Centre for Epidemiology and Community Medicine, Stockholm, Sweden, ³Stockholm School of Economics, Center for Wellbeing, Welfare and Happiness, Stockholm, Sweden, ⁴Karolinska Institutet, Biomedicine, Stockholm, Sweden, ⁵Karolinska Institutet, Institute of Environmental Medicine, Stockholm, Sweden, ⁶University of Granada, Granada, Spain, ⁷Karolinska Institutet, Medicine, Stockholm, Sweden, ⁸University of Linköping, Health, Medicine and Caring Sciences, Linköping, Sweden, ⁹Region Stockholm, Centre for Epidemiology and Community Medicine, Stockholm, Sweden

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

SHORT ORALS

Purpose: To investigate the associations between daily weather conditions and movement behaviors (moderate-to-vigorous physical activity [MVPA], light physical activity [LPA], and sedentary behavior [SB]) in Swedish preschoolers, and to examine whether these associations differed by gender and day type (weekdays vs. weekends).

Methods: A total of 3307 preschoolers (4.5 ± 0.9 years; 51.4% girls) wore accelerometers to measure daily time spent in MVPA, LPA, and SB during seven days. Weather variables (temperature, sunshine, daylight duration, precipitation, and snow) were obtained from the National Meteorological Agency. A principal component analysis followed by k-means clustering was used to classify each day into different categories. Compositional data analysis (CoDA) was applied using isometric log-ratio (ILR) transformation and linear mixed-effects models, with predictions back-transformed to minutes/day using bootstrap procedures (1,000 replicates).

Results: Four weather-based clusters were identified: sunny and warm, cold and cloudy, rainy, and cloudy days. The mixed-effects model showed a significant association between weather clusters and daily movement composition ($p=0.001$). Compared with sunny and warm days, cold and cloudy days were associated with -14.6 min MVPA, -32.1 min LPA, and $+46.7$ min SB. Rainy days showed -10.9 min MVPA, -7.8 min LPA, and $+18.7$ min SB, while cloudy days showed -8.2 min MVPA, -6.8 min LPA, and $+15.0$ min SB. Gender-interaction showed similar responses in boys and girls ($p>0.05$). In contrast, the day-type interaction showed stronger weather effects on weekends ($p<0.001$). On cold and cloudy weekends, preschoolers engaged in less MVPA (-17 min) and LPA (-81 min), and more SB ($+98$ min) than on sunny and warm weekends. Rainy weekends also reduced PA (-11 min MVPA, -22 min LPA) and increased SB ($+33$ min), while cloudy weekends showed smaller changes (-9 min MVPA, -6 min LPA, $+15$ min SB). On weekdays, the same patterns appeared but were less pronounced.

Conclusion: Weather conditions exert a strong influence on preschoolers' movement behaviors. Cold, cloudy, and rainy days consistently reduced physical activity and increased sedentary time, with the most pronounced effects occurring on weekends. These findings highlight the importance of considering environmental context when designing interventions to support active lifestyles in preschoolers.

SO.3.28-09

Instructors' Perspectives on Implementing an E-learning Course on Physical Activity and Sedentary Behaviours in Canadian Early Childhood Education Programs

T. Tucker¹, S. Kim¹, M. Gorman¹, M. Bourke², S. Phillips¹, B. Bruijns¹, L. Vanderloo³, S. Burke¹, R. Heydon¹, J. Irwin¹, K. Adamo⁴, V. Carson⁵

¹Western University, London, Canada, ²University of Queensland, Brisbane, Australia, ³ParticipACTION, Toronto, Canada, ⁴University of Ottawa, Ottawa, Canada, ⁵University of Alberta, Edmonton, Canada

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The TEACH e-Learning course, focused on movement behaviours in the early years, was found to be acceptable, effective, and feasible, with moderate-to-high fidelity in pre- and in-service early childhood educators. Moreover, it facilitated increases in educators' knowledge, self-efficacy, and intentions to promote physical activity in childcare. However, course implementation and feasibility have not been explored with instructors in pre-service early childhood education (ECE) programs. Thus, the aim of this study was to evaluate and gather ECE instructors' perspectives on the implementation of the TEACH e-Learning course in pre-service ECE curricula in Canada.

Methods: English-speaking institutions in Canada with entry-to-practice ECE programs were invited to participate. Program instructors were asked to review the TEACH e-Learning course and complete a process evaluation survey via Qualtrics. The survey examined: current ECE curriculum content at participating instructors' institutions (6 items), perspectives of topics covered in ECE curriculum (19 items), as well as the content, design, educational quality, and curriculum alignment of the TEACH e-Learning course (18 items). Zoom interviews ($n = 9$) were conducted to gather instructors' perspectives. Descriptive statistics were calculated for process evaluation survey data, and thematic analysis was employed to analyze interview transcripts.

Results: There was strong alignment ($M=4.58$) between the TEACH course and current ECE curriculum, with positive ratings for content, design, and educational quality. Instructors felt the TEACH course objectives complemented their program's curriculum ($M=4.83$), and met licensing standards ($M=4.42$). Instructors strongly endorsed its relevance for pre-service educators ($M=4.92$) and supported its continued use and integration. Instructors considered the course to be informative, well-structured, and engaging, with high effectiveness in covering physical activity ($M=5.00$). Five main themes emerged from the interviews: 1) course content (e.g., bridging knowledge gaps, reinforcing existing

SHORT ORALS

curriculum); 2) course design (e.g., interactive features support student engagement); 3) implementation feasibility (e.g., acceptability of e-Learning platform); 4) student uptake (e.g., workload considerations); and, 5) application of the course in practice (e.g., leveraging practical tools to sustain long-term impact, encouraging educators to advocate for broader system and policy changes).

Conclusion: Findings provide support for the integration of the TEACH e-Learning course in ECE curricula across Canada, including strategies for successful implementation.

SO.3.28-10

Examining Predictors of Outdoor Time and Patterns of Indoor and Outdoor Physical Activity among Preschool Children

C. Neshteruk¹, E. Willis², K. Chen¹, D. Hales²

¹Duke University School of Medicine, Population Health Sciences, Durham, United States, ²University of North Carolina at Chapel Hill, Chapel Hill, United States

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The purpose of this study was to 1) identify child-level predictors of outdoor time while in childcare and 2) examine differences in children's outdoor and indoor physical activity.

Methods: Data were from 721 children ages 3-5 years who participated in a childcare-based healthy eating and physical activity cluster randomized controlled trial. Children wore an ActiGraph GT3X+ accelerometer on their hip for seven consecutive days with the ambient light sensor enabled. Outdoor time was classified using minute-level lux values (i.e., measure of light exposure). A cut point of 37 lux was used to distinguish between indoor and outdoor time. Physical activity data were collected in 15-second epochs and processed to assess non-wear time and compute physical activity outcomes using age-appropriate hip cut points. Additional variables included child sex, age, and body mass index (BMI). Mixed effect models were constructed to examine 1) predictors of outdoor time adjusted for wear time and 2) differences in outdoor and indoor moderate to vigorous physical activity (MVPA) by child age and sex.

Results: Mean outside time per day was 71.4 (± 55.0) minutes. Child sex, age, and level of MVPA were significantly associated with daily outside time such that girls ($p > 0.001$), increasing age ($p = 0.04$) and increasing daily minutes of MVPA ($p < 0.001$) were associated with higher daily outdoor time. Child BMI did not predictor outdoor time ($p = 0.44$). When comparing indoor and outdoor MVPA, children had significantly higher percent time in MVPA outdoors compared to indoors (18.2% vs. 7.7%; $p < 0.001$). Compared to girls, boys had higher percent time in MVPA indoors (8.1% vs 7.3%, $p < 0.001$) and outdoors (20.0% vs. 17.0%; $p < 0.001$). For age, percent of outdoor time in MVPA increased with age (3-3.5 years: 17.2%, 3.5-.4.5 years: 18.4%, 4.5+ years: 19.0%; $p < 0.001$).

Conclusion: Findings show higher percent time in MVPA when outdoors among preschool children in childcare, with differences by age and sex. This highlights the importance of providing opportunities for outdoor time in childcare settings to promote young children's physical activity.

SO.3.28-11

Differences and Determinants of Physical Education Enjoyment in Children with and without Special Educational Needs

J.D. Guldager¹, L.M. Emtoft², A.L. Bentholm³

¹University College South Denmark, Research, Esbjerg, Denmark, ²University College Absalon, Vordingborg, Denmark,

³University College North, Hjørring, Denmark

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Enjoyment of physical education (PE) is a key determinant of children's motivation to be physically active. However, little is known about how students with special educational needs (SEN) experience enjoyment in inclusive PE settings. This study aimed to (1) compare PE enjoyment between students with and without SEN, and (2) identify

SHORT ORALS

individual and contextual factors associated with enjoyment among students with SEN. The study provides novel quantitative evidence on an underrepresented group, contributing to the development of inclusive and motivating PE practices.

Methods: A cross-sectional survey was conducted in six Danish schools across three regions. In-class questionnaires assessed PE enjoyment, demographic characteristics, and leisure-time sport participation. Group differences were examined using Pearson's chi-square and Mann-Whitney U tests, and predictors of enjoyment were analyzed through multivariate linear regression. Analyses were part of the larger *"Moving PE – for children with special needs in school and leisure time"* project, which focuses on providing students with SEN positive experiences in PE through the integration of co-teaching.

Results: A total of 428 students (aged 6–15 years) completed the questionnaire, including 89 with SEN. The overall mean enjoyment score was 19.95 (range 4–24). Students with SEN reported significantly lower enjoyment (mean = 18.73) compared with those without SEN (mean = 20.29; $p = .029$). Among students with SEN, boys, those attending schools in Eastern Denmark, and those participating in leisure-time sports reported higher enjoyment, whereas students from larger schools reported lower enjoyment. No significant differences were found by age.

Conclusion: Although most students with SEN enjoy PE, their overall enjoyment remains lower than that of peers without SEN. The findings identify both individual (gender, leisure-time activity) and contextual (school size, region) factors linked to PE enjoyment. This study advances understanding of how inclusive and supportive PE environments can enhance engagement and motivation among students with SEN, offering evidence to inform school-based physical activity promotion and teacher training initiatives.

SO.3.28-12

Co-teaching in Physical Education to Support Inclusion of Pupils with Special Educational Needs

A. Bentholm¹, L. Mørk Emtoft², J. Dalgaard Guldager³

¹University College North, UCN, Hjørring, Denmark, ²University College Absalon, Vordingborg, Denmark, ³University College South, Esbjerg, Denmark

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: In Danish public schools, 23.4% of all pupils have special educational needs (SEN), often with autism or ADHD. Physical Education (PE) teachers often feel unqualified to teach this group, and 41% of pupils with SEN are exempt from subjects in school, most frequently from PE. This highlights a need for professional development and new didactic approaches to support inclusive PE that promotes participation among pupils with SEN. Over the past few years, merging special education with general pedagogy, has become more common in Danish schools. While existing research on co-teaching and inclusion shows positive outcomes, it mainly focuses on academic subjects, leaving a gap in knowledge about co-teaching in PE. This study aims to present the experiences of 12 PE teams using co-teaching throughout a school year, identifying both enabling and limiting factors.

Methods: The study is based on 6–8 co-teaching observations per PE team (84 in total), and 12 focus group interviews. Analysis follows Dubois and Gadde's abductive case study approach, using Sallis et al.'s socio-ecological model (policy, organizational, interpersonal, and individual levels) to identify opportunities and barriers.

The analysis is part of the broader research study *"Moving PE – for children with special needs in school and leisure time"* which explores inclusion in PE through co-teaching.

Results: The analysis identified three archetypes, each exemplified through a distinct PE team case: *the high jumper*, *the middle-distance runner*, and *the hurdler*. The high jumper used co-teaching consistently and reported mostly positive experiences across all four socio-ecological levels. The hurdler used co-teaching minimally due to significant barriers, especially at the organizational and interpersonal levels. The middle-distance runner showed varied use of co-teaching, with interpersonal relationships being key to its implementation.

Conclusion: Co-teaching was implemented to varying degrees in PE. Support from school leadership, such as creating organizational structures and stable PE teams, was crucial. When co-teaching was used systematically, it contributed to greater participation and inclusion of pupils with SEN in PE. This study contributes pedagogical suggestions to support more inclusive teaching practices in PE.

“They Don’t Notice That I’m Leaving” - How Children with Special Educational Needs Experience Participation in Physical Education

L. Emtoft¹, A.L. Bentholt², J. Dalgaard Guldager³

¹Absalon, School and Learning, Vordingborg, Denmark, ²University College North, Pædagogik, Ålborg, Denmark,

³University College South, Health, Esbjerg, Denmark

SO.3.28 Early care and education: Physical Activity in Educational Contexts: Early Childhood and Inclusive Practices
Room 3, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Physical education (PE) can pose unique challenges for children with special needs (SEN) due to bodily, social, and cognitive differences that may affect how they engage and interact with others. These children are often excluded from PE and tend to have lower levels of physical activity, which can negatively influence both their physical health and emotional wellbeing. The purpose of this study is to explore how children with SEN experience PE in primary school, focusing on what they identify as factors that promote or limit their sense of joy, belonging, and inclusion in movement activities.

Methods: The study draws on qualitative interviews with 53 children with SEN attending Danish primary schools. The interviews were analyzed using thematic analysis, and the emerging themes were further examined through Wenger’s theory of social learning. The analysis is part of the larger research project “Moving PE – for children with special needs in school and leisure time” which focuses on providing children with SEN positive experiences in PE through the integration of co-teaching.

Results: Three key themes were identified: Experiences of PE as a school subject, teacher support, and children’s participation in decision-making. The analysis shows that many children with SEN describe PE as their favorite subject, where they can express themselves physically, and feel competent in ways that academic subjects rarely allow. However, others report feeling marginalized, particularly when lessons take place in large, noisy groups, when they struggle with bodily coordination, or when teachers fail to notice, guide, or include them meaningfully.

Conclusion: Children with SEN have diverse and sometimes contrasting experiences of PE. Some feel seen, supported, and motivated, while others experience exclusion or invisibility. Meaningful inclusion in PE requires adaptable and reflective teaching, sustained teacher support, and involvement of children in planning and decision-making to ensure participation for all. This study contributes to the field by bringing forward children with SEN’s own perspectives on inclusion in physical education. It adds to ongoing discussions on how teaching practices and child participation can foster more equitable and meaningful PE experiences for all children.

SO.3.29-01

Promoting Health Behavior after Childbirth in Migrant Women: A Qualitative Exploration of Challenges and Opportunities

M. Shirvanifar¹, A. Salah Ahmed¹, M. Leksell¹, J. Wangdahl^{2,3,4}, U. Müssener¹, P. Henriksson¹, A. Seiterö¹

¹Linköping University, Health, Medicine and Caring Sciences (HMC), Linköping, Sweden, ²Karolinska Institutet and Stockholm University, Aging Research Center, Stockholm, Sweden, ³Karolinska Institutet, Division of Nursing, Department of Neurobiology, Care Sciences, and Society, Stockholm, Sweden, ⁴Uppsala University, Department of Public Health and Caring Sciences, Uppsala, Sweden

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors
Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The period after childbirth is a critical period for long-term health and wellbeing, particularly among migrant women who face increased risks of weight retention and lifestyle-related diseases. Despite the potential of mobile health (mHealth) interventions to support healthy behaviors, migrant women remain underrepresented in this research area. This study aimed to explore Arabic- and Somali-speaking migrant women’s perspectives on physical activity and diet after childbirth, as well as their views on the potential of mHealth applications to support these behaviors.

Methods: We conducted semi-structured, audio-recorded interviews with 20 purposefully recruited Arabic- and Somali-speaking migrant women who had given birth within the past ten years. Transcripts were analyzed using

SHORT ORALS

qualitative content analysis guided by the COM-B model and the Theoretical Domains Framework. Coding and framework-based analysis were triangulated among three analysts to ensure consistency and depth.

Results: Preliminary results indicate that participants often entered the period after childbirth without reflecting on how their lifestyle habits—such as diet and physical activity—were influenced by their new environment which influenced their capability to deliberately adopt healthy behaviors. Their focus was primarily on the child's wellbeing, with limited attention to their own health. Advice from older female relatives sometimes provided them with the opportunity to reflect on their own habits, particularly regarding what they ate and how their dietary patterns could affect both their own and their infant's health.

Participants further expressed strong motivation to “feel well and be a good parent.” Building small daily routines, receiving practical guidance, and learning about supportive local resources were perceived as key motivators for establishing healthy habits.

Conclusion: This study provides a nuanced understanding of factors shaping migrant women's ability to adopt healthy lifestyle behaviors after childbirth. The findings support the application of theory-based frameworks in multicultural maternal health care and underscore the importance of tailoring interventions to conditions commonly experienced by foreign-born women. Such knowledge can also inform the design of equitable, culturally adopted mHealth interventions to promote sustainable health behaviors and reduce long-term risk of chronic disease.

SO.3.29-02

Rethinking MVPA Estimation: Is Human Activity Recognition a Viable Option over Cut-points?

J. Heidler¹, C. Lendt^{2,3}, M. Eghøj¹, J. Schipperijn¹

¹University of Southern Denmark, Department of Sport Science and Clinical Biomechanics, Odense, Denmark, ²University of Regensburg, Department of Epidemiology and Preventive Medicine, Regensburg, Germany, ³Auckland University of Technology, School of Sport and Recreation, Auckland, New Zealand

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The public health message is simple: 150 minutes of weekly Moderate-to-Vigorous Physical Activity (MVPA), defined by real-world activities like brisk walking, cycling, and running. However, the research implementation is absurdly convoluted. We strap on accelerometers, convert the data into abstract metrics like „counts,“ and apply thresholds derived from a few dozen healthy people on treadmills with oxygen masks. This creates a nonsensical feedback loop: we inform participants they have failed to meet an MVPA guideline, then advise them to perform the very activities our methods were incapable of directly measuring. What if we skipped the middleman entirely? This means abandoning abstract metrics like counts, or Mean Amplitude Deviation (MAD) and, most importantly, abolishing arbitrary cut-points. In this paradigm, the logic is refreshingly simple: cycling is MVPA, running is VPA. Period.

Methods: We compared two approaches to MVPA quantification using publicly available datasets from adults wearing thigh- and hip-mounted accelerometers: a simple logic-based Human Activity Recognition (HAR) model versus traditional cut-point estimates (counts, MAD). To assess real-world validity, the HAR method was evaluated against its ground-truth (indirect calorimetry) to determine how effectively it provides a real-world translation connecting the clinical guideline, the technical assessment, and actual human behaviour.

Results: The simple HAR approach and traditional cut-point methods showed significant differences in MVPA estimates. While a MAD-based cut-point method achieved substantial agreement with HAR (Cohen's Kappa $\kappa = 0.77$), a counts-based method showed only moderate agreement ($\kappa = 0.46$). Critically, when validated against indirect calorimetry, the HAR method proved highly effective, with F1-scores of 0.97 for sedentary behaviour and 0.85 for MVPA. Its primary limitation was in distinguishing LPA (F1-score: 0.26), resulting in an overall accuracy of 76% ($\kappa = 0.64$).

Conclusion: Our findings demonstrate that a simple HAR approach is a valid and substantially agreeable alternative to established cut-point methods for estimating MVPA, excelling at identifying activities that are most important for public health guidelines. This paradigm shift offers a more logical and translatable method for assessing real-world physical activity. Could this be a viable alternative?

SO.3.29-03

Technology-supported Shared Decision-making and Goal-setting to Increase Levels of Physical Activity in Patients with COPD and Complex Chronic Conditions in the RE-SAMPLE Virtual Companionship Program

R. Vaseur¹, A. Middelweerd¹, C. Lopes Pais¹, E. Warmerdam¹, M. Tabak^{1,2}

¹University of Twente, Biomedical Signals and Systems, Enschede, Netherlands, ²Ziekenhuisgroep Twente (ZGT), Almelo, Netherlands

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The growing number of patients with Chronic Obstructive Pulmonary Disease (COPD) and Complex Chronic Conditions (CCCs) calls for an integrated, personalized, and holistic approach to care. The Horizon 2020 RE-SAMPLE-project addressed this by combining real-world data monitoring with personalized predictions of CCC exacerbation risk, embedded in an eHealth programme, the Virtual Companionship Programme (VCP). The VCP included a Virtual Companion offering a multi-morbid action plan and coaching modules for physical activity (PA), medication adherence, and sleep. Healthcare providers (HCPs) used a clinical dashboard with data visualizations, predictions, and a technology-supported shared decision-making (SDM) tool to facilitate collaborative goal setting. This study evaluated the SDM-process and goal achievement within the RE-SAMPLE-programme.

Methods: Patients with COPD and at least one comorbidity or multiple risk factors were included from Italy, the Netherlands, and Estonia between July 2023 - February 2024. Adults (≥ 40 years), current or former smokers, with internet access and language proficiency, were included. Participants used Garmin Vivosmart4 to monitor PA and received tailored coaching messages. Descriptive analysis was used to analyse the goal-setting. The SDM-Q9 and Patients' Preference for Control (PPC) questionnaires were used to evaluate the SDM process (mean $\pm$ SD), and HCPs provided structured feedback. Bland-Altman analyses were used to examine the levels of agreement between patients and HCPs regarding the patient preferences for SDM.

Results: 122 patients (aged 70.1 ± 5.9 , 79% male) were included, of them 113 received coaching messages. Most goals ($n=119$) focused on PA, with the remainder on medication adherence. Short-term goals primarily involved walking; 90 patients set personalized goals, and 26 used standard options. Across all PA goals, 145 daily step, 6 daily intensity, and 11 weekly intensity targets were set. Overall, 53% of goals were achieved. The mean SDM-Q9 score was 38.5 ± 8.9 , indicating a positive SDM experience. Bland-Altman-analysis showed a mean difference of -0.49 (95%CI: -3.46 : $+2.48$), suggesting HCPs perceived patients preferred more control than patients reported. HCPs found SDM forms complex, repetitive, and time-intensive.

Conclusion: Technology-supported SDM must be user-friendly, time-efficient, and adaptable to patient needs. Enhancing preference elicitation, information presentation, and tool usability is essential to improve feasibility and impact in routine COPD care.

SO.3.29-04

The Landscape of Accelerometer-derived Signal Metrics

A. Abdelazeem¹, V. Farrahi¹

¹TU Dortmund, Research Group of Data Analytics in Sport Science, Institute of Sports and Sports Science, Dortmund, Germany

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Wearable accelerometers capture continuous signals that reflect multiple dimensions of human physical behavior. In recent years, numerous signal-derived metrics—such as ENMO, Intensity Gradient, Amplitude Index, Gini Index, and α -Exponent—have been proposed to characterize physical behavior in terms of volume, intensity, temporal distribution, pattern, and variability. However, the rapid expansion of available metrics and inconsistencies in their quantification have resulted in conceptual overlap and uneven interpretation across studies. This work aims to review and classify existing accelerometer-derived metrics according to their conceptual meaning and computational approach, providing a clear framework to support their quantification and interpretation.

Methods: We surveyed the existing literature and conducted a metric audit to identify signal-derived metrics used in

SHORT ORALS

accelerometer research. Metrics were categorized along two dimensions: (1) conceptual foundations—volume, time, pattern, and variability—and (2) computational level, including raw, epoch-based, daily, and aggregated calculations. Each metric was described mathematically, and its interpretative meaning was summarized based on examples from studies that proposed or applied it.

Results: More than 30 distinct metrics were reviewed and summarized. Most of these metrics were describing volume and time-related characteristics (~20 metrics), with smaller groups addressing pattern-related features (~7–9 metrics) and variability-related features (~5–7 metrics). Although several metrics were mathematically related, they differed in terminology, scaling, and computational level. Some metrics could be derived at multiple levels—such as epoch or daily—depending on the analytical context. For each metric, we documented its mathematical formulation and discussed the interpretative meaning of values using examples from the literature.

Conclusion: This study provides a structured overview and taxonomy of accelerometer-derived metrics, offering a practical reference for researchers interested in processing accelerometer signals into meaningful measures. Given the limited documentation on how these metrics should be quantified, our work consolidates dispersed information to support consistent computation and interpretation. Overall, this paper introduces key accelerometer-derived metrics and offers guidance to facilitate their applications in physical behavior research.

SO.3.29-05

Intervention on Unstructured Recess Physical Activity among Primary School Students Based on Existing Spatiotemporal Resources

Y. Liu¹, Y. Yan¹

¹Shanghai University of Sport, School of Physical Education, Shanghai, China

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Recess in school is considered to be an important opportunity to promote physical activity (PA) for students. Unstructured recess provides students with opportunities for PA. However, the activity space is limited in many Chinese urban primary schools which constrain students' PA during recess. Therefore, the purpose of this study is to designed and implemented an unstructured recess PA intervention for primary school students using spatial analysis techniques in limit spatiotemporal resources in schools.

Methods: A within-subject design was used to test the effectiveness of the intervention in the study. Two primary schools in Shanghai were selected for one month intervention with different per capita playground areas ($>2.3 \text{ m}^2/\text{person}$ and $<2.3 \text{ m}^2/\text{person}$). All students in Grades 3-5 participated in the intervention. For PA measurement by accelerometers, 120 students (mean age = 9.72 years; 52.5% boys) were selected using a cluster random sampling method. The intervention is increasing activity equipment and facilities. Geographic Information System (ArcGIS) was employed to determine the spatial layout of activity equipment/facilities. Subsequent analysis using space syntax (Depthmap) was conducted to assess the visual integration. Pedestrian simulation (AnyLogic) was employed to verify the temporal and spatial utilization efficiency of students' activities during the intervention. Paired-sample t-tests were conducted to compare differences in recess PA before and after the intervention. A generalized linear regression model was applied to examine the intervention effects, controlling for gender, BMI, grade, activity level, and recess duration.

Results: Both the duration (before vs after: 6.26 vs. 7.12 min, $p < 0.001$) and percentage (14.33% vs. 16.31%, $p < 0.01$) of MVPA during unstructured recess increased. After controlling covariates, students' MVPA duration ($\beta = 0.86$, 95% CI [0.048, 1.68], $p < 0.05$) and MVPA percentage ($\beta = 1.98$, 95% CI [1.66, 2.31], $p < 0.01$) increased after intervention.

Conclusion: Under existing spatiotemporal resources, an intervention designed using spatial analysis techniques was effective in increasing students' unstructured recess PA in primary schools with limit space. This study provides an new way to promote students' PA using new technology.

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors
Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: There is a transition from survey- to device-based assessments of physical activity, and smartphones may be a more convenient and less costly alternative than research-grade accelerometers. It remains unclear whether physical activity descriptors obtained from smartphones are comparable to those obtained from a research-grade accelerometer in healthy adolescents. We aimed to (i) compare two acceleration summary metrics (Activity Counts (AC) and the Euclidean Norm Minus One (ENMO)), and the derived physical activity descriptors between a smartphone and a research-grade accelerometer, and (ii) compare the impact of using two different data-processing pathways (based on either AC or ENMO) to derive these physical activity descriptors.

Methods: Sixty-four (48% female) European adolescents with a median [P25-P75] age of 15.1 [13.9-16.1] years simultaneously wore a smartphone (Samsung Galaxy A20e) and research-grade accelerometer (ActiGraph wGT3X-BT) placed on the waist for one week during waking hours. Five physical activity descriptors (i.e., inactive time, time spent in low, moderate (MPA), vigorous, and moderate-to-vigorous (MVPA) intensity physical activity) were obtained from both devices through either the AC or ENMO pathway. We used scatterplots, absolute and relative errors, Spearman correlations, intraclass correlation coefficients (ICC) and Bland-Altman plots to compare (i) summary metrics (AC and ENMO) and physical activity descriptors between devices; and (ii) physical activity descriptors between data-processing pathways.

Results: The device comparison showed large absolute and relative errors (e.g., mean absolute percent errors (MAPE): 20%-182%, except for inactive time: $\leq 14\%$), moderate-to-strong correlations (ρ : 0.58-0.94) and good-to-excellent agreement (ICC: 0.72-0.99) for both summary metrics and physical activity descriptors. Inactive time was the most comparable descriptor. The pathway comparison showed large errors (e.g., MAPE: 45%-166%), weak correlations (ρ : 0.07-0.58; except for inactive time and smartphone-derived MPA and MVPA: $\rho \geq 0.66$), and poor-to-excellent agreement (ICC: 0.05-0.91).

Conclusion: Absolute values of smartphone-derived summary metrics and physical activity descriptors were generally not comparable to those obtained from a research-grade accelerometer (except for inactive time), despite the moderate-to-strong correlations and good-to-excellent agreement between devices. None of the physical activity descriptors was comparable between processing pathways. This shows that the choice of device and processing pathway strongly impacts physical activity descriptor values in adolescents.

SO.3.29-07

Engaging a Nation: Who Joins and Who Stays in a Digital Population-wide Physical Activity Intervention with Two Million Participants?

S.Y.X. Tan¹, K. Jin¹, E. Semenova², S. Mishra¹, F. Müller-Riemenschneider^{1,3}

¹National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, ²Imperial College London, London, United Kingdom, ³Charité – Universitätsmedizin Berlin, Digital Health Centre, Berlin Institute of Health, Berlin, Germany

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors
Room 4, May 30, 2026, 10:00 AM - 11:00 AM

SHORT ORALS

Purpose: The National Steps Challenge (NSC), initiated by Singapore's Health Promotion Board in 2015, is one of the largest national digital physical activity interventions worldwide. Given the growing recognition that large-scale interventions may not engage all groups equally, we examined NSC participation across six seasons (2015–2021) to understand reach, sustained engagement, and differences across key sociodemographic groups.

Methods: We linked all NSC registrants from season 1–6 to national registry data to obtain sociodemographic characteristics. Individuals who recorded valid step data (mean >1,000 steps/day) in at least one season were considered to have ever participated in NSC and were classified as: 'One-timers' (1 season), 'Repeat' participants (2–4 seasons), and 'Loyal' participants (5–6 seasons). We used multivariable logistic regression to identify characteristics associated with being a 'Repeat' or 'Loyal' participant (versus 'One-timer').

Results: NSC attracted 1,809,743 registrants across six seasons, thereby reaching approximately 51% of the Singapore population aged ³17 years. Registrants were aged 43.3±16.2 at first sign up, were mostly females (54.4%), of Chinese ethnicity (84.3%), and of higher per capita household income (>\$3100, 42.8%). Among them, 1,090,526 participated in at least one season (60.3%). Most were 'One-timers', (48.6%, n=529,626), 45.9% were 'Repeat' participants (n=501,048), and 5.5% were 'Loyal' participants (n=59,852). Females (1.27 [1.26, 1.28]), older adults ³40 to 59 years (1.33 [1.32, 1.34]) and ³60 to 79 years (1.35 [1.34, 1.37]), and those of higher per capita household income (\$1201–2000 OR = 1.32 [1.30, 1.33], \$2001–2800 OR = 1.52 [1.50, 1.54], \$2801–3100 OR = 1.64 [1.60, 1.67], >\$3100 OR = 1.80 [1.78, 1.82]) were more likely to be 'Repeat/Loyal' participants, while non-Chinese (Malays OR = 0.41 [0.40, 0.42], Indians OR = 0.50 [0.49, 0.51], Others OR = 0.60 [0.58, 0.62]) and older adults aged ³80 years (0.78 [0.74, 0.82]) were less likely to be 'Repeat/Loyal' participants.

Conclusion: Although NSC achieved substantial population reach, sustained participation differed across social groups. This highlights that large-scale digital public health interventions may unintentionally widen physical activity and health inequalities within the population, requiring tailored strategies to support equitable, long-term engagement in large-scale digital physical activity programmes.

SO.3.29-08

Effectiveness of Digital Tools on Lifestyle & Health-related Outcomes across the Full Continuum of the Maternal Journey: A Systematic Review

D. Sigala¹, P. Chaudhary², T. Schroder¹, Z. van der Heijden³, M. Afeiche¹, A. Staiano², **M. F. Vasiloglou¹**

¹Nestlé Research, Nestle Institute of Health Sciences, Lausanne, Switzerland, ²Louisiana State University, Pennington Biomedical Research Center, Baton Rouge, United States, ³Wageningen University & Research, Division of Human Nutrition and Health, Wageningen, Netherlands

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors
Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Maternal health is a global public health priority and a key determinant of generational and societal well-being. Emerging digital technologies, including mobile applications, telehealth, and chatbots, offer innovative opportunities to promote healthy lifestyle behaviors across the maternal continuum (preconception, pregnancy, and postpartum). Despite growing use and acceptance of these tools, the evidence supporting their effectiveness in optimizing maternal lifestyle and health outcomes remains limited and fragmented. This systematic review aimed to assess the effectiveness and characteristics of digital tools targeting lifestyle and health-related outcomes across the maternal journey.

Methods: Following the PRISMA 2020 guidelines and PROSPERO registration (CRD420251075108), comprehensive searches were conducted in PubMed, Scopus, Web of Science, and CENTRAL for randomized controlled trials (RCTs) published between January 2020 and May 2025. Eligible studies involved digital interventions targeting at least one of the CDC-defined lifestyle parameters (nutrition, physical activity, sleep, smoking, alcohol consumption) among women during preconception, pregnancy, or up to six months postpartum. Data were extracted independently by multiple reviewers, and risk of bias was assessed using the RoB 2 tool.

Results: Thirty-one RCTs (n = 7,153 women) were included, primarily conducted during pregnancy (n=20) and postpartum (n=15), with fewer in preconception (n=3). Digital interventions showed beneficial effects on nutrition (e.g., improved dietary intake, micronutrient supplementation), physical activity, sleep quality, and insomnia during pregnancy. Consistent reductions in gestational weight gain were observed among women with overweight/obesity, though general population effects were limited. Postpartum and preconception interventions demonstrated modest or inconsistent outcomes, particularly for anthropometrics and metabolic markers. Reminders (64.5%), self-monitoring (58.1%), and goal-setting (48.4%) were the most prevalent features across tools, while engagement

SHORT ORALS

reporting remained inconsistent.

Conclusion: Digital health tools exhibit significant potential for improving select lifestyle behaviors, particularly during pregnancy, and ongoing research may reveal more insights into sustained or postpartum benefits. Heterogeneity in intervention design, high risk of bias, and limited representation from low- and lower-middle-income countries constrain generalizability. Future research should prioritize rigorous, long-term, and equity-focused RCTs with standardized measures and engagement metrics to optimize digital strategies for maternal health promotion.

SO.3.29-09

A Dual-level Framework for Evaluating Student Experiences with Digital Health Interventions in University Settings

M. Movia^{1,2}, M. Chen¹, S.Y.X. Tan¹, X.H. Chua¹, K. Jin¹, N. Padmapriya¹, S. Zheng¹, T. Topothai¹, S.M. Edney¹, F. Müller-Riemenschneider^{1,3}

¹Saw Swee Hock School of Public Health, National University of Singapore and National University Health System, Singapore, Singapore, ²Celia Scott Weatherhead School of Public Health and Tropical Medicine, Tulane University, New Orleans, United States, ³Digital Health Centre, Berlin Institute of Health, Charité – Universitätsmedizin Berlin, Berlin, Germany

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Digital health interventions for university students require evaluation approaches that capture both their direct experiences and broader contextual factors. Existing evaluation tools predominantly focus on either technology acceptance or clinical outcomes, without capturing students' direct experiences and the broader contextual factors that shape their health behaviors. This study presents a novel dual-level evaluation framework for assessing student experiences with digital health interventions using the MOVE@NUS pilot as a case study.

Methods: This study employed a mixed-methods design to develop and test the evaluation framework in a pilot digital health intervention targeting sleep, physical activity, and screen time among first-year undergraduates in Singapore (N=65). The framework integrates elements from established models (i.e., TAM, COM-B, MARS, social/digital determinants of health) to structure data collection. The dual-level framework comprises: (1) a micro level assessing intervention-specific feedback, technology user experience, and program engagement; and (2) a macro level examining capability factors (health and digital literacy), opportunity factors (physical and social environment), and motivational elements (participation drivers, engagement). Data collection included semi-structured interviews and sequential surveys across multiple timepoints. Analysis combined descriptive statistics for quantitative data and thematic analysis for qualitative data.

Results: The framework provides a comprehensive structure through its dual-level approach and demonstrated its ability to capture detailed experiences and broader contextual influences. Baseline surveys (n=41), exit surveys (n=54), and post-intervention feedback surveys (sleep: 18/36, physical activity: 16/44, screen time: 18/44) were collected, alongside 22 qualitative interviews. Micro-level findings revealed personalization and clear communication as key to positive experiences, while technical issues and academic pressures were common barriers. Macro-level analysis showed students' engagement and health behaviors were shaped by academic schedules, living contexts, and digital proficiency. The framework successfully captured both breadth and depth of contextual understanding.

Conclusion: This theory-driven framework offers a structured evaluation approach applicable for assessing digital health interventions targeting student populations. Unlike existing tools, it uniquely integrates personal experience with external determinants of health behavior, providing complementary insights that neither quantitative nor qualitative methods alone could achieve. The framework is freely adaptable and enables a more comprehensive evaluation of how digital interventions can support healthy behaviors in young adults.

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: While increased physical activity (PA) is universally recognised for its health benefits in individuals living with chronic health conditions, there is a gap in condition-specific reference values. Such values would enable meaningful evaluation of PA volume and intensity in these heterogeneous populations. This study aims to utilise accelerometer data from a large-scale dataset to define age- and sex-referenced PA centiles specific to distinct patterns of health conditions, establishing a rigorous foundation for personalised PA prescription.

Methods: This analysis will include UK Biobank participants (aged 40–71 years) with valid wrist-worn accelerometer data (Axivity AX3, ≥ 72 h wear). Volume and intensity will be characterised by average acceleration and intensity gradient (IG). Health conditions will be selected using medical diagnosis codes (ICD-10, and ICD-9) and self-reported conditions (UK Biobank Data Coding 6). Latent Class Analysis (LCA) will be applied to investigate distinct groupings of health conditions. Age and sex specific centile curves for average acceleration and IG will then be generated for each health condition group and LCA-derived groups using Generalised Additive Models for Location, Scale, and Shape (GAMLSS). PA metrics will be modelled across age using parametric distributions, with the optimal distribution selected based on the model with the lowest Akaike Information Criterion (AIC).

Results: The initial dataset comprises 103,582 participants of whom 78,331 have at least one health condition and will be integrated into the LCA. Subsequent analysis using GAMLSS will generate age- and sex-referenced centile curves (10th to 90th percentiles) for average acceleration and IG across all derived health conditions and identified patterns. Full statistical results and the definitive centile curves will be presented.

Conclusion: These condition, age and sex specific PA centiles will provide essential, data-driven benchmarks that will facilitate meaningful interpretation of accelerometer data in people with chronic health conditions. This will, move PA prescription for people living with chronic disease beyond generic guidelines toward meaningful, personalised targets for improved clinical outcomes and advancing behavioural change methods.

SO.3.29-11

Effects of a Live-remote Supervised Exercise Intervention for Cancer Survivors: The EX-MED Cancer Sweden Randomised Controlled Trial

M. Kotte¹, K. Bolam², P. Cormie³, R. Altena⁴, S. Mijwel¹, Y. Wengström¹

¹Karolinska Institutet, Department of Neurobiology, Care Sciences and Society, Stockholm, Sweden, ²Baker Heart and Diabetes Institute, Cardiometabolic Health and Exercise Physiology Lab, Melbourne, Australia, ³The University of Melbourne, Sir Peter MacCallum Department of Oncology, Melbourne, Australia, ⁴Karolinska Institutet, Department of Oncology and Pathology, Stockholm, Sweden

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Exercise offers important benefits for cancer survivors; however, participation remains low due to barriers such as time constraints, distance, and limited availability of suitable services. Supervised live-remote delivery may overcome these barriers while retaining professional support. This trial evaluated the effects of a 12-week live-remote supervised exercise intervention on health-related quality of life (HRQoL) and other patient-reported and physiological outcomes in survivors of breast, prostate, and colorectal cancer.

Methods: Between January 2022 and December 2023, 200 participants (mean age = 58.5 ± 10.4 years; 62% women) were randomised to either a live-remote exercise intervention or usual care. Half had been treated for breast cancer, 23% for prostate, and 26% for colorectal cancer; 52% had received chemotherapy, and 41% were receiving endocrine therapy. The intervention comprised twice-weekly, 60-minute virtual group sessions (≤ 8 participants) led by upskilled personal trainers for 12 weeks. Outcomes were assessed at baseline, post-intervention (3 months), and 6 months. The primary outcome was overall HRQoL (EORTC QLQ-C30). Secondary outcomes included physical functioning, cardiorespiratory fitness (VO_2max), strength, and physical activity. Exploratory analyses examined moderators including sex, endocrine therapy, age, cancer type, and baseline health status.

Results: Median session attendance was 75%, with no serious adverse events. No between-group difference was found for overall HRQoL. However, compared with controls, the intervention group showed greater improvements at 3 months in self-reported physical functioning (ES = 0.31, $p \leq 0.001$), sit-to-stand performance (ES = 0.22, $p = 0.003$),

SHORT ORALS

VO₂max (ES = 0.12, p = 0.045), upper body strength (ES = 0.17, p = 0.010), and physical activity (aerobic ES = 0.57, p < 0.001; resistance ES = 1.03, p < 0.001). Most effects were not maintained at 6 months. Endocrine therapy and sex significantly moderated several outcomes, with women and participants receiving endocrine therapy showing greater gains in HRQoL, fatigue, and strength. Participants with lower baseline HRQoL or fitness derived greater benefit.

Conclusion: A 12-week live-remote exercise intervention led to short-term improvements in physical activity, function, fitness, and strength, with no effect on HRQoL. Most gains diminished by six months. Participants with lower baseline health, women, and those on endocrine therapy appeared to derive greater benefit.

SO.3.29-12

How Does the UK Food Supply Shape up? Food Quality Measures and Nutrient Intakes Using myfood24

J. Cade¹, G. Williams², L. Clarkson²

¹University of Leeds, School of Food Science and Nutrition, Nutritional Epidemiology Group, Leeds, United Kingdom,

²Dietary Assessment Ltd, Leeds, United Kingdom

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Assessment of nutrient intakes and diet quality relies on accurate, detailed food composition tables. High in Fat, Salt and Sugar (HFSS) foods and NOVA scores (for food processing) have been linked to health.

Our objective was to compare estimates of HFSS and NOVA scores in the branded UK food composition database from myfood24. Identifying food categories where there was agreement and disagreement between classifications.

Methods: myfood24 is an online diet assessment tool used in research in over 20 countries. The UK food composition database contains back of pack nutrition information/100g product for branded and generic foods. Diet quality measures HFSS and NOVA were calculated using standard algorithms. Scores were allocated using ingredient decks. Some assumptions were made for NOVA scoring, items with preservatives were given a score of 4 (ultraprocessed). Food categories and nutritional content of products were compared.

Results: 89,496 UK branded foods had both HFSS and NOVA scores calculated from 32 food groups. Prepared meals and meat/poultry both provided 11% and cakes/sweet bakery 9% of total products. Of 76k foods classified as NOVA4 only 53% were also HFSS.

Food groups with the largest numbers of foods scored as non-HFSS and NOVA4 scores were 28% canned/tinned foods; 16% fish/seafood; 78% fruit juices/smoothies; 18% nuts/seeds; 18% pulses. Food groups with both HFSS and NOVA4 as the majority classification were bread, breakfast cereals, cakes/sweet bakery, canned/tinned foods, confectionary, dairy/eggs, fried food, jams/honey, meat/poultry, pies/pasties, pizza/pasta, prepared meals, savoury snacks, soft drinks/squash, soups/salad/sandwich.

Nutritional composition varied between scores. Mean energy for HFSS was 355kcal/100g and NOVA4 was 250Kcal/100g. Foods which were both HFSS and NOVA4 had nutrients/100g which were all higher than non-HFSS and NOVA4. Mean energy of 348 v. 144kcal/100g, protein 9 v. 7g/100g, carbohydrates 37 v. 17g/100g, total sugar 19 v. 4g/100g; fat 18 v. 5g/100g respectively.

Conclusion: HFSS and NOVA scores are *not* measuring the same concepts. HFSS and NOVA4 classifications show considerable variation in nutritional composition. Understanding where the differences and similarities lie between the scores can help interpret epidemiological research and develop public health policy to improve the quality of the UK diet.

SO.3.29-13

App4Support: Enhancing Pedagogical Skills of Youth Coaches with the Help of a Mobile App Developed via a Social Design Approach

M. de Greeff¹, J. Moeijes¹, S. Bakker², P. Terpstra³, L. Thewissen⁴, E. Hartman⁵

¹University of Applied Sciences Windesheim, Research group Movement, Health and Well-being, Zwolle, Netherlands,

²Mingle Sports, Utrecht, Netherlands, ³University of Applied Sciences Windesheim, Youth Sports Innovation Centre, Zwolle, Netherlands, ⁴Sportservice Zwolle, Zwolle, Netherlands, ⁵University of Groningen, University Medical Center Groningen, Department of Human Movement Sciences, Groningen, Netherlands

SHORT ORALS

SO.3.29 E- & mHealth: Assessment and Evaluation of Movement Behaviors

Room 4, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Organized sports can offer an accessible and cost-effective complement to traditional healthcare. Yet, sports clubs are rarely recognized by healthcare professionals as suitable or preventive settings for children with mild psychosocial problems. The App4Support project seeks to foster behavioral change among youth coaches and enhance a pedagogically supportive sports climate through a practical digital support tool.

Methods: Using a social design approach, App4Support was co-created with youth coaches, parents, sport professionals, and technology partners. Building on a proof-of-concept version, the project progressed through three iterative phases: (1) *needs analysis* to explore challenges faced by coaches and identify situations involving difficult child behavior; (2) *prototype development* to translate insights into an accessible digital tool with realistic examples, practical tips, and explanations of underlying causes; and (3) *testing and feedback* at national meetings and local sports clubs, where coaches used the app and evaluated its usability, clarity, and relevance. Monthly field observations and reflection sessions further examined how the app promotes learning, self-reflection, and collaboration between coaches and psychomotor therapists.

Results: Preliminary findings show that coaches highly valued the app's focus on recognizable coaching situations and appreciated its combination of practical strategies, contextual explanations, and opportunities for professional exchange. Gamification features (e.g. progress tracking and quiz pop-ups) appear to enhance user engagement. Furthermore, the integrated collaboration platform connecting youth coaches and psychomotor therapists fosters a sense of shared learning and professional community, supporting continuous reflection and skill development in everyday coaching practice.

Conclusion: App4Support illustrates how co-creative, practice-based innovation can translate pedagogical knowledge into a m-health tool that empowers and connects youth coaches and psychomotor therapists. The upcoming phase will involve large-scale field evaluation to assess behavioral outcomes and the app's potential to strengthen pedagogically supportive sports environments.

SO.3.30-01

Exercise Prescription and Behaviour Change Techniques in Prehabilitation Programs for Solid Organ Transplant: A Scoping Review

J. Sim¹, K. Fougere², E. McLaughlin¹, G. Puloski³, M. McIntosh¹, E. Cowan⁴, J. Daun^{1,2}, K. Schneider^{1,5}, K. Burak^{6,7}, S.N. Culos-Reed^{1,7,8}

¹University of Calgary, Faculty of Kinesiology, Calgary, Canada, ²University of Calgary, Cumming School of Medicine, Calgary, Canada, ³Queen's University, Faculty of Health Sciences, Kingston, Canada, ⁴Western University, Faculty of Health Sciences, London, Canada, ⁵University of Calgary, Concussion Rehabilitation Lab and Sport Injury Prevention Research Centre, Faculty of Kinesiology, Calgary, Canada, ⁶University of Calgary, Department of Medicine, Cumming School of Medicine, Calgary, Canada, ⁷University of Calgary, Department of Oncology, Cumming School of Medicine, Calgary, Canada, ⁸Arther J.E. Child Comprehensive Cancer Centre, Department of Psychosocial Resources, Calgary, Canada

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Transplantation is the gold-standard treatment for individuals with end-stage organ failure. Pre-surgical exercise, or prehabilitation, is a safe and effective modality that may improve pre- and post-surgical outcomes. However, little work has defined exercise prescription parameters, and no work has identified the behaviour change strategies employed in interventions. Thus, a scoping review was conducted to bridge the fields of transplant prehabilitation and behavioural science through identifying and characterizing exercise prehabilitation programs.

Methods: MedLine, CINAHL, EMBASE, Web of Science, PsychInfo, and SportDiscus were systematically searched for exercise prehabilitation programs. Identified records were uploaded to Covidence for title/abstract and full-text screening. Titles/abstracts were independently reviewed by two authors against inclusion/exclusion criteria. Potentially relevant sources were then independently read in their entirety by two authors to determine if eligible for extraction. Data was extracted using the TIDieR checklist and Behaviour Change Technique (BCT) Ontology. Extracted information was analyzed using narrative synthesis and descriptive statistics.

Results: A total of 77 exercise prehabilitation programs described across 97 publications were included in this review. The majority of programs were for lung transplant (39%) followed by heart (25%), liver (18%), kidney (14%),

SHORT ORALS

and multiple organ types (4%). Fifty-four reported sufficient information to characterize the exercise intervention using the Frequency, Intensity, Time, Type (FITT) principle. The most frequent modality of exercise was combined resistance and aerobic training (39%). Thirteen studies (17%) included some education or behavioural counseling. Sixty-six studies (86%) reported enough information to extract at least one BCT. The number of BCTs extracted ranged from 0-14 with the most frequent number of BCTs extracted being one (19%), and most coded BCT being “practice behaviour BCT BCIO:007094”.

Conclusion: As transplantation numbers continue to rise, there is a greater need to address patient wellness in the pre-transplant period. However, limited reporting on exercise prescription components prevents summarizing across programs to determine beneficial exercise prescription components (i.e., dose, intensity, type). Additionally, comprehensive reporting of strategies used to support participant exercise behaviour remains sparse. Understanding what techniques have been used to support patient exercise behaviour pre-transplant can help future work build effective interventions to support long-term exercise behaviour and patient wellness.

SO.3.30-03

Supporting Sustained, At-scale Delivery of a Parent-focused Intervention: Insights from the INFANT Program

I. Katiforis^{1,2}, R. Laws^{1,2}, D. Duric¹, S. Spiteri^{1,3}, M. Adam¹, H. Koorts¹, K. Hesketh¹, P. Love¹

¹Deakin University, Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Melbourne, Australia, ²NHMRC Centre of Research Excellence in Translating Early Prevention of Obesity in Childhood (EPOCH-Translate CRE), Sydney, Australia, ³Western Health, Department of Nutrition and Dietetics, Sunshine, Australia

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Early childhood is a critical window for establishing healthy behaviours that support lifelong health and wellbeing. Parent-focused interventions promoting healthy feeding and active play are important for achieving this goal. The INFANT program is an evidence-based program delivering group sessions for parents and caregivers during the child's first year of life, with session content reinforced through a mobile app. Since its statewide scale-up in Victoria, Australia, in 2021, rates of sustained delivery have varied, underscoring the importance of embedding the program in routine practice. This study explored the perspectives of INFANT-trained coordinators and facilitators on factors influencing the sustained, at-scale implementation of INFANT within their organisations.

Methods: A multi-site, qualitative exploratory study was conducted between 2022 and 2024. In-depth, semi-structured interviews were undertaken at 12-months (n=15) and 24-months (n=8) post-completion of the INFANT training. Interviews were audio-recorded and transcribed verbatim. Data were analysed using thematic analysis, informed by the Implementation Strategies Applied in Communities (ISAC) compilation, to identify barriers and enablers to the sustained implementation of INFANT at scale.

Results: Coordinators and facilitators were interviewed from 15 of the 34 local government areas implementing the INFANT program at the time of the study. All interviewees (n=19) were female. One third (32%) were Maternal & Child Health Nurses and the majority (68%) employed within local government organisations. Sustained program delivery was supported by strategies clustered into five overarching themes: (1) leveraging partnerships, funding, and community connections; (2) providing structured guidance and resources; (3) adapting and tailoring INFANT to meet parents' needs and contexts; (4) equipping and empowering facilitators to deliver INFANT; and (5) monitoring delivery through pragmatic evaluation and technology.

Conclusion: While implementation strategies collectively supported the sustained delivery of the INFANT program, most relied on individual and organisational efforts, with inconsistent funding and limited workforce capacity presenting key barriers. Findings from this study highlight the urgent need for additional systems-level support to strengthen the organisational capacity to embed the INFANT program into routine practice, ensuring its sustained implementation at scale.

Stepping up to Scale: Organisational Implementation of the 10,000 Steps Program in Victoria, Australia

S. Cassar¹, S. Kaphle¹, F. Parker², E. Rivera¹, A. Van Itallie², J. Ma³, C. Vandelanotte²

¹CQUniversity, Melbourne, Australia, ²CQUniversity, Rockhampton, Australia, ³Deakin University, Melbourne, Australia

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Scalable physical activity programs are essential for addressing population-level inactivity and reducing chronic disease burden. Despite this recognition, few programs have demonstrated sustained implementation. The web- and app-based 10,000 Steps Program is a rare example, successfully implemented across Australia under varying funding models. While the Queensland Government has supported the program for over two decades, Victoria has provided no formal policy support or funding, despite strong organisational and individual uptake. By investigating scale-up in the absence of formal policy and funding, this study offers novel evidence on how organisations mobilise leadership, partnerships, and internal resources to sustain delivery. This study examined how the program has been implemented at scale within diverse settings and organisational contexts across Victoria, identifying enablers and barriers to sustainable delivery.

Methods: A qualitative case study design was employed to examine implementation across 12 Victorian organisations. Data were collected through semi-structured interviews involving 20 participants, including workplace health coordinators, program champions, and senior managers. Interview questions were guided by the WHO ExpandNet “20 Questions for Developing a Scale-Up Strategy,” which provided a structured lens for exploring key domains such as innovation characteristics, user organisation readiness, environmental context, resource team capacity, scale-up strategy, and sustainability. A reflexive thematic analysis approach was used to interpret findings.

Results: Findings revealed that organisations were drawn to the program’s evidence base, free use, ease of use, and alignment with workplace health goals. Leadership support (including staff time and an allocated budget) and internal communication were critical for uptake and sustained engagement. Supportive workplace cultures and informal health policies facilitated integration. Flexible, context-specific implementation strategies helped organisations navigate resourcing constraints. Most organisations expressed intent to continue the program, citing positive outcomes and strategic alignment.

Conclusion: This study demonstrates how evidence-based physical activity programs can be implemented at scale within diverse systems, even without formal policy or funding. It further highlights the important role of organisational leadership, strategic partnerships, and contextual adaptation in achieving sustainable implementation. These insights can inform future efforts to embed the 10,000 Steps Program within Victorian health systems and support advocacy for long-term policy alignment and investment.

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

SHORT ORALS

Purpose: Daily physical activity is essential for health and can complement treatment for people with physical or psychological conditions. Existing initiatives often lack orchestration, making the transition from healthcare to organized sports and/or homebased independent physical activity challenging and hindering a long-lasting impact. To achieve lasting change, a toolbox is being developed with evidence-based implementation strategies and practical guidance supporting healthcare and sports & exercise professionals and policymakers. To provide input for the toolbox, we identified barriers and facilitators for designing, implementing, and securing physical activity journeys.

Methods: This qualitative study consists of two components: 1) a regional needs assessments in 4 Dutch regions and 2) an analysis of national best practices. In both components, we conducted semi-structured interviews or focus group discussions between March and September 2025 with key stakeholders, including healthcare professionals, sports & exercise professionals, social workers, as well as patients (n=92 for Dutch regions; n=13 for best practices). All interviews were audio recorded and summarized. An inductive thematic analysis was conducted to identify barriers and facilitators. Barriers were then matched to implementation strategies with the CFIR-ERIC Implementation Strategy Matching Tool and further operationalized for use in practice.

Results: Barriers and facilitators were categorized into three themes: 1) fundamental design choices (e.g., target group, recruitment channels), 2) design of the physical activity journey (e.g., outreach, intake, coaching, training, referral and follow-up), 3) enabling conditions (e.g., movement friendly environment, knowledge and attitudes of healthcare professionals and patients, purpose-oriented cross-organizational network, long-term funding, contribution patient). Implementation strategies included developing and distributing educational materials, conducting training and educational meetings, identifying and preparing local champions, develop a formal implementation blueprint, building a coalition and creating a learning community.

Conclusion: Insights from this qualitative study were based on a large and diverse group of stakeholders and provided valuable understanding of the factors influencing the design, implementation and sustainability of physical activity journeys. Our embedded research evaluation in the four regions will provide insight in the usefulness of the implementation strategies and the toolbox in supporting long-lasting, patient-centered physical activity pathways that encourage physical activity.

SO.3.30-06

Societal Impact of Micro-exercise for Work-related Musculoskeletal Disorders

L.L. Andersen¹

¹National Research Centre for the Working Environment, Musculoskeletal Health, Copenhagen, Denmark

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Work-related musculoskeletal disorders (MSDs) remain the leading cause of disability globally. This study describes the development and nationwide spread of workplace-based micro-exercise programs over two decades, addressing not only exercise effectiveness but also practical, ideological, and cultural barriers to adoption. Micro-exercises are, for example, brief bouts of strength training with elastic resistance bands targeting the back, neck, shoulders, and arms. The primary research questions examined: (1) what minimal exercise dose effectively reduces MSDs, (2) how to make strength training feasible and culturally acceptable in workplace settings, and (3) societal impact.

Methods: The research performed from 2005-2023 included: (1) laboratory studies using electromyography to compare exercise equipment and muscle activation patterns (n=various samples), (2) randomized controlled workplace trials testing exercise effectiveness across different doses and modalities, (3) a national communication campaign ('Job & Body', 2011-2014) including networking, workplace tours, and mass media outreach, and (4) repeated cross-sectional surveys of representative worker samples tracking adoption rates and register-based follow-up examining sickness absence (n=70,130 workers, 2012-2023). Outcomes included pain intensity, exercise feasibility, adoption rates, and long-term sickness absence.

Results: Initial workplace trials (2008) demonstrated that 3x20 minutes/week strength training significantly outperformed general fitness training and ergonomic advice for chronic neck-shoulder pain. Laboratory studies (2010) validated elastic resistance bands as equally effective as dumbbells. Subsequent workplace trials (2011) demonstrated that just 2 minutes daily of elastic band training performed to muscular fatigue effectively reduced neck-shoulder pain. Following the national campaign, workplace adoption of micro-exercise increased from 15.2% (2012) to 25.2% (2023) of Danish workers. Uptake among workers offered micro-exercise increased from 54.3% to 61.0% (2012-2018). Population attributable fraction estimates revealed that full implementation could potentially

SHORT ORALS

prevent 12.8% of all long-term sickness absence cases nationally.

Conclusion: This research demonstrates successful translation of exercise science into widespread workplace practice by systematically addressing implementation barriers. The increase in workplace adoption during the years represents significant societal impact, with substantial prevention potential. Key lessons include the importance of minimizing time requirements, ensuring cultural acceptability through strategic communication, and continuously adapting research to stakeholder needs. This model provides a framework for translating physical activity research into population-level impact.

SO.3.30-07

Customer Discovery for Scale Up: Enhancing the Adoption and Scalability of Faith in Action

E. Arredondo¹, M. Torres-Ruiz², C. Costa¹, M. Gomez¹, L. Perez³, J. Schneider², J. Haughton⁴

¹San Diego State University, Department of Psychology, San Diego, United States, ²San Diego State University, Institute for Behavioral and Community Health, San Diego, United States, ³Kaiser Permanente, Washington, DC, United States, ⁴Albert Einstein College of Medicine, Department of Family and Social Medicine, Bronx, NY, United States

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Customer discovery is an entrepreneurial, iterative approach to inform the scale-up and broader dissemination of evidence-based interventions (EBIs) based on the needs and context of potential adopters or “customers.” Faith in Action is a faith-based EBI delivered by community health workers to increase physical activity among underserved churchgoing Latinas. This research applies customer discovery to gather perspectives from key customer groups—experts, partners, decision-makers, and funders—on potential determinants and opportunities for the dissemination and sustainability of Faith in Action.

Methods: We applied business modeling tools and conducted semi-structured interviews with 88 participants selected from four categories to identify cross-sector customer needs and inform sustainable dissemination strategies. Experts were defined as organizations with experience implementing similar programs; partners were entities capable of supporting program components; decision-makers were individuals responsible for making adoption decisions (e.g., church leaders); and funders were institutions with the capacity to provide financial resources. Thematic qualitative analyses were conducted iteratively by multiple coders to identify key themes related to adoption, implementation, and sustainment.

Results: Experts emphasized that sustainability requires early integration within churches, distributed leadership, ongoing investment in training and supporting community health workers, and trust-based partnerships. Partners highlighted the importance of flexible, community-driven programs that align with local needs and priorities, and integrate with existing infrastructure, leveraging resources within faith-based organizations to enhance recruitment and reach. Decision-makers noted that the program needed to prioritize engaging congregants and to include measurable impacts. Funders underscored the need for diverse, adaptable funding models (e.g., memberships, partnerships, fiscal sponsorships) and alignment with community benefit priorities to ensure long-term viability.

Conclusion: Customer discovery was a valuable process for identifying contextual factors that influence the adoption and scale-up of EBIs. Findings inform Faith in Action’s commercialization and sustainability strategies that align with partner and funder priorities, enhance adoption potential, and support continued access to the program. This methodological approach extends dissemination science by integrating business modeling principles to strengthen the long-term impact and reach of health behavior interventions.

SHORT ORALS

SO.3.30-09

From Consultation to Implementation: How Dijon Municipality Integrated Parents' and Children's Opinions into School Meal Planning

L. Marty¹, J. Dahmani¹, S. Nicklaus¹

¹INRAE, Center for Taste and Feeding Behaviour, Dijon, France

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Transitioning towards more plant-based diets is a key strategy to promote both human and planetary health. School canteens represent an important leverage point and the French EGalim law (2018) already made one vegetarian meal per week mandatory. In 2021–2022, Dijon municipality (France) engaged in a participatory process to evaluate the acceptability of increasing the frequency of vegetarian school meals beyond one per week by consulting both parents and children.

Methods: First, an online survey was sent to parents of children registered for school canteens ($n = 1,261$) to collect information on sociodemographic characteristics, dietary habits, and food choice motives. This study explored parents' willingness to increase the number of vegetarian meals served each week and the family characteristics associated with this willingness. Second, children's (from 6 to 11 years old) acceptance of vegetarian and non-vegetarian main dishes was assessed using connected scoring devices displaying a five-point smiley scale, installed in 38 primary school canteens across socially diverse neighborhoods. Over one school year (September 2021–June 2022), 208,985 ratings were collected for 125 main dishes (32 vegetarian, 93 non-vegetarian), allowing comparison of children's liking for vegetarian and non-vegetarian dishes.

Results: Among parents, 49% supported adding a second weekly vegetarian meal and 26% favored daily vegetarian options. Willingness was higher among highly educated, flexitarian or vegetarian parents, and those currently opting for pork-free meals (religious preference). Environmental, health, and animal welfare motives were positively associated with willingness, while sensory appeal and familiarity motives were negative predictors. Children's ratings revealed no difference in liking between vegetarian and non-vegetarian dishes. Interestingly, plant-based dishes tended to be more liked in schools located in lower socioeconomic areas, suggesting that increased vegetarian offerings may contribute to closing social dietary inequalities.

Conclusion: Integrating both parental preferences and children's feedback provided a comprehensive understanding of acceptability toward vegetarian school meals. Based on these findings, the Dijon municipality decided to increase the frequency of vegetarian school meals from one to two per week starting in 2023. This participatory approach illustrates how evidence-based local policy can facilitate a socially acceptable and sustainable food transition within public catering systems.

SO.3.30-10

Implementing Lifestyle Front Offices in a Hospital Setting

N.E.M.H. Colen¹, A. Vroomen², M. Crone¹, H.M.J. Werner³, D. de Ruijter¹

¹Maastricht University, Health Promotion, Maastricht, Netherlands, ²MUMC+, Prevention & Vitality, Maastricht, Netherlands, ³University of Oslo, Oslo, Norway

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: A new innovation to help patients (with non-communicable disease) with improving their lifestyle are Lifestyle Front Offices (LFOs). Patients are referred to these hospital-based innovations by their healthcare professional and receive help with finding an appropriate community-based intervention, such as a dietitian or physical activity support. The current study aimed to identify barriers and facilitators for the implementation of LFOs in hospitals through a process evaluation, using the Consolidated Framework for Implementation Research (CFIR).

Methods: A mixed methods (case) study was carried out on a LFO in the Netherlands. Quantitative data included patient demographics (gender, age) and data on the process (number of referrals, intakes, intervention starts) which were analyzed in SPSS through frequency analyses. Qualitatively, semi structured interviews and phone calls with

SHORT ORALS

fieldnotes were used, including three stakeholder groups (patients (N=15), healthcare professionals (N=8) and lifestyle health coordinators (N=3)). The interviews and coding guide were based on the CFIR and analyzed based on thematic analysis.

Results: In 20 months, 360 patients were referred to the LFO (47% male, 53% female; mean age of 68). Of these patients, 68% came to all appointments and started an intervention (of which 28% dietary interventions and 21% physical activity interventions).

Facilitating factors included good mission alignment of the LFO with the hospital, the societal relevance of lifestyle, and high need fulfillment for healthcare professionals, which all aided in generating support, easing the implementation process of the LFO.

Barriers to implementation were mainly found on patient level. Patients were not included in the development of the LFO, causing mixed need fulfillment in this group. Furthermore, patients with a lower socio-economic status faced many barriers regarding access to the LFO, because of a lack of information around appointment possibilities and monetary contributions.

Conclusion: The knowledge on barriers and facilitators for LFOs can help improving implementation and accessibility of the LFO, which then can aid in a higher uptake of lifestyle interventions by patients. An effect evaluation of the impact of these interventions on patient behavior and health, e.g. measuring diet quality or physical activity level, is a valuable suggestion for further research.

SO.3.30-11

Engaging Fathers and their 5-11y Old Children in Health Promotion: Effectiveness and Process Evaluation of the “Healthy Dads, Healthy Kids” Randomised Controlled Trial in Germany

M. Brandes¹, D. Schönbach², H. Busse¹, C. Buck¹, P.J Morgan³, L.M Ashton³, A.T Rayward⁴, T. Brand¹

¹Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, ²Hannover Medical School, Department of Rehabilitation and Sports Medicine, Hannover, Germany, ³University of Newcastle, School of Education, Centre for Active Living and Learning, Newcastle, Australia, ⁴University of Newcastle, School of Medicine and Public Health, Newcastle, Australia

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The prevalence of overweight and obesity in fathers from Germany is high, whilst their participation in health promotion programmes is low. We adapted the Australian, evidence-based healthy lifestyle programme “Healthy Dads, Healthy Kids”, targeting father-child tandems. We evaluated the effectiveness of the German programme using a randomised controlled trial with embedded process evaluation.

Methods: A two-arm randomised waitlist-controlled trial was conducted in 2023/2024 in Northern Germany. Trained facilitators delivered the intervention “Starke Väter, starke Kinder” (i.e., one dads-only session, eight father-child sessions, and handbooks with homework activities). Each tandem-session contained a 30-minute theoretical part (about physical activity, nutrition, media use and parenting), followed by 60 minutes of activities focussed on rough-and-tumble play, fundamental movement skills, and fitness. The primary outcome was fathers’ weight. Secondary outcomes included physical fitness (VO₂max; shuttle-run test) and physical activity (MVPA per week; accelerometry) for fathers and children. The process evaluation included participation quota, logbooks, focus groups with fathers and children, a post-intervention questionnaire, and semi-structured partner interviews.

Results: Overall, N=109 fathers (mean age: 44.2 years, mean BMI: 29.9 kg/m², high social status: 53.3%) and their children (mean age: 7.8 years, 46.7% girls) participated. N=34 father-child tandems were lost before follow-up. Fathers with very low activity and high BMI were more likely to drop out. Focus groups were conducted with n=38 fathers and n=37 children, supplemented by n=4 partner interviews. On average, fathers reduced their weight by 1.53 kg (p<.05) compared to the control group. No significant intervention effects were found on VO₂max and MVPA. While sessions were implemented as intended, the homework activities were only partially completed. The intervention dose received was 60%. Most families wanted the programme to be continued. Changes in lifestyle of families more broadly were reported. Programme alterations were suggested relating to the theoretical part, handbooks, and social interactions between families beyond the programme.

Conclusion: The German programme proved acceptable and was overall implemented as intended. Fathers weight loss was clinically meaningful. However, a need for programme modifications remains before considering a

SHORT ORALS

nationwide roll-out, in particular modifications to the theoretical part (reductions and linguistic simplifications) and the commitment of the homework activities.

SO.3.30-12

Strengthening a National Network for Nutrition Policy Implementation in ECEC: Findings from an EPIS-Guided Needs Assessment

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The National Nutrition Network – Early Childhood Education and Care (ECEC) is an Australian community of practice uniting practice, policy and research to co-create positive and sustainable ECEC food environments that strengthen children's health and learning. This study identified barriers, facilitators, and priorities to strengthen the Network's ability to support policy implementation. Guided by the Exploration, Preparation, Implementation, Sustainment (EPIS) framework, we generated strategies to advance equitable, sustained policy translation across systems.

Methods: A multi-method design captured breadth and depth of perspectives across policy, research, and practice sectors. Data were collected from June-September 2025 via network members: online survey (n = 21); semi-structured interviews (n=2 policymakers, n=2 researchers, n=2 practitioners); leadership SWOT (Strengths, Weaknesses, Opportunities, Threats) analysis (n = 7); two-day Community-Engaged Dissemination and Implementation (CEDI) workshop (n = 16). Survey items assessed engagement, confidence, and perceived barriers to implementation. Qualitative data analysis used rapid EPIS-aligned coding template to identify barriers, facilitators, and implementation strategies. Triangulation across sources and member checking with leadership enhanced credibility.

Results: Participants described a deeply relational network grounded in trust and shared purpose. These qualities facilitated Exploration phase, fostering collaboration and community legitimacy. These qualities served as facilitators in the Exploration phase by fostering collaboration and community legitimacy. However, accountability for nutrition policy was diffuse between health and education portfolios, which limited political will and coordination. During Preparation, participants emphasized co-design and valuing practitioner perspectives as mechanisms for readiness; fragmented training, short-term funding, and consultation-fatigue were barriers. In the Implementation phase, adaptive and relationship-driven strategies (e.g., coaching, storytelling) effectively tailored efforts to local contexts. High workforce turnover, competing demands, and perceptions of external oversight rather than partnership constrained consistent delivery. Sustainment depended on stable policy mandates, continuous funding, and mechanisms to capture practice-based evidence. Shifting political priorities, commercialization of the sector, and staff-turnover hindered long-term impact. SWOT also identified opportunities to improve communication, clarify roles, and develop practical implementation tools.

Conclusion: Applying EPIS revealed phase-specific priorities including enhancing training systems, workforce stability, and cross-sector communication to strengthen capacity for sustained and scalable policy impact.

SHORT ORALS

SO.3.30 Implementation and scalability: Strengthening Systems: Organisational Strategies for Scaling Nutrition and Activity Interventions

Room 5, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Most pregnant individuals in the U.S. do not meet physical activity (PA) guidelines. The *Expecting* clinical trial demonstrated that a supervised training program improved fitness and activity among pregnant individuals with obesity. This study describes (1) key outcomes from the clinical trial, (2) the adaptation of the intervention for community delivery using the Replicating Effective Programs (REP) framework, and (3) preliminary outcomes from a pilot community-based trial.

Methods: In *Expecting*, participants ($n=264$; $\text{BMI} \geq 30 \text{ kg/m}^2$) were randomized to exercise (EX) or standard of care (SOC) from 12 weeks of gestation until delivery. Compliance and step counts were measured. Using REP, the intervention was adapted for delivery in community settings. Adaptation steps included pre-testing virtual ($n=3$) and hybrid ($n=5$) delivery models, gathering stakeholder input ($n=11$ community partners), modifying intervention materials, data collection systems, and designing implementation strategies. A pilot randomized community trial was then implemented ($n=26$; 19 EX, 7 SOC). Participants were offered twice-weekly live exercise sessions. Compliance was the percentage of sessions completed, and fidelity was monitored monthly by research staff.

Results: In the clinical trial, median compliance was 61.7%. Daily steps showed a significant time $\times$ group interaction ($p=0.039$); higher-attendance participants took $\sim 1,100$ more steps/day vs. SOC. The EX group reduced their steps less (-592.9) than SOC (-889.8) as pregnancy progressed. During adaptation, EX participants preferred live sessions over recorded workouts (87% of sessions completed live), and community partners emphasized accountability, data collection simplification, and social support. In the community pilot, median compliance was 53.4%; EX participants were more compliant (57%) than SOC participants (25%) with providing step counts at 2+ of the requested time points. Among EX participants, 55% increased their average step counts from 12 to 36 weeks ($+229$ to $+4,929$ steps). Fidelity of the community-based trainers to the exercise protocol was $>95\%$. Qualitative feedback indicated the program was acceptable, achievable in pregnancy, and valued for its structure and support.

Conclusion: The *Expecting* intervention promoted physical fitness in a clinical trial and was feasibly adapted for community delivery using REP. Pilot data show moderate compliance, high fidelity, and meaningful step gains supporting the program's promise for scalable community implementation.

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: While several instruments have been developed to assess physical literacy, few consider its application in outdoor and nature-based contexts. Nature-based physical activities involve distinct challenges and affordances compared to build environments. Emerging evidence suggests that interaction with natural settings enhances prosocial behaviour, environmental awareness, and overall wellbeing (Bopp et al., 2022; Edwards et al., 2017; Young et al., 2020). This study aimed to develop and validate a context-specific nature-based physical literacy scale (NBPLS) to assess individuals' perception for lifelong engagement in nature-based physical activity.

Methods: A modified Delphi technique was employed to develop the initial item pool. A panel of 25 experts in physical literacy, physical education, and outdoor education participated across three iterative rounds and provided both quantitative ratings and qualitative feedback on item clarity, relevance, and domain alignment. Based on expert consensus, a 32-item preliminary scale was constructed. The scale was then administered to two independent samples of university students. Exploratory factor analysis (EFA) was conducted ($n=399$) to examine the underlying factor structure. Confirmatory factor analysis (CFA) was conducted ($n=401$) to validate the emergent model.

Results: The modified Delphi process yielded high levels of agreement and support the content validity of the scale. EFA identified five factors of motivation, confidence, physical competence, knowledge and understanding, and environmental interaction, which account for 58.31% of the total variance. Factor loadings exceeded .60 for most

SHORT ORALS

items. Internal consistency for each domain was acceptable ($\alpha = .73-.85$), and overall reliability of the scale was excellent ($\alpha = .91$). CFA supported the five-factor model, indicating acceptable model fit indices ($\chi^2(314)=844.60$, $\chi^2/df=2.69$, CFI=.88, GFI=.86, AGFI=.83, NFI=.87, RMSEA=.06, and SRMR=.06).

Conclusion: The NBPLS provides a psychometrically robust tool for assessing physical literacy in nature-based settings. Its application can guide the development of interventions that promote physical activity, environmental stewardship, and holistic wellbeing. The scale bridges a critical gap in physical literacy research and offers practical utility for educators, health professionals, and community organisations seeking to foster lifelong engagement with nature through movement.

SO.3.31-02

Healthy Lifestyle and Increased Happiness among Adolescents in Castilla-La Mancha

E. Martín-Moraleda¹, I. Pinilla-Quintana², C. Romero-Blanco³, A. Dorado², V. García-Coll², E. Cabanillas-Cruz², S. Aznar-Laín²

¹Francisco de Vitoria University, Madrid, Spain, ²University of Castilla-La Mancha, PAFS Group, Toledo, Spain, ³University of Castilla-La Mancha, PAFS Group Ciudad Real, Ciudad Real, Spain

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Given the growing importance of mental health among adolescents, it is essential to investigate strategies that contribute to their well-being. In this context, adopting a healthier lifestyle is increasingly recognized as a significant pathway to achieving a happier life in this population. Therefore, the aim of this study was to examine which healthy lifestyle factors are involved in increasing happiness among adolescents in Castilla-La Mancha.

Methods: The sample consisted of 462 third-year secondary school students (3^o ESO) from the five provinces of Castilla-La Mancha (Toledo, Ciudad Real, Albacete, Cuenca, and Guadalajara). Participants completed an ad-hoc questionnaire addressing sociodemographic and psychosocial variables (the “feeling worried, sad, or unhappy” dimension of the Euroqol-5D quality of life questionnaire) and lifestyle factors (including the 24-Hour Movement Guidelines, adherence to the Mediterranean diet, and breakfast habits). Descriptive tests, chi-square tests, and binary logistic regression adjusted for sex, age, socioeconomic status, environment, marital status, adherence to the Mediterranean diet, and breakfast consumption were used for statistical analysis.

Results: Findings show that 35.1% of the adolescent sample reported feeling worried, sad, or unhappy, of which 71.3% were girls ($p < 0.001$). Factors significantly associated with greater perceived happiness among adolescents included higher compliance with the 24-Hour Movement Guidelines ($p = 0.028$), particularly meeting physical activity recommendations ($p = 0.005$) and not skipping breakfast ($p = 0.005$). Logistic regression results indicate that meeting all recommendations of the 24-Hour Movement Guidelines predicts greater happiness in adolescents (OR = 0.365, 95% CI 0.136–0.982, $p = 0.045$).

Conclusion: Greater adherence to the 24-Hour Movement Guidelines, especially regarding physical activity, as well as not skipping breakfast, is associated with increased happiness in a sample of adolescents from Castilla-La Mancha. Furthermore, it is particularly relevant to apply these strategies among girls, as they exhibit lower levels of happiness at these ages.

SO.3.31-03

The Development and Feasibility of a Comprehensive Measurement Instrument for Parental Well-being, a Qualitative Analysis

I. Stamhuis - van de Kolk¹, P. Speetjens², S. Gerards², M. Crone²

¹Open Universiteit, Health Psychology, Heerlen, Netherlands, ²Maastricht University, Health Promotion, Maastricht, Netherlands

SHORT ORALS

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Parents play a pivotal role in the promotion of healthy nutrition and physical activity in the home environment. Factors related to parental mental health, like stress or depressive symptoms have been subject of research in healthy parenting. However, mental health is more than the absence of mental disorders and mental well-being may play an important role in parenting. Parental well-being appears to be a complex construct in need for a multidimensional operationalisation. The Dutch Youth Institute developed a comprehensive framework on parental well-being. The goal of the current research was to develop a measurement instrument based on this comprehensive framework and test its feasibility.

Methods: A first version of the questionnaire was developed from an item bank of existing questionnaires measuring aspects of parental well-being. This version was pretested among a convenience sample of parents of children aged 0-18-years using cognitive interviews with a thinking aloud method. Based on this pretest, a second version of the questionnaire was developed. Adaptations were made on formulation of items to increase understandability, the answering scale, and development of new items. As part of a larger validation study, an open-ended question on the questionnaire was analysed on feasibility aspects.

Results: Six parents participated in the cognitive interviews and N=379 replied on the open-ended question. In general, the questionnaire was received well by the parents. Parents sometimes perceived the formulation of the questions as difficult. They were inclined to choose the middle category of the answering scale (5-point scale, never – always) and the answering scale did not always match the question well. Answering was complicated in case of more children and parents perceived the age of the children as an important factor related to their well-being. The cognitive interviews strongly showed that parents became increasingly aware of their well-being due to the questionnaire: *“I will be still thinking about these questions later on”*.

Conclusion: This research showed that the questionnaire was received well by parents and identified some first issues regarding feasibility of the questionnaire. The questionnaire will be further developed and used to study the association between parental well-being and healthy parenting.

SO.3.31-04

The Effects of the Coronavirus Job Retention Scheme (Furlough) on Lifestyle Health-related Behaviours and Mental Health Symptoms in a Sample of UK-based Truck Drivers

M. Sayyah¹, N. Paine¹, A. Sherry², J. King¹, V. Varela-Mato¹, K. Ruettger³, A. Guest¹, D. Longman¹, C. Shaw⁴, S. Clemes¹

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: The COVID-19 pandemic triggered an unprecedented shutdown that reshaped work and daily life worldwide. In the UK, the Coronavirus Job Retention Scheme (furlough) supported over 8.7 million workers on temporary paid leave. This large-scale policy created a unique opportunity to examine how relief from occupational demands influenced lifestyle behaviours and wellbeing. For truck drivers, already vulnerable to poor sleep, prolonged sitting, and fatigue, the lockdown created two opposing realities: intensified workloads for drivers with essential deliveries versus complete work cessation for other drivers under furlough. This study examined whether furlough provided relief that enabled healthier behaviours and improved wellbeing or introduced new challenges for this high-risk group.

Methods: A COVID-19-specific online questionnaire was completed by truck drivers participating in the Structured Health Intervention For Truckers (SHIFT-UK) trial, a randomised controlled trial of a workplace health promotion programme. The survey captured sleep, nature visits, alcohol intake, sitting and standing time, occupational-fatigue and symptoms of anxiety and depression. Of 220 invited drivers, 91 (age: 51.3±9 years, 98.9% male) responded, with 44 (48%) reporting furlough. Longitudinal analyses also included follow-up data six months post-lockdown from the SHIFT trial.

SHORT ORALS

Results: During lockdown, furloughed drivers reported longer sleep (median 7.0 vs 6.5 h/night, $p < .001$), more nature visits (3 vs 2 times/week, $p < .01$), greater standing time (2 vs 1 h/day, $p < .05$), and higher engagement in new physical activity (36% vs 15%, $p < .05$) than non-furloughed drivers. Furloughed drivers experienced a temporary reduction in anxiety symptoms during lockdown ($p = .010$) and a rise in frequent nature visits (41% ≥ 4 days/week vs 7% pre-pandemic), but by 6-months follow-up, after returning to work, anxiety symptoms returned to baseline ($p = .263$), new activity declined ($p < .001$), and chronic fatigue increased ($p < .01$).

Conclusion: Furloughed drivers adopted healthier behaviours with short-term improvements in sleep, activity, and mental wellbeing, including reduced anxiety. These gains, likely reflecting temporary relief from work demands, diminished after returning to work, as chronic fatigue increased post-lockdown. This study provides rare insight into how an unprecedented national policy affected health in a high-risk occupational group, underscoring the need for sustained workplace interventions to maintain wellbeing beyond temporary disruptions.

SO.3.31-06

Portuguese Validation of the Psychological Insight Scale: Psychometric Properties and Associations with Behavioral Change Following Psychedelic Experiences

J. Encantado¹, M. Vilhena², L.C. Carvalho¹, P. J. Teixeira¹

¹Faculdade de Motricidade Humana, Universidade de Lisboa, Behavioral Regulation, Lisboa, Portugal, ²ISPA - Instituto Universitário, Lisboa, Portugal

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Recent decades have witnessed a resurgence of interest in psychedelic science. Teixeira et al. (2022) suggest that psychedelics may disrupt maladaptive patterns and facilitate health behavior change, contributing to the emerging concept of „behavioral psychedelics“ (Neuhaus and Slavich, 2022). To advance future research examining psychological factors as potential mechanisms facilitating behavioral change and promoting psychological well-being, validation and adaptation of psychometric instruments is essential. This study aimed to: i) translate and adapt the Psychological Insight Scale (PIS) to Portuguese language and culture, and ii) examine the psychometric properties (factorial validity, reliability, and construct validity) of the translated items.

Methods: Data were collected in ceremonial contexts via online questionnaires administered at multiple time points before and after ceremonies. Following the original authors procedures, Principal Component Analysis (PCA), internal consistency analysis, concurrent validity, and predictive validity analyses were conducted. Spearman correlations and linear regression models examined relationships between psychological insight, well-being, and behavioral change.

Results: PCA revealed a unifactorial structure with the principal component explaining 73.3% of total variance and demonstrating excellent internal consistency ($\alpha = 0.993$) across the six items. Concurrent validity analyses indicated that higher psychological insight was significantly associated with lower psychological resistance ($\rho = -.700$, $p < .001$). Predictive validity was evidenced by significant correlations between PIS-6 scores (one day post-ceremony) and psychological well-being at two-week follow-up (WEMWBS; $\rho = .156$, $p < .001$). A moderate positive correlation emerged between insight-influenced behavioral change (PIS-item 7) and well-being at follow-up ($\rho = .401$, $p < .001$). Regression analyses demonstrated that PIS-6 scores assessed one day post-ceremony marginally predicted subsequent well-being changes ($\beta = .219$, $F(1,78) = 3.919$, $p = .051$, $R^2 = .036$), while PIS-6 scores at two weeks significantly predicted well-being outcomes ($\beta = .252$, $F(1,78) = 5.30$, $p = .024$, $R^2 = .052$). Notably, insight-related behavioral change (PIS-item 7) assessed at two weeks strongly predicted well-being at follow-up ($\beta = .420$, $F(1,78) = 16.671$, $p < .001$, $R^2 = .166$).

Conclusion: The Portuguese version of the PIS demonstrates robust psychometric properties, including unifactorial structure, internal consistency, and adequate concurrent and predictive validity. The instrument proved sensitive in capturing the relationship between psychological insight, behavioral change, and well-being outcomes following psychedelic experiences in ceremonial contexts.

Device-measured Moderate-to-vigorous Physical Activity and Mental Health among University Students: Insights from the Health@NUS Cohort Study

X.H. Chua¹, S.Y.X. Tan¹, M. Chen¹, S.M. Edney¹, R.M van Dam^{1,2}, F. Müller-Riemenschneider^{1,3}

¹National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, ²The George Washington University, Departments of Exercise and Nutrition Sciences and Epidemiology, Milken Institute of Public Health, Washington DC, United States, ³Charité-Universitätsmedizin Berlin, Digital Health Center, Berlin Institute of Health, Berlin, Germany

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: University years represent a crucial window where students encounter diverse academic and social stressors. Engaging in moderate-to-vigorous physical activity (MVPA) is often associated with better mental health, however, existing studies have leveraged on self-reported MVPA, which is prone to inaccuracy and recall biases. In this study, we seek to examine how device-measured MVPA influences the mental health of university students.

Methods: Health@NUS is a two-year prospective cohort of university students in Singapore leveraging on Fitbit smartwatches to continuously collect physical activity and sleep data between October 2020 to January 2023. Mental health was assessed by the 21-item Depression, Anxiety, and Stress (DASS-21) in January 2023. Fitbit data were filtered to exclude days with <8h of daily wear time or atypical activity levels. Participants with at least 30 valid person-days of data and DASS-21 response were included. Differences in mental health across MVPA tertiles were examined using ANOVA with post hoc analyses adjusting for sex and year of study.

Results: Participants (N=421) were mostly female (57.7%) and of Chinese ethnicity (92.4%). Equal proportions were enrolled in years 1-2 (36.3%), year 3 (27.6%), and years 4-5 (36.1%). In total, 131,490 person-days were collected (mean 312.3±159.6 days/participant; average wear time of 16.9±3.6 hour/day). Mean daily MVPA was 15.3±5.5 min, 29.6±4.6 min, and 58.5±18.1 min for the low-, mid-, high-MVPA tertiles, respectively. After adjusting for sex and year of study, depression scores (p=0.42) and anxiety scores (p=0.17) did not differ across MVPA tertiles. Stress scores differed significantly (p=0.03), participants in higher MVPA tertiles had approximately 2 points higher adjusted stress scores than those in the lowest MVPA tertile.

Conclusion: Our findings highlight that higher device-measured MVPA levels was associated with greater perceived stress, but not with symptoms of depression or anxiety. This suggests that greater MVPA may coexist with increased perceived stress among university students, reflecting academic workload, time pressures, or stress-induced activity rather than the health promoting effects of PA.

SO.3.31-08

Do Physical Activity and Sedentary Behaviour Have an Effect on Burnout Risk in Flemish Secondary School Teachers? A Prospective Study

Y. Verhavert¹, E. Van Hoof², J. Van Cauwenberg³, J. de Vries⁴, P. Clarys¹, E. Zinzen¹, K. De Martelaer¹, T. Deliëns¹

¹Vrije Universiteit Brussel, Movement and Nutrition for Health and Performance, Brussels, Belgium, ²Vrije Universiteit Brussel, Brussels, Belgium, ³Université Libre de Bruxelles, Brussels, Belgium, ⁴Leiden University, Leiden, Netherlands

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Burnout in secondary school teachers is an increasing concern. More physical activity (PA) and less sedentary behaviour (SB) may be beneficial to reduce burnout risk in this population. However, no longitudinal evidence on the role of PA-intensities across PA-domains and the role of SB-domains exists. Furthermore, the teaching population, characterized by high PA levels, needs to be studied, as literature showed that leisure PA was less effective to reduce burnout risk in employees with physically demanding jobs. Therefore, this study aimed to examine the causal effects of different PA-intensities and -domains and SB-domains on burnout risk in secondary school teachers.

Methods: In this prospective study, 306 Flemish secondary school teachers participated in three measurement moments during the school year 2019-2020 (i.e., start and end of 1st semester, start of 2nd semester). Each measurement

SHORT ORALS

moment, burnout risk (including recovery need and the three burnout dimensions: emotional exhaustion, depersonalisation, personal accomplishment), PA-intensities (walking, moderate-intensity PA (MPA) and vigorous-intensity PA (VPA)) in five PA-domains (work, transport, leisure-time, domestic and garden), and SB in three domains (work, transport, leisure-time), as well as sociodemographic factors and work-related factors were assessed. Multiple linear mixed models including selected confounders based on directed acyclic graphs were applied in R.

Results: MPA during transport and SB at work were negatively associated with emotional exhaustion ($p=0.021$ and $p=0.003$, respectively). MPA at work was positively associated with personal accomplishment ($p=0.049$), whereas VPA at work was positively associated with recovery need ($p=0.041$). Gardening MPA was positively associated with emotional exhaustion ($p=0.010$), and both gardening and domestic MPA were positively associated with recovery need ($p=0.016$ and $p=0.018$, respectively). The (negative) association between leisure-time VPA and emotional exhaustion was borderline significant ($p=0.055$).

Conclusion: To reduce burn-out risk, our findings suggest teachers to engage in MPA at work and during transport, VPA during leisure-time, and SB at work, and to limit VPA at work as well as gardening and domestic MPA. Altogether, this study highlights the importance of differentiating between PA-intensities across PA-domains and between SB-domains when addressing burnout risk. Future research should measure additional potential confounding factors and employ longer time intervals.

SO.3.31-10

Exploring Food Insecurity, Diet Quality and Mental Wellbeing among Students at Queen's University Belfast

M.N. Yavuz¹, D. Logan¹, J. Woodside¹, B. Horgan², S. Furey³, C. Leung⁴, C. McEvoy¹

¹Queen's University Belfast, Centre for Public Health, Belfast, United Kingdom, ²Queen's University Belfast, Head of Campus Food and Drink at Queen's University Belfast, Belfast, United Kingdom, ³Ulster University, Hospitality Tourism and Events Management, Belfast, United Kingdom, ⁴Harvard T.H. Chan School of Public Health, Nutrition, Boston, United States

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Food insecurity, defined as limited access to sufficient nutritious food for a healthy and active life, is an important social determinant of health. University students constitute a vulnerable group concerning both food security and mental health. In the UK, 44% undergraduate students were classified as food insecure. This study aimed to investigate the associations between food security, diet quality, and mental wellbeing amongst Queen's University students (QUB).

Methods: A cross-sectional online survey was conducted among undergraduate and postgraduate students enrolled at QUB between November 2024 and July 2025. The 88-item survey covered demographics, food security, diet quality, general health, mental wellbeing, and academic success. Food security was evaluated using the 10-item U.S. Adult Food Security Survey Module (FSSM; cut-off score=3). Mental wellbeing was assessed using three different validated measures: Short Warwick-Edinburgh Mental Wellbeing Scale (SWEMWBS; 7–35, higher scores indicating greater wellbeing), the Patient Health Questionnaire-9 (PHQ-9; 0–27) and Generalized Anxiety Disorder-7 (GAD-7; 0–21), with higher PHQ-9 and GAD-7 scores indicating higher levels of depression and anxiety symptoms, respectively. Diet quality was assessed using a culturally adapted Mediterranean Diet Screener (0–13). Regression models examined associations between food security and mental wellbeing, depression, and anxiety adjusting for age, gender, and ethnicity.

Results: Data from 1084 students (78.0% female, 70.8% undergraduate, 81.2% white) aged 24.3 ± 7.2 years (range 18 to 63), were analysed. Approximately 42% were classified as food insecure, among whom 52.7% reported low mental wellbeing, 55.1% exhibited elevated depressive symptoms, and 64.7% experienced higher anxiety symptoms. Food insecurity was associated with a significant reduction in wellbeing scores ($B = -1.9$, 95% CI $-2.32, -1.42$). Food insecure students scored on average 1.9 points lower on the mental wellbeing score and were twice as likely to report depressive and anxiety symptoms compared to food secure students (OR 2.74, 95% CI 2.08–3.60 and OR 2.16, 95% CI 1.65–2.83, respectively). All findings are from fully adjusted models.

Conclusion: Our findings highlight food insecurity as a significant social determinant adversely affecting mental wellbeing and anxiety/depressive symptoms, suggesting that addressing food insecurity through tailored interventions could substantially improve mental health outcomes in the university student population.

SO.3.31-11

UK Truck Drivers' Musculoskeletal Discomfort and Associated Risk Factors

L. Wang¹, J. King¹, E. Petherick¹, S. Clemes¹

¹Loughborough University, Loughborough, United Kingdom

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Truck drivers are a sedentary occupational group, with high prevalences of physical inactivity, prolonged sitting and poor / disrupted sleep. Limited international research suggests that truck drivers experience high levels of work-related musculoskeletal (MSK) disorders; however, little evidence exists within UK truck drivers. This study examined MSK symptom prevalence in a UK truck driver cohort and explored associations between MSK risk, health behaviours, and markers of physical and mental health.

Methods: Baseline data from UK truck drivers collected as part of the UK-SHIFT RCT were used in this study. Measurements included a comprehensive health check, device-based measures of activity, sitting (activPAL) and sleep (GENEActiv), and self-reported measures of MSK symptoms and markers of mental wellbeing (including symptoms of anxiety and depression [Hospital Anxiety and Depression Scale], acute occupational fatigue, situational sleepiness [Karolinska Sleepiness Scale]). A descriptive analysis was conducted on the prevalence of pain and its sites. Spearman's correlation analysis evaluated the relationship between overall MSK pain and potential risk factors. Binary logistic regression was subsequently performed to assess associations between risk factors and overall MSK pain.

Results: Out of 385 drivers (99% male, median age=49 years, BMI=29.8 kg/m²), 84.7% reported experiencing MSK pain, mainly in the lower back (55.3%), knee (46.0%), shoulder (40.5%), and neck (37.9%). There were no associations between device-measured physical activity, sitting time, sleep duration or BMI and MSK pain/discomfort. After controlling for covariates (BMI, waist, hip and neck circumferences, age, sex, working duration, sleep duration, sitting time, physical activity), associations between anxiety symptoms, acute occupational fatigue, situational sleepiness, age and MSK risk were observed. The highest odds ratio was observed for anxiety symptoms, with those having borderline or abnormal scores being 4.4 times more likely to report MSK pain than those with healthy scores (95% CI [1.551,12.57] p=0.005).

Conclusion: Truck drivers show a high prevalence of MSK pain, driven by an ageing workforce and occupational factors that promote anxiety, fatigue, and situational sleepiness. In this sample, poor mental health had a stronger association with MSK pain than physical behaviours like sitting or activity.

SO.3.31-13

Social Media Use and Mental Distress: Is the Association Different by Age?

O. Amaral de Andrade Leao¹, P.G. Machado², O.I. Ayoola¹, A. Patel¹

¹University of Illinois Urbana-Champaign, Health and Kinesiology, Champaign, United States, ²Federal University of Lavras, Graduate Program in Veterinary Sciences, Lavras, Brazil

SO.3.31 Mental Health and Wellbeing: The Ecology of Wellbeing: Promoting Mental Health in Education, Work, and Nature

Room 6, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Considering the increase in social media usage time by the population, some studies have been warning about its effects on mental health. This issue may be even more pronounced when considering the population at different ages, given their varying social media use. Thus, the objective of this study was to test the association between social media frequency of use and mental distress and see if this association is different by age groups.

Methods: The study used data from the Health Information National Trends Survey (HINTS) 6 project, based on a United States of America representative adult sample (N=6252). Mental distress was evaluated using the Patient Health Questionnaire-4 (PHQ-4) tool, with scores higher than or equal to three considered as having some mental distress. Social media frequency of use was measured through a survey and categorized as 'Never', 'Low Frequency of Use', and 'High Frequency of Use'. Association between social media and mental distress was tested using multivariable logistic regression, adjusted for sex, ethnicity, age, education, marital status, and isolation level, and stratified by different

SHORT ORALS

age categories (18-29, 30-39, 40-49, 50-59, 60-69, 70+ years).

Results: Overall, 53.05% of the sample reported a high frequency of social media usage, and 34.62% were classified as having some mental distress. Compared to individuals who never used social media, individuals with low (OR=1.33, 95%CI=1.11-1.59) and high (OR=1.78, 95%CI=1.52-2.09) frequency of use presented higher odds of mental distress. When stratifying by age, only individuals with 18 to 29 years presented higher odds of mental distress for low (OR=13.96, 95%CI=1.47-49.42) and high (OR=8.52, 95%CI=2.18-89.13), when compared to those who never used. For the other age groups, no marked and significant associations were observed.

Conclusion: Frequent social media use has been associated with mental distress, especially among young individuals. This result highlights the need for more initiatives to improve the healthy use of social media targeting young adults.

SO.3.32-01

Which Factors Influence Urban Indian Adolescents' Snacking Behaviors? A Qualitative Study

N. Rath¹, A. Worsley², M. Bruening³

¹Ahmedabad University, Bagchi School of Public Health, Ahmedabad, India, ²Deakin University, School of Exercise and Nutrition Sciences, Geelong, Australia, ³Pennsylvania State University, Department of Nutritional Sciences, College of Health and Human Development, University Park, United States

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Urban Indian adolescents often practice unhealthy dietary behaviors such as meal skipping and snacking on energy-dense, nutrient-poor (EDNP) foods. Excessive consumption of EDNP snacks is widely cited as one of the potential drivers of the obesity epidemic. To facilitate healthy snacking among adolescents it is important to explore the various factors which may influence the consumption of healthy and unhealthy snacks among Indian adolescents. The aim of this inquiry was to qualitatively explore factors influencing snacking behavior of urban Indian adolescents.

Methods: Underpinned by the social constructivism paradigm, an exploratory-descriptive qualitative research approach was used to obtain an in-depth understanding of the influences on adolescents' snacking behaviors. Purposive sampling was employed to recruit adolescents aged 10-19 years from two government and two private schools in Varanasi, Uttar Pradesh, India. Face-to-face interviews were conducted in Hindi/English, per the preference of the interviewees. The interviews were audio recorded, transcribed verbatim, and translated to English (where necessary) for data analysis. The transcribed data were subjected to thematic analysis. Themes were extracted using inductive coding in the NVivo software program.

Results: A total of 62 adolescents (50% male; 76% private school students) with mean age 15.3 (SD : 1.86) years completed the interviews. Ten themes emerged including:

- (i) Perceptions of a snack;
- (ii) Liking for unhealthy snacks;
- (iii) Cost of snacks;
- (iv) Family food environment (e.g. Food rules regarding snacking);
- (v) Influence of the peer group;
- (vi) School food environment (e.g. Easy availability of unhealthy snacks in canteens, limited supply of healthy snacks in canteens);
- (vii) Snacking episodes (e.g. consuming snacks at night, consuming snacks while watching TV);
- (viii) Influence of mass media;
- (ix) Packaging;
- (x) Neighborhood food environment.

Conclusion: The emerging themes demonstrate that multiple factors are likely to influence snacking behaviors in Indian adolescents, aligning with existing scholarship on adolescent snack consumption. Behavioral nutrition interventions should be developed to create enabling environments to promote healthy snack consumption in adolescents by eliminating barriers at the individual, household, and community levels.

Validity, Reliability, Feasibility and Safety of Field-based Physical Fitness Test for Individuals with Intellectual and Developmental Disability: A Systematic Review

C. Cruz-León^{1,2}, N. Marín-Jiménez^{1,2,3}, G. R. Oviedo⁴, M. Guerra-Balic⁵, M. Cuenca-Garcia^{1,2}, J. Castro-Piñero^{1,2}, R. Izquierdo-Gómez^{1,2}, GALENO Research Group

¹University of Cadiz, Physical Education, Cadiz, Spain, ²Instituto de Investigación e Innovación Biomédica de Cádiz (INiBICA), Cadiz, Spain, ³University of Almeria, Health Research Centre, Department of Education, Almeria, Spain, ⁴Mississippi State University, Department of Kinesiology, Mississippi, United States, ⁵Ramon Llull University, FPCEE-Blanquerna, Barcelona, Spain

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Individuals with intellectual and developmental disability (IDD) often present lower levels of physical fitness, high levels of sedentary behaviour, and increased risk of chronic diseases compared with general population. Researchers, clinicians, and sport professionals still lack clear evidence on which field-based fitness tests are valid, reliable, feasible, and safe for this population. This systematic review is the first to synthesize several psychometric evidence of field-based fitness tests in individuals with IDD.

Methods: A systematic search was conducted in MEDLINE (PubMed), Web of Science, Scopus, and SPORTDiscus up to February 4, 2025, following PRISMA guidelines. Methodological quality was rated as high, low or very-low using standardized checklist. Three evidence levels (strong, moderate and limited) were established based on the quantity and consistency of studies, and according to the global evidence for validity, reliability, feasibility and safety.

Results: Of 1,722 records identified, 43 original studies were considered eligible, of which 24 (9 of high quality) examined validity, 34 (19 of high quality) reliability, 21 (2 of high quality) feasibility, and 16 (5 of high quality) safety of field-based fitness tests. Fourteen studies included participants with DS, 15 only IDD, and 14 included mixed-samples. Strong evidence indicated that: a) the 20-m shuttle run test shows lack of consensus on its validity in children and adolescents; b) the 6-min walk, and the handgrip strength tests shows high reliability in adults; and c) the standing long jump test shows high reliability in children and adolescents. Moderate evidence indicated that the 6-min walk test was safe in adolescents and young-adults. No strong evidence was found for feasibility and safety, mainly due to a few studies. Overall, when examining the global evidence for validity, reliability, feasibility, and safety (all ages included), all field-based fitness tests showed limited evidence.

Conclusion: Is the first review that synthesis several psychometric evidence for field-based fitness tests in individuals with IDD. Not all tests have been evaluated across different age groups, and some intellectual disability's levels remain underrepresented. More high-quality studies are needed to establish standardized, evidence-based assessment protocols that improve monitoring, exercise prescription, and promote participation in physical activities among individuals with IDD.

SO.3.32-04

The Acute Effects of Interrupting Prolonged Sitting with Regular Activity Breaks on Postprandial Glucose and Insulin in Adults: A Systematic Review and Meta-analysis

J. Gale^{1,2}, H. Martin¹, J. Haszard³, M. Peddie¹

¹University of Otago, Human Nutrition, Dunedin, New Zealand, ²Auckland University of Technology, School of Sport, Exercise and Health, Auckland, New Zealand, ³Haszard Biostatistics, Auckland, New Zealand

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Experimental studies indicate that frequently interrupting sitting with acute bouts of physical activity tend to reduce postprandial glucose and insulin responses, although questions remain about the consistency of this effect

SHORT ORALS

across different modes and patterns of activity. The purpose of this study was to conduct a comprehensive systematic review and meta-analysis of intervention studies investigating the effect of regular activity breaks on postprandial glucose and insulin responses in adults.

Methods: Acute (<24 h duration) laboratory-based randomised crossover trials, which compared postprandial glucose, and/or insulin response between prolonged sitting and any intervention involving interrupting sitting with repeated (at least three times) short (<10 min) bouts of activity, were identified across five databases up until 9th October 2024. Risk of bias was assessed using the Downs and Black quality assessment tool. For each outcome, study effect sizes were standardised and a random-effects meta-analysis undertaken. To account for multiple results from a single study, multilevel meta-analyses were carried out with study as a random effect. Subgroup meta-analyses were undertaken for mode and frequency of activity breaks.

Results: A total of 53 studies met inclusion criteria, of which 39 were included in the meta-analysis. Overall, when compared with prolonged sitting, regular activity breaks lowered postprandial glucose incremental area under the curve (iAUC) (SMD -0.30, 9% CI -0.43 to -0.13) and insulin iAUC (SMD -0.30 95% CI -0.46 to -0.14). Walking activity breaks produced the largest reductions in postprandial glucose iAUC (SMD -0.33, 95% CI -0.48 to -0.17) and insulin iAUC (SMD -0.44, 95% CI -0.62 to -0.27), compared to the other modes of activity. Interrupting sitting more frequently (every 15-20 min) produced the largest reductions in postprandial glucose iAUC (SMD -0.51, 95% CI -0.83 to -0.19) and insulin iAUC (SMD -0.41, 95% CI -0.77 to -0.06).

Conclusion: Frequently interrupting prolonged sitting by performing short activity breaks can improve acute postprandial glucose and insulin response in adults, with the largest reductions occurring when walking activity breaks are performed every 20 min or less.

SO.3.32-05

Co-designing a Climate-resilient Healthy Active Living Intervention for Youth as Agents of Change: Lessons Learned across Contexts and Geographies

S. Kandasamy¹, M. Kwan², R. de Souza³, D. Sherifali⁴, S. Anderson⁵, R. Stennett¹, D. Desai⁶, S. Anand¹, J. Smith⁷, T. Edwards⁸

¹McMaster University, Medicine, Hamilton, Canada, ²Brock University, Child and Youth Studies, St. Catherine's, Canada,

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: This presentation shares lessons from an international collaboration between research teams in Canada and Jamaica to co-design a healthy active living intervention with youth, youth leaders, and service providers. The project aimed to engage young people as agents of change in promoting sustainable, health-enhancing behaviors across diverse contexts. We describe the overarching goals of the research program, the participatory approach used to engage communities, and the resulting intervention that will be pilot-tested in low-income neighborhoods within a high-income nation (Hamilton and Calgary, Canada) and a low-to-middle income nation (Jamaica).

Methods: Noncommunicable diseases (NCDs) account for 70–90% of deaths in both Canada and Caribbean nations, with prevalence rising globally and further threatened by climate change. Major NCDs, including cardiovascular disease, type 2 diabetes, and certain cancers, share modifiable risk factors such as poor diet, physical inactivity, and obesity. Early-life prevention through sustainable diets, physical activity, and mental well-being offers the most cost-effective pathway to reduce these risks. This project leverages an experience-based co-design approach to empower youth as citizen scientists, fostering local solutions for healthy active living that are both contextually relevant and climate-resilient.

Methods: Using a Community-Based Participatory Action framework, we conducted community engagement workshops, key informant interviews, community ecosystem mapping, and co-design sessions with youth and service providers. These activities were implemented across neighborhoods in Calgary and Hamilton (Canada) and in three Jamaican communities to inform the development of a shared intervention model with locally tailored adaptations.

Results: The resulting intervention is an intergenerational, climate-resilient healthy active living program emphasizing local and sustainable food production and preparation and home economics skills, after-school physical

SHORT ORALS

activity, social connection, and fostering a sense of belonging. Core program components were co-developed with communities, while contextual adaptations ensure cultural and environmental relevance across all sites.

Conclusion: This project demonstrates the potential of co-design to empower youth as catalysts for community-based health and wellness. By centering youth voices and lived experiences, the intervention fosters ownership, climate action, and meaningful cross-geographical learning, laying the groundwork for scalable, equity-driven approaches to healthy active living.

Association between Cardiovascular Health and Mental Health in Apparently Healthy Adults: The Mediating Role of Physical Fitness. CARDIOFIT Study

Á. Ibáñez-Gálvez¹, C. Cruz-Leon¹, A. Pérez-Bey¹, S. Sánchez-Parente¹, J. Cies-Valleras¹, J. Castro-Piñero¹, R. Izquierdo-Gómez¹, M. Cuenca-García¹

¹Universidad de Cádiz, GALENO Research Group, Department of Physical Education, Faculty of Education Sciences. Instituto de Investigación e Innovación Biomédica de Cádiz (INIBICA), Cádiz, Spain, Puerto Real, Spain

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Cardiovascular diseases burden make monitoring cardiovascular health (CVH) essential. The Life's Essential 8 (LE8) assesses CVH across behavioral and biological domains. Mental health disorder, are leading causes of adult disability. Recent evidence suggests better CVH may protect against poor mental health, while physical fitness (PF), a powerful indicator of both cardiovascular and mental health, may modify this association. This study examined (i) the association between CVH and mental health (anxiety, depression) and (ii) the role of PF in this relationship.

Methods: This cross-sectional study included 354 apparently healthy adults (42.37±12.57 years). Anxiety and depressive symptoms were self-reported using the *State-Trait Anxiety Inventory* and the *Center for Epidemiologic Studies Depression Scale* questionnaires. PF was assessed by a graded-exercise test for cardiorespiratory fitness and the handgrip strength test for muscular strength. CVH was evaluated using LE8 score (0-100), combining behavioral (diet, physical activity, nicotine exposure, sleep) and biological (non-HDL cholesterol, blood glucose, blood pressure, body mass index) components. Two multiple linear regression models were fitted: (1) included LE8 as the independent variable and adjusted for age, sex and education; (2) further adjusted for cardiorespiratory fitness and handgrip strength. Analyses were also stratified by sex and age group (18-34, 34-40, 50-64 years). Statistical significance was set at $p < 0.05$.

Results: Mean scores were 15.56 ± 10.41 and 26.72 ± 3.47 for state and trait anxiety, 10.13 ± 3.58 for depressive symptoms, and 76.2 ± 10.82 for LE8. There were no significant association between LE8 and anxiety ($p > 0.05$). LE8 showed a negative tendency with depressive symptoms ($\beta = -0.103$, $p = 0.078$), although this tendency disappears when adjusting for PF. However, separated by age group, LE8 showed a negative tendency with depressive symptoms only in the 50-64 year group ($\beta = -1.79$, $p = 0.07$), but this association disappeared after adjusting for PF. All models were non-significant by sex ($p > 0.05$).

Conclusion: Higher LE8 scores tended to associate with lower depressive symptoms, but this relationship was attenuated after adjusting for PF. This suggests PF may partly mediate the link between cardiovascular and mental health, underscoring the value of promoting both CVH and PF to help prevent depressive symptoms in adulthood.

SO.3.32-07

Can 24-h Activity Intensities and Domains, Body Composition, and Diet Macronutrients Compositions Reveal a Diagnosis of Gestational Diabetes?

M.A. Oviedo-Caro¹, J. Bueno-Antequera², D. Munguía-Izquierdo²

¹University of Seville, Department of Physical Education and Sport, Seville, Spain, ²University Pablo de Olavide, Seville, Spain

SHORT ORALS

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: This observational study aims to examine differences in 24-hour activity patterns (intensities and domains), dietary macronutrient intake, and body composition between women with and without a diagnosis of gestational diabetes mellitus (GDM), with the goal of identifying behavioral and physiological characteristics associated with GDM that may support its early detection and enhance management approaches.

Methods: Pregnant women (n=88) were classified as either diagnosed with GDM or non-diagnosed at approximately the 24th week of gestation. The 24-hours activity behaviours were assessed using an accelerometer to quantify activity intensities and the Pregnancy Physical Activity Questionnaire to quantify time spent in activity domains. Body composition was measured using a bioelectrical impedance device, and dietary macronutrient intake was assessed by a Food Frequency Questionnaire. The composition of activity intensities was derived from the time spent in sleep, sedentary behavior (SB), light physical activity (LPA), and moderate-to-vigorous physical activity (MVPA). The composition of activity domains was determined from the time allocated to household/caregiving, occupational, leisure, commuting, and inactive activities. Body composition was characterized by the relative percentages of fat, muscle, and bone mass, while dietary composition was expressed as the proportional intake of macronutrients, including saturated fat, unsaturated fat, protein, and carbohydrates. Isometric log-ratio (ilr) coordinates were compared between diagnosed and non-diagnosed women using Hotelling's T^2 test. Binomial logistic regression was employed to examine associations between ilr coordinates and GDM diagnosis.

Results: Significant differences were observed in activity intensity ($p=0.048$), activity domain ($p=0.041$) and body ($p=0.005$) compositions between pregnant women diagnosed with GDM and those without a diagnosis, while no significant differences were found in dietary composition. Binomial logistic regression showed significant associations between the diagnosis of GDM and the ilr.3 coordinate of activity intensity ($p = 0.046$), the ilr.3 coordinate of activity domain ($p = 0.047$), and the ilr.2 coordinate of body composition ($p = 0.031$).

Conclusion: Significant differences in activity patterns and body composition, but not dietary intake, were observed between women with and without GDM. Associations between activity behaviors and body compositions with GDM diagnosis suggest that these factors may serve as relevant indicators for the early detection and targeted management of GDM.

SO.3.32-08

Movement Behaviour Profiles and Body Composition: A Latent Profile Analysis of 24-h Time-use Composition among Pregnant Women

M.A. Oviedo-Caro¹, J. Bueno-Antequera², D. Dumuid³, D. Munguía Izquierdo²

¹University of Seville, Department of Physical Education and Sport, Seville, Spain, ²University Pablo de Olavide, Seville, Spain, ³University of South Australia, Adelaide, Australia

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: This study aims to identify movement behaviours profiles and to investigate their association with pregnant women body composition.

Methods: 24-h hours activity behaviours were objectively assessed using an accelerometer at mid-pregnancy in a sample of 137 pregnant women. Activity composition was created from the accelerometer time spent in sleep, sedentary behaviours (SB), light intensity physical activity (LPA) and moderate-to-vigorous intensity physical activity (MVPA) using a default sequential binary partition. Body composition was assessed using a bioelectrical impedance device to determine BMI, BAI, fat mass, muscle mass, bone mass, and total body water (TBW)), and a skinfold caliper to measure the sum of skinfold thicknesses. Movement behaviour profiles were determined using latent profile analyses of isometric log-ratios of the 24-h composition. Linear regression models were employed to examine the association between profiles and body composition.

Results: Two distinct profiles were identified: Highly active pregnant women (Cluster 1) were characterised by engaging in significantly higher levels of LPA and MVPA ($p<0.001$) and spending less time in SB compared with low active pregnant women (Cluster 2) ($p<0.001$), while no significant differences were found for Sleep. Highly active pregnant women showed more favourable body composition indicators than low active pregnant women: BMI (-5.0 kg/m²), BAI (-2.9 kg/m²), skinfold thicknesses sum (-4.6 mm), fat mass (-5.1%), muscle mass (+5.1%), bone mass

SHORT ORALS

(+5.0%), and TBW (+4.9%) (all $p < 0.005$). Linear regression models indicated that the cluster grouping, in addition to the Pre-pregnancy BMI, was significantly associated with fat mass, muscle mass, bone mass and total body water when the model is controlled by potential confounders. When confounders were excluded, cluster grouping is also significantly associated with BMI, BAI, and skinfold thicknesses sum.

Conclusion: Movement behaviour profiles among time-use composition are associated with body composition during pregnancy. Pregnant women classified as highly active profile, by engaging in higher levels of LPA and MVPA physical activity and spending less time in sedentary time, exhibited more favourable body composition indicators. In addition to pre-pregnancy BMI, the findings highlight the potential importance of promoting higher physical activity levels during pregnancy for maintaining healthier body composition.

SO.3.32-09

Evaluation of a Co-creation Process to Adapt an Intervention Targeting Adolescents' School-related Sedentary Behaviour

V. Van Oeckel¹, M. Verloigne¹, B. Deforche^{1,2}

¹Ghent University, Department of Public Health and Primary Care, Ghent, Belgium, ²Vrije Universiteit Brussel, Department of Movement and Sport Sciences, Brussels, Belgium

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice
Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Co-adaptation is a collaborative process through which existing public health interventions are adapted to new contexts, offering a promising way for scaling them. Little is known about how co-adaptation processes are implemented. However, the implementation of a co-adaptation process can strongly influence participants' experiences with the co-adaptation process as well as the relevance, acceptability and quality of the adapted intervention. This study therefore evaluates the implementation of and participants' experiences with a co-adaptation process of a previously co-created intervention targeting adolescents' school-related sedentary behaviour.

Methods: Two secondary schools in Flanders, Belgium, including all Grade 7 and 8 classes, participate in the study. In each school, three co-adaptation sessions involving researchers and a representative group of pupils and teachers, will be conducted between November 2025 and January 2026. The sessions will be guided by the *Intervention Mapping Adapt* framework. Data on the implementation of and experiences with the co-adaptation process will be collected by researchers completing a reflection form after each session. Additionally, one focus group with pupils and one with teachers per school will be conducted after the co-adaptation process. Data will be analysed in MAXQDA using reflexive thematic analysis.

Results: As the co-adaptation process has not yet started, results are not available at this stage. At the conference, we will present the evaluation of the implementation of the co-adaptation process and findings on pupils', teachers', and researchers' experiences with the co-adaptation process.

Conclusion: Evaluating the co-adaptation process will provide insights to guide future adaptations of public health interventions together with the target group and other key partners, supporting the development of more acceptable, relevant and sustainable interventions.

SO.3.32-10

"I Feel Seen and Connected": A Mixed Method Study on Culturally Tailored Videos to Enhance Sense of Belonging among ITCA WIC Participants

S. Raval¹, K. Robinson¹, B. Ronan¹, F. Acciai¹, M. Jossefides², N. Vaudrin O'Reilly², E. Melnick¹

¹ASU, Phoenix, United States, ²ITCA Wic, Phoenix, United States

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice
Room 7, May 30, 2026, 10:00 AM - 11:00 AM

SHORT ORALS

Purpose: The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) is a U.S. federally funded program providing monthly nutritious food benefit packages, nutrition education, breastfeeding support and health referrals to low-income women, infants, and children up to age five. WIC helps address high food insecurity rates and nutrition-related health concerns in American Indian communities. However, low participation rates among the eligible population (56% in the US state of Arizona), and barriers such as perceived stigma hinder program engagement. This mixed-methods study evaluated perceptions of short, culturally-tailored digital video content for social media, as well as their effectiveness in fostering a greater sense of belonging (SoB) among eligible participants.

Methods: The study employed a convergent mixed-methods design. Surveys were administered to ITCA WIC participants before (January 2024; N=1,587) and after (July 2024; N=1,632) video dissemination through social media channels. Quantitative data measured SoB using an eight-statement scale, complemented by social media metrics (reach, impressions, and engagements). The qualitative component involved thematic analysis of post-intervention open-ended survey feedback on video perceptions.

Results: In the post-video survey, a significantly higher percentage of respondents agreed or strongly agreed with 7 of the 8 statements about positive SoB in WIC. For example, agreement with “WIC is a part of my community” increased from 91.6% to 97.6% ($p < 0.001$), reflecting a stronger sense of belonging within the ITCA WIC community after the video dissemination. Preliminary qualitative analysis validated these findings, revealing that participants highly valued the content, with three dominant themes emerging: Cultural Representation, Relatability, and Informational Value. Participants expressed that seeing Native individuals in the videos and content that reflected their lifestyles was crucial to feeling connected and seen. Other dominant themes included the content’s strong informational value and its engaging presentation that promoted a sense of community.

Conclusion: Overall, these findings suggest that culturally specific digital outreach strategies are highly effective tools for increasing a sense of community, connection, and belonging among American Indian WIC participants. This approach holds significant promise for increasing program engagement and mitigating social barriers to WIC participation among other marginalized communities.

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Patient and Public Involvement (PPI) is increasingly recognised as a foundation of relevant, equitable, and impactful behavioural, nutrition, and physical activity research. Doctoral studies provide a pivotal opportunity to embed these principles early in researchers’ careers, cultivating future leaders who view engagement and collaboration as core scientific practices. Yet there remains limited guidance on how to deliver meaningful, sustained PPI within doctoral contexts. This paper presents co-produced reflections and practical recommendations developed through collaboration between doctoral researchers, public contributors, and a PPI coordinator. The goal was to identify transferable approaches that strengthen authentic involvement, build capacity, and promote equity across health and behavioural research settings.

Methods: The team adopted a participatory co-production process using online surveys, facilitated discussions, and iterative reflection. Drawing on experiences from multiple doctoral projects, contributors jointly analysed enablers and barriers to effective involvement. The process emphasised both “space to talk,” encouraging open dialogue, and “space to change,” allowing adaptation of ideas and roles in real time. Collective insights informed a framework of recommendations directed at doctoral researchers, PPI contributors, and institutional coordinators.

Results: PPI improved research quality, recruitment, and accessibility, while enhancing communication and reflexivity among early-career researchers. Contributors valued the opportunity to shape study design, interpret findings, and influence outcomes relevant to lived experience. Key challenges included managing emotional topics,

SHORT ORALS

limited time and resources, and variable institutional support. The coordinator role emerged as essential for bridging communication, managing reimbursement, and ensuring continuity. Recommendations highlight early planning, trust-building, accessible communication, shared learning, emotional support, and structural funding for involvement as critical success factors.

Conclusion: Authentic PPI enriches doctoral research by fostering scientific rigour, inclusivity, and translation of behavioural evidence into real-world impact. Embedding PPI training, recognition systems, and coordinator roles within doctoral programmes can normalise co-production and create more responsive research cultures. These recommendations offer a practical roadmap for integrating public involvement across disciplines, advancing equity, implementation, and the societal relevance of future behavioural and public health research.

Co-designing Community Priorities to Promote Youth Health and Sustainable Lifestyles: Findings from the SCORE! Youth SHAL Calgary Site

M. Kwan¹, G. Vetro², R. Stennett³, R. de Souza³, D. Desai³, D. Sherifali³, S. Kandasamy³

¹Brock University, St. Catharines, Canada, ²Calgary Catholic Immigration Society, Calgary, Canada, ³McMaster University, Hamilton, Canada

SO.3.32 Participatory Research in Health Promotion: Integrative Perspectives on Movement Behaviors: Mental Health, Metabolic Outcomes, and Inclusive Practice

Room 7, May 30, 2026, 10:00 AM - 11:00 AM

Purpose: Cardiovascular diseases such as heart attack and stroke are largely preventable, yet their early risk factors — poor diet, low physical activity, and sedentary behaviour — are increasingly observed in youth, particularly in urban settings. The *SCORE! Youth SHAL* (Sustainable Healthy Active Living) project aims to prevent these risks while fostering environmental sustainability by promoting outdoor activity, active transportation, and consumption of locally grown foods. The purpose of this study was to conduct co-design workshops with youth residing in at-risk communities in Calgary to identify priorities for community-based interventions that could promote healthy eating and active living while considering environmental impacts.

Methods: Using a participatory co-design framework, 32 youth (ages 12–18) took part in one of two 3-hour workshops. Employing the MoSCoW prioritization method (“Must-Have,” “Should-Have,” “Could-Have”), participants collaboratively identified and ranked feasible and desirable intervention strategies. The process emphasized youth voice, feasibility, and alignment with community strengths and context.

Results: “Must-Have” priorities reflected immediate, actionable needs: improved food labeling and education about ingredients, social-media-based cooking tutorials, access to free exercise spaces near neighbourhoods, reducing screen time, and creating walkable, low-pollution cities. “Should-Have” items highlighted household and seasonal adaptations such as balanced meal planning, batch cooking, winter activity planning, and affordable markets. “Could-Have” priorities emphasized social connection through affordable gyms, outdoor recreation, community events, and volunteer-led sport programs.

Conclusion: Youth co-design workshops revealed that health promotion must address not only individual behaviours but also environmental and infrastructural barriers to healthy living. These findings will inform the next phase of *SCORE! Youth SHAL*, which will co-develop and pilot test community-based interventions grounded in the identified priorities. This participatory, strength-based approach offers a model for sustainable, youth-driven health promotion across diverse community contexts.

Transferring the Promotion of Physical Activity in Primary Schools from a Feasibility Trial to an Implementation in the Real World: The Bremen Activeschools

M. Brandes¹, L. Sell¹, R. Schleicher¹, H. Busse¹, H. Zeeb¹

¹Leibniz Institute for Prevention Research and Epidemiology - BIPS, Prevention and Evaluation, Bremen, Germany

S.1.01 Motivation and behavior change: Addressing the Complete Picture: Advancing the Promotion of Physical Activity in School-Aged Children During School Terms and Holidays

Auditorium, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Following the promising findings of a feasibility cluster-randomized controlled trial, the ACTIPROS approach (promoting physical activity in primary school children by participatory choosing from a set of 12 evidence-based physical activity interventions) is currently being prepared for scale-up in the German Federal State of Bremen. Potentially, ~100 primary schools are available to join this subsequent 5-year-project, called Bremen Active Schools (BAS). To reach as many primary schools as possible, multiple efforts are implemented to promote BAS as an attractive project for schools.

Methods: The qualitative measures implemented for promoting BAS include local stakeholders' workshops (n=3), an exchange with similar projects from other countries (n=2), a world café with local stakeholders from a deprived district, and interviews with local school administrators (n=20). Findings of the measures are intended to inform the name, branding and social marketing of BAS. The social marketing and the recruitment of schools for BAS will commence in January 2026.

Results: Following the findings of the stakeholder workshops and the world café, a German name for the project was selected ('AktivSchule Bremen'). The positive impact of physical activity on educational outcomes and social interactions was chosen to be at the forefront of the social marketing of BAS, resulting in the branding claim 'Education.Physical Activity.Together' ('Bildung.Bewegung.Miteinander'). The world café and interviews indicated that BAS should highlight the ease of implementation, the participatory approach of the intervention selection process, the close cooperation of schools and the research institute, low costs and limited additional work required in the marketing materials to schools (website, newsletter, flyers, etc.). Results from the recruitment process will be added at the conference.

Conclusion: This study provides insight into the development of the social marketing process of BAS, in order to transfer the ACTIPROS approach as tested in a feasibility trial towards a scale-up in the real world. We demonstrate how findings from multiple qualitative activities can be applied to this transition, and hope to inspire researchers and stakeholders on how to transfer findings from controlled conditions to real-world settings. Findings from the recruitment process will serve as an indicator of success in our approach.

S.3.50-2

From Evidence to Implementation: Building Sustainable Pathways for the Active School Concept in Switzerland

F. Egger¹, M. Gasser¹, A. Nadenbousch², M. Kamer¹, S. Valkanover², M. Schmidt¹

¹University of Bern, Institute of Sport Science, Bern, Switzerland, ²Bern University of Teacher Education, Centre of Subject Didactics, Bern, Switzerland

S.1.01 Motivation and behavior change: Addressing the Complete Picture: Advancing the Promotion of Physical Activity in School-Aged Children During School Terms and Holidays

Auditorium, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Swiss adolescents spend most of their school day sedentary and fail to achieve sufficient levels of physical activity (PA). Schools are recognized as key settings for promoting PA, as they provide inclusive environments to reach all students. Based on the CSPAP framework, *Active School 1.0* was designed and implemented to promote daily PA opportunities and reduce sedentary behavior during the school day. Extending the CSPAP approach, *Active School 1.0* placed particular emphasis on training two teachers per school as Physical Activity Leaders (PALs). Through targeted workshops, these PALs developed the skills and capacity to promote PA within their schools. Building on the

evaluation findings, the planning of *Active School 2.0* is underway to develop sustainable and scalable structures for PA promotion within the Swiss school system.

Methods: The evaluation of *Active School 1.0* is based on a cluster-randomized controlled trial involving 12 secondary schools and 703 students (aged 12–16 years) over a two-year period. A mixed-methods approach captured both effectiveness and implementation processes. Quantitative data from accelerometer-based MVPA measurements and questionnaires were complemented by qualitative data from document analyses, ripple effect mapping, and semi-structured interviews, providing a deeper understanding of how the program works, for whom it is effective, and under which conditions.

Results: Preliminary quantitative results indicate a tendency toward increased school-based MVPA, particularly during classroom instruction. Qualitative findings emphasize that successful PA promotion requires time, guidance, and intrinsically motivated PALs who can anchor PA practices in everyday school routines. Building on these insights, *Active School 2.0* addresses the need for systematic mentoring, capacity building, and long-term support through participatory development. Two core components define this next phase: (1) a coach-the-coach system, in which former PALs participate in two workshops to become mentors and coach new PALs during implementation, and (2) a Community of Practice promoting peer learning and networking through annual conferences and regional meetings.

Conclusion: *Active School 2.0* marks the transition from an evidence-based intervention to a sustainable, system-level approach embedded in school development and teacher education. Fostering mentoring and regional learning communities, it provides the foundation for a national framework to sustainably integrate physical activity into Swiss schools.

S.3.50-3

Addressing Unhealthy Behaviors and Weight Gain in the Summer: Evidence from Four Randomized Controlled Trials

M. Beets¹, R.G. Weaver¹, S. Burkart¹, B. Armstrong¹, E. Adams¹

¹University of South Carolina, Columbia, United States

S.1.01 Motivation and behavior change: Addressing the Complete Picture: Advancing the Promotion of Physical Activity in School-Aged Children During School Terms and Holidays

Auditorium, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: There's growing recognition that summer vacation/holiday from school is a high-risk timeframe for unhealthy behaviors (e.g., low activity levels) and accelerated weight gain in children. In summer, the most at-risk group are those children from low-resourced areas. A leading explanation for this phenomenon is the Structured Days Hypotheses (SDH) which states structured settings, like school, promote healthy behaviors via environmental control and limit setting. For the majority of children, summer represents an extended period of time with less structure than the school year. Accessing structured programming in summer (e.g., summer day camps, SDC) is an out-of-pocket expense, thereby creating a financial barrier for families from low-resourced areas. One solution is providing free access to pre-existing community-operated summer programs. This presentation will provide an overview, findings, and future directions from three ongoing, and one recently completed, large-scale RCTs addressing unhealthy behaviors and weight gain during summer among children (3-12yrs).

Methods: The four RCTs intervention approach is providing free access to pre-existing, community-operated SDC (5-12yr olds) or center-based childcare (3-4yr olds) for families from low-resourced areas. Importantly, no changes to routine practice occurs – the programs operate “as usual” without any outside (i.e., researcher) requested enhancements/modifications.

Results: The RCTs address questions related to 1) the efficacy of providing SDC during the summer (Voucher RCT, N = 422) or free childcare (Voucher Early Years, N = 300); 2) how many weeks of SDC are necessary to improve health behaviors and reduce weight gain (DOSE, N = 360); and 3) what is the year-round impact on health behaviors and weight gain from providing both free SDC and free afterschool programming (Beyond the Bell, N = 480). Outcomes presented include changes in physical activity, sleep, diet, and screen use, and anthropometrics (BMI/percent body fat). Spillover effects on parents will also be discussed.

Conclusion: Despite the epidemiological evidence from 4 decades of the negative health effects of summer on children, few interventions have been tested for this timeframe. The cumulative evidence from these four RCTs has the potential to inform policies at the local, state, and national level to address childhood obesity.

S.1.02-1

Co-developing Local Policy Solutions for Equitable, Healthier Restaurant Food Environments

M. Fuster¹, M.M. Muñoz¹, M. Faughnan², A. Bilfield³

¹Tulane Celia Scott Weatherhead School of Public Health, Social, Behavioral, and Population Sciences, New Orleans, United States, ²Tulane University, Taylor Center, New Orleans, United States, ³Tulane University, Freeman School of Business, New Orleans, United States

S.1.02 Policies and environments: Collaborative approaches to transform retail food environments for health promotion

Room 1, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: This study applied systems science and human-centered design (HCD) to co-identify policy-based solutions that facilitate the provision of nutrient-rich, locally-sourced offerings in independently-owned in New Orleans, Louisiana. Restaurants play a pivotal role as intermediaries between consumers and locally grown foods. Yet, the adoption of locally sourced, nutritious ingredients remains limited among independently owned, economically accessible establishments. This challenge reflects a dynamic interplay of multi-level barriers and facilitators that require systemic, participatory approaches to understand and address.

Methods: Through the Voices at the Table project, we conducted a total of seven workshops with restaurant owners, producers, government representatives, and food system organizations (n=15, on average, per session). The 2-hour, in-person sessions incorporated facilitation techniques from HCD (Liberating Structures) and group model building (GMB) to elicit systems-based barriers and potential leverage points for change. Each workshop ended with a debriefing discussion and survey, and summaries of findings were shared with participants after each meeting. Findings were summarized into a causal loop diagram (CLD) that was expanded and refined through a dedicated GMB session, where participants mapped and developed new solutions. The GMB exercise was followed by a debriefing meeting to share the revised CLD. This presentation will also incorporate our final workshop (December 2025), in which government and local food organizations will co-develop an implementation for the co-identified solutions.

Results: Participants identified reinforcing and balancing feedback loops influencing the provision of nutrient-rich, locally grown foods in restaurants. Key themes included perceived customer demand, economic pressures, operational constraints, and supply chain coordination challenges. Leverage points included incentive programs, consumer education, recognition mechanisms, and supportive local policies and services. Results will also integrate final feedback from participants on prioritized solutions.

Conclusion: This work demonstrates how participatory systems approaches can help identify opportunities for collaborative action within local food environments, including independently-owned restaurants, an under-engaged sector. The CLD served as both a research and policy tool, informing interventions that align economic, social, and public health objectives. Insights from this work contribute to broader discussions on multi-level strategies to foster equitable, resilient, and health-promoting food environments.

Towards Healthier Retail Food Environments in East Asia: From Monitoring to Collaborative Action with Retailers and Policymakers

A. Cameron¹, T. Scapin¹, C. Gomez-Donoso^{1,2}, A. Feeley³

¹Deakin University, Global Centre for Preventive Health and Nutrition (GLOBE), Melbourne, Australia, ²Open University of Catalonia, Nutraliss, Barcelona, Spain, ³UNICEF, East Asia and Pacific Regional Office, Bangkok, Thailand

S.1.02 Policies and environments: Collaborative approaches to transform retail food environments for health promotion

Room 1, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Diet-related non-communicable diseases represent a major and growing health burden in the East Asia and Pacific (EAP) region. This concerning trend has been partly attributed to changes in the retail food environment over recent decades, which have led to unhealthy foods becoming increasingly available, more affordable, and more heavily promoted. Recognising the pivotal role that food retail companies play in shaping purchasing behaviours through their business practices, UNICEF launched an initiative in EAP aimed at improving the retail food environment

for children.

Methods: A co-created research agenda led to the development of a healthy food retail initiative for obesity prevention across five East Asian countries launched by UNICEF's East Asia and Pacific Regional Office and Deakin University. The initiative involved: 1) a series of landscape analyses and monitoring studies assessing the healthiness of physical and online retail food settings and how people interact with them; 2) a knowledge-sharing platform and network of key interest-holders; and 3) a business case for action and collaboration with retailers, governments, and industry associations to implement evidence-based interventions.

Results: Assessments of product availability and marketing strategies across supermarkets, convenience stores, informal street food vendors, online grocery retailers, traditional stores and meal delivery apps showed that unhealthy products were disproportionately available and widely promoted through a broad range of marketing strategies. The established network brought together over 80 interest-holders engaged in advancing the healthy food retail initiative agenda. Based on a guidance framework informed by expert input and international best practices, as well as a business case developed using results of landscape analyses, contact was made with at least 27 major food retailers across the region. Of these, 10 were actively involved in implementing healthy food retail initiatives in collaboration with government policymakers supporting this agenda.

Conclusion: This pioneering initiative provides a critical foundation for understanding the key aspects of retail food environments in the EAP region and identifying opportunities to improve their healthiness. The findings support the prioritization of public health policies, encourage voluntary actions by retailers, and offer a roadmap to guide retailer engagement in co-designing healthy retail interventions.

S.1.02-3

Creating Healthier Layouts in Discount Supermarkets in England: Outcomes on Store Sales, Customer Purchasing, Diet and Household Waste

C. Vogel¹, S. Crozier², P. Dhuria², J. Lord², G. Moon², W. Lawrence², J. Cade³, K. Ball⁴, C. Cooper², J. Baird²

¹Centre for Food Policy, City St George's, University of London, London, United Kingdom, ²University of Southampton, Southampton, United Kingdom, ³University of Leeds, Leeds, United Kingdom, ⁴Deakin University, Geelong, Australia

S.1.02 Policies and environments: Collaborative approaches to transform retail food environments for health promotion

Room 1, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Previous product placement trials have been small and limited in outcomes. Discount supermarkets have less healthy environments than other supermarkets and are frequently used by families experiencing deprivation. This study assessed the effects of a retailer-led intervention which positioned an expanded fruit and vegetable section near the entrances of discount supermarkets on store-level sales, household-level purchasing and waste, and dietary behaviours.

Methods: This prospective matched controlled cluster trial involved 36 stores (18 intervention and 18 control) of a discount supermarket chain in England. The intervention was implemented for six months. Control stores were matched on store sales, customer profiles and neighbourhood deprivation. Women customers aged 18 to 60 years, with loyalty cards, who shopped at intervention (n=280) or control (n=300) stores agreed to participate.

Results: Interrupted time series analyses showed increases in store-level sales of fruit and vegetables were greater in intervention stores than predicted at intervention implementation (0.32SDs (95%CI 0.11, 0.53), p=0.002) and 3-months (0.23SDs (95%CI -0.05, 0.52), p=0.10) and 6-months follow-up (0.18SDs (-0.16, 0.52), p=0.29), equivalent to ~2525 (95% CI 775, 4115), 1940 (95% CI 380, 3950) and 1450 (95% CI -945, 3950) extra portions per store, per week respectively. Effect sizes were somewhat stronger in stores where the produce section moved forward further. The proportion of households purchasing fruit and vegetables in intervention compared to control stores was very similar at baseline (-0.1% (95%CI -6.1%, 6.0%)) but somewhat higher after 3- (0.6% (95%CI -5.6%, 6.7%)) and 6-months (3.3% (95%CI -2.5%, 9.2%)) exposure to the intervention. Changes in dietary quality were small but generally in the direction for health benefit. Change in frequency of household vegetable waste was negligible at 3-month follow-up but increased at 6-months.

Conclusion: Positioning produce sections near supermarket entrances can improve the nutrition profile of store sales and may improve household purchasing and dietary quality. Government regulations to curb unhealthy placement marketing being used in retail outlets should consider requiring the placement of a fruit and vegetables section at store entrances alongside limiting placement of unhealthy foods in locations such as checkouts, aisle-ends and store entrances to maximise their health benefit.

SYMPOSIUM

S.1.03-1

Advancing the Precision of Sedentary Behaviour Guidelines: Current Evidence and Opportunities

D. Dunstan¹, N. Owen²

¹Baker Heart & Diabetes Institute, Physical Activity, Melbourne, Australia, ²Swinburne University of Technology, Health Sciences, Melbourne, Australia

S.1.03 Cancer prevention and management: Identifying Behavioural Antidotes to Too Much Sitting: Findings and Implications From Two Nationally Funded Controlled Trials

Room 2, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Current physical activity guidelines from global and disease-specific bodies, including the World Health Organization and the American Diabetes Association, provide only general recommendations to reduce and interrupt sitting, with limited specificity regarding sedentary behaviour. Identifying and integrating practical, evidence-based strategies into these guidelines is crucial for effectively supporting the growing population of physically inactive, overweight/obese middle-aged and older adults at risk of or living with type 2 diabetes.

Methods: Current international and disease-specific guidelines on sedentary behaviour were reviewed to assess their scope and recommendations. A parallel review was conducted of recent experimental studies and systematic reviews assessing both the short and longer-term metabolic health effects of reducing and interrupting sitting time, with particular attention to variations by age and gender. The analysis focused on identifying evidence gaps and opportunities for greater guideline specificity.

Results: Recent findings suggest that regular interruptions to prolonged sitting provide short-term glycaemic benefits; however, the optimal interruption patterns and underlying mechanisms have yet to be established. The longer-term effects are beginning to be characterised. For example, in a three-month randomised controlled trial involving overweight and obese post-menopausal women, two sedentary behaviour interventions – ‘sit less’ and ‘sit to stand’ (STS) - were compared with a healthy living control¹. The STS intervention led to a statistically significant reduction in diastolic blood pressure (main difference: -2.2 mmHg; $p < 0.05$) compared to control, while the ‘sit less’ group showed no significant change. Neither intervention affected glycaemic outcomes. These findings suggest that increasing sit-to-stand transitions can modestly improve blood pressure in older women with overweight or obesity; additional research is needed to determine whether similar cardiovascular or glycaemic benefits can be achieved in individuals with, at risk of, type 2 diabetes.

¹Hartman SJ et al. *Circulation*. 2025 26;152(8):492-504

Conclusion: Current evidence remains insufficient to warrant further specification of sedentary behaviour guidelines with respect to optimal interruption frequency or duration. High-quality research is warranted to define the most effective types and intervals of activity breaks, and to assess whether short-term physiological benefits can be sustained as long-term health improvements.

S.1.03-2

Impact of a ‘Sit Less and Move More’ Intervention on Daily Sitting Time and Glycaemic Control in Type 2 Diabetes: The OPTIMISE Your Health Trial

C.J. Brakenridge^{1,2}, S.J.H. Biddle³, N.D. Cohen², R.M. Daly⁴, P.A. Gardiner⁵, D.J. Green⁶, R.V. Grigg^{2,4}, G.N. Healy⁷, M.L. Moodie⁴, N. Owen^{1,2}, E. Winkler⁷, D.W. Dunstan^{2,4}

S.1.03 Cancer prevention and management: Identifying Behavioural Antidotes to Too Much Sitting: Findings and Implications From Two Nationally Funded Controlled Trials

Room 2, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: To investigate the impact of a 'sit-less and move-more' sedentary behaviour intervention on device-measured daily sitting time and glycated haemoglobin (HbA1c) in office workers with type 2 diabetes (T2D) over 6 months (primary endpoint).

Methods: In total, 145 office working adults (35-65 years old), overweight/obese, physically inactive, with managed (6.5 – 10.0% HbA1c) T2D were randomised to receive usual care (n=72) or a multicomponent intervention, consisting of health coaching, a height-adjustable sit-to-stand desk, and an activity tracker (n=73). Daily sitting, standing, and stepping time (standardised to 16-h waking time, measured via thigh-worn accelerometer worn continuously for 10 days), and HbA1c were assessed at baseline, 3- and 6-month follow-ups. Analyses were conducted using linear mixed models accounting for repeated measures, baseline values, baseline glucose-lowering medication use, age, and gender. Significance was set at two-tailed $p < 0.05$ and $p < 0.025$ for the co-primary outcomes.

Results: Six-month follow-up was completed by 122 (84%) participants (64 intervention, 58 control). Daily sitting time was significantly reduced in the intervention group compared with control participants at 3-months (between group difference: -73 [95%CI: -101, -45] Δ min per 16-h day) and 6-months (-79 [-107, -51] Δ min/16h; $p < 0.001$). Correspondingly, between-group differences favouring the intervention were observed for standing time at 3- and 6-months (+63 [39, 88]; +67 [42, 91] Δ min/16h) and stepping time at both timepoints (+9.6 [1.0, 17.9]; +12.4 [4.1, 20.7] Δ min/16h). The intervention participants also experienced a significant improvement compared to controls in HbA1c at 3- and 6-months (between group difference, -0.4% [-0.8, 0.1]; -0.5% [-1.0, -0.1]; $p < 0.01$), which was due to a decrease (improvement) in intervention participants (adjusted mean change, 3-month: -0.3% [-0.5 to 0.0]; 6-months: -0.2% [-0.4, 0.0]) and an increase in controls at 6-months (+0.3% [0.1, 0.5]).

Conclusion: In overweight/obese, physically inactive, office workers with T2D, this 'sit less and move more' sedentary behaviour intervention achieved clinically significant improvements in glycaemic control, following substantially reduced sitting time (>1 h/day) replaced mostly by standing (>1 h/day) and some stepping ($\approx$ 10 min/day), highlighting the relevance of such interventions for T2D management.

S.1.03-3

Interrupting Sitting: Glycemic Benefit of Seated and Upright Muscle-activity Bursts in Type 2 Diabetes

S. Lamberg^{1,2}, C.J. Brakenridge^{3,4}, P.C. Dempsey⁵, M.J. Wheeler⁵, Y. Gao⁶, D.W. Dunstan^{5,4}, T. Finni², G.N. Healy⁷, N. Owen^{3,4}, A.J. Pesola¹

S.1.03 Cancer prevention and management: Identifying Behavioural Antidotes to Too Much Sitting: Findings and Implications From Two Nationally Funded Controlled Trials

Room 2, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Active interruptions to sitting are known to beneficially influence glucose and insulin in inactive adults with type 2 diabetes. These benefits may be through aspects of the increased muscle activity from such interruptions. We examined the glycaemic effects of different modes for interrupting sitting, and the role of durations and bursts in gluteal, hamstring and quadriceps muscle activity, assessed using shorts with fabric-embedded electromyography (EMG).

Methods: Inactive overweight/obese adults with type 2 diabetes (n = 24; 15 women; 61.3 $\pm$ 8.1 y) participated in a randomized crossover trial with four 6.5-h/d experimental conditions: uninterrupted sitting (control; SIT); or, sitting with six active interruptions each hour of 30-min standing (STAND), 6-13-min seated pedaling (PEDAL), or 2-7-min sit-to-stand transitions (SST). The active interruption conditions were matched on total muscle activity. Incremental areas under the curve (iAUCs) for glucose and insulin were compared between upright and seated interruption conditions, and the effects on glucose and insulin of EMG activity durations [%] and usual muscle activity bursts [%EMG_{MVC}] and were examined with mixed models.

Results: Compared to SIT, PEDAL and SST significantly attenuated glucose iAUC (PEDAL: iAUC -21.1.7%, 15.1 mmol [95% CI= 10.2,22.4]; SST: -22.9%, 14.7 [9.9,22.0], insulin iAUC (PEDAL: -29.2%, 530.4 pmol [383.6, 733.4]; SST: -26.8%, 548.0 [396.0, 761.2]) but STAND did not. Higher quadriceps muscle activity bursts were inversely associated with glucose (β = -0.13[-0.04, -0.00]) and insulin (-0.13[-0.12, -0.00]); muscle activity durations were not related. Hamstring

SYMPOSIUM

muscle activity bursts (0.01[0.00, 0.02]) were also related, but for gluteals no relationships of muscle activity durations or bursts were apparent.

Conclusion: Interrupting sitting with dynamic muscle activity, whether seated or upright and characterized by higher quadriceps muscle activity bursts, enhances glycaemic control in type 2 diabetes. Interruptions to prolonged sitting that can optimize muscle activity bursts may efficiently offer health benefit for those with diabetes, and potentially for those who are living with, or at risk of, other ageing-related metabolic disorders. Further evidence is needed on the long-term glycaemic and other health benefits of muscle activity bursts.

SUPER-AIM: A Holistic Framework to Evaluate Systems-informed, Co-creation Projects in Public Health

C.S. Pawlowski¹, T. Altenburg², M.J.M. ChinAPaw²

¹University of Southern Denmark, Department of Sports Science and Clinical Biomechanics, Odense, Denmark,

²Amsterdam UMC, Department of Public and Occupational Health, Amsterdam, Netherlands

S.1.04 Participatory Research in Health Promotion: CANCELLED: The YoPA Project: latest insights from a youth-centered participatory research and systems dynamics approach

Room 3, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: No comprehensive evaluation framework has been designed for systems-informed co-creation projects within the field of public health. In response to this gap, a novel evaluative framework—the SUPER-AIM framework—adapted from the well-established RE-AIM model is developed and proposed. Drawing on a real-world systems-informed co-creation project aimed at enhancing health in youth, the YoPA project, the aim is to present the practical application of the SUPER-AIM framework in the evaluation of all key aspects of this systems-informed co-creation project.

Methods: The SUPER-AIM framework is specifically designed to evaluate the process and effects of co-creation projects for public health across eight interrelated components: Systems, User Perspective, Participatory Process, Effect, Reach, Adoption, Implementation, and Maintenance. These components operate across multiple levels (e.g., individual, organizational, and community) and are interrelated, shaping the overall impact of co-creating and implementing public health interventions.

Results: Within the Systems component, action teams used multiple participatory methods (e.g., photovoice, interviews, questionnaires) to map drivers of unhealthy movement behaviors and wellbeing through Causal Loop Diagrams. The User Perspective component involved community focus groups assessing the acceptability and accessibility of co-created actions for adolescents in vulnerable settings. The Participatory Process was evaluated using facilitator logbooks, reflection forms, and focus groups to assess adolescents' satisfaction with co-creation. Under Effect, pre-post questionnaires (n=200) and systematic observations measured life satisfaction, peer relationships, agency, and physical activity, supplemented by a Realist-informed Ripple Effects Mapping exploring (un)intended outcomes. Reach was assessed via demographic and participation questionnaires identifying whether the target group was engaged. Adoption captured stakeholder engagement through interviews examining their commitment to co-creation and implementation. Implementation was documented using facilitator logs and project records detailing delivery, adaptations, action quality, and costs. Finally, Maintenance was explored through stakeholder interviews 12 months post-implementation to evaluate sustainability of the co-created actions.

Conclusion: Evaluating all eight components in a co-creation project is crucial for understanding the mechanisms that explain how and why the project succeeds or fails, and under which conditions. Although a comprehensive evaluation of all components can be resource-intensive, we encourage using the SUPER-AIM framework to enable a more complete assessment of co-created public health interventions in the future.

From Co-creation to Action Plan: Intervention, Context, Actors, Mechanism, Outcome (ICAMO)-guided Physical Activity Systemic Action Plan for Adolescents in Nigeria

A.B. Ogunleye¹, D.R. Omotoso², A.C. Okafor³, A.S. Adebisi¹, A.L. Oyeyemi^{3,4}

¹Value Re-Orientation for Community Enhancement (VARCE), Gender and Education Department, Osogbo, Nigeria, ²Redeemer's University, Department of Human Anatomy, Ede, Nigeria, ³Redeemer's University, Department of Physiotherapy, Ede, Nigeria, ⁴Arizona State University, College of Health Solutions, Phoenix, United States

S.1.04 Participatory Research in Health Promotion: CANCELLED: The YoPA Project: latest insights from a youth-centered participatory research and systems dynamics approach

Room 3, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Nigerian adolescents in disadvantaged communities have limited opportunities for physical activity (PA) and are at risk of non-communicable diseases (NCDs). This study examined how a youth-centered participatory approach can be used to identify barriers to PA and generate practical solutions to improve PA among adolescents (12-18 years) in a low-resource community in Ido Osun, Nigeria.

Methods: A qualitative participatory approach, utilizing group discussions, presentations, mapping, photovoice, interviews, and direct observations. Adolescents (N=22), school staff (N=2), parents (N=2), community and religious leaders (N=4), and public health and urban planning professionals (N=2) participated in 10 co-creation sessions to explore factors that promote and limit adolescents' PA in school and community environments. Insights were visualized through a system map that highlighted connections and relationships among the identified factors of PA. An action plan was developed to outline practical solutions, including core activities/actions. Each action was articulated using the innovative ICAMO framework, specifying the intervention, context, actors, mechanisms, and expected outcomes.

Results: Identified limiting factors include limited infrastructure for PA, safety concerns about strangers' intrusion into school open spaces, absence of Physical and Health Education (PHE) tutors, lack of organized activities, and unavailability of social and physical security measures. The connections highlighted in the system map include perceived safety, number of strangers in outdoor spaces, inclusive space design, access to outdoor space, availability of physical safety measures, maintenance of outdoor space, and availability of social safety measures. The resulting action plan identified practical solutions, including fencing the school environment to ensure safe outdoor spaces, engaging a PHE tutor to facilitate structured PA sessions and classes, engaging security personnel to maintain safety, and implementing a 12-week after-school PA program tailored to adolescents' needs. The ICAMO descriptions ensured transparency by showing how each action functions, who is responsible, and the mechanisms for achieving the expected outcomes.

Conclusion: Our participatory, context-driven co-creation approach, system mapping, and ICAMO-guided action plans provide a practical, evidence-based solution to improve adolescents' PA in a disadvantaged community in Nigeria. This approach can be scaled up as a practical community-led solution to addressing physical inactivity and NCDs in other low-resourced settings.

S.1.04-3

Mechanisms Driving the Lack of Physical Activity in Adolescents in Local Communities in Europe and Africa: Insights from Developing Systems Maps in the YoPA Project

SYMPOSIUM

S.1.04 Participatory Research in Health Promotion: CANCELLED: The YoPA Project: latest insights from a youth-centered participatory research and systems dynamics approach

Room 3, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Worldwide, 81% of adolescents do not meet physical activity (PA) guidelines, which is considered a complex problem. In YoPA, the systems influencing PA in adolescents in vulnerable life situations is depicted through the development of causal loop diagrams (CLDs) in five local communities in Europe and Africa. This presentation provides insights into the mechanisms driving the lack of PA, specifically for adolescents in a local community in Portugal and overall across the five communities.

Methods: One practical protocol was developed to apply youth-centred participatory action research (YPAR) and systems dynamics in local communities in Denmark, the Netherlands, Nigeria, South Africa and Portugal. Adolescents (n=4-22) were actively involved as co-researchers in 7-16 participatory sessions aimed at developing stories explaining the lack of PA in adolescents, using various participatory methods (e.g., photo-voice, neighbourhood walks). Adult stakeholders (n=2-10) participated in one session. Based on the developed stories, researchers created CLDs, depicting the mechanisms driving adolescents' lack of PA in local communities, and identified similarities and differences in mechanisms driving adolescents' lack of PA across all CLDs.

Results: The CLD of the local community in Portugal revealed the following five key themes:

- (1) quality and maintenance of public spaces,
- (2) safety and surveillance,
- (3) social cohesion and community relations,
- (4) availability and accessibility of PA opportunities, and
- (5) behavioural and lifestyle patterns.

Preliminary analysis of all CLDs revealed six common themes:

- (1) accessibility of well-maintained outdoor (public) spaces,
- (2) safety,
- (3) availability and accessibility of extracurricular PA,
- (4) time available for PA,
- (5) peer influence and
- (6) mental health.

The underlying causes of these themes differed between local communities, e.g., lack of safety was caused by community crime and gender-based violence in South Africa and by a fear of being judged in the Netherlands.

Conclusion: The developed CLDs highlight how environmental and social factors interact to constrain PA in adolescents in local communities in Europe and Africa. The comparison of CLDs of the different local communities revealed similar themes, however, the underlying mechanisms driving adolescents' lack of PA differed. This suggests that the different local communities need different interventions to disrupt these mechanisms.

S.1.05-1

Perceptions of Lifelong Physical Activity, and the Physical Literacy Journey: The Voice of Children and Young People across the Island of Ireland

W. O'Brien¹, S. Belton², O. Farmer¹, O. Murphy¹, E. Murtagh³, S. Connolly⁴, M. Murphy^{5,6}, K. Ferguson⁵, L. Foweather⁷, H. Goss²

¹University College Cork, School of Education, Sports Studies and Physical Education, Cork, Ireland, ²Dublin City University, School of Health and Human Performance, Dublin, Ireland, ³University of Limerick, Department of Physical Education & Sport Sciences, Limerick, Ireland, ⁴Ulster University, School of Sport & Exercise Science, Belfast, United Kingdom, ⁵Ulster University, Belfast, United Kingdom, ⁶Physical Activity for Health Research Centre (PAHRC), Moray House School of Education & Sport, University of Edinburgh, Edinburgh, United Kingdom, ⁷Liverpool John Moores University, School of Sport and Exercise Sciences, Liverpool, United Kingdom

S.1.05 Children and families: Translating Physical Literacy into Policy and Practice

Room 4, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: In recent years, the respective physical literacy (PL) journeys for children and young people (CYP) have become increasingly relevant to physical activity (PA), physical education (PE) and sports settings. While research has documented understanding of PL among specific stakeholders, such as physical educators and sports coaches, no such research exists regarding the voice of CYP across the island of Ireland (Northern Ireland and Ireland). This study explored CYP's (aged 3-18 years) perceptions of lifelong PA and their PL journey, including factors which they believed

to have influenced their involvement in, or avoidance of, PA, PE, and sport.

Methods: Conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) extension for scoping reviews. Relevant peer-reviewed and scholarly grey literature was identified through database searching, followed by manual hand searching of reference lists, key journals, and author networks. Searches were conducted for studies published from January 1st, 2010, to October 24th, 2025, and screened against pre-determined inclusion criteria. Data was extracted using charting methods and thematic analysis. To ensure transparency, clarity, and reflexivity, coding decisions were discussed collaboratively with the wider research team, who acted as ‘critical friends’.

Results: The review examined 31 qualitative research studies conducted across the island of Ireland, published since 2010. Thematic analysis of the data identified the following five key themes in relation to lifelong PA as part of one’s PL journey: (i) providing choice, (ii) fun, (iii) social influences, (iv) competition, and (v) barriers to positive PL journey experiences.

Conclusion: Drawing on the insights from this study, a series of holistic PL promotion strategies have been proposed that reflect what is meaningful to CYP across Ireland and Northern Ireland. These strategies aim to enhance CYP’s commitment to developing holistic PL and to support sustained lifelong engagement in physical activity (PA). Findings have informed the development of a national consensus statement, the first study of its kind internationally, and learnings can and have been transferred into other contexts. Critically, this study highlights meaningful ways for young people to develop a positive relationship with movement, from the perspectives of CYP themselves.

S.1.05-2

THRIVE Principles to Support Positive Movement Experiences and Enact Physical Literacy into Policy and Practice

L. Foweather¹, N. Beckles², D. Cooke³, C. Crane², L. Durden-Myers^{4,5}, N. Green⁶, M. Hallam², E. Mackenzie⁷, J. Malone⁸, T. Smith⁹

S.1.05 Children and families: Translating Physical Literacy into Policy and Practice

Room 4, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Positive, enjoyable and meaningful movement experiences in childhood and adolescence are critical for fostering sustained engagement in physical activity across the lifecourse. Research consistently demonstrates that the environments and interactions surrounding movement influence motivation, competence, confidence and long-term behaviour. Despite increasing interest in physical literacy as a holistic and person-centred orientation to movement, there remains limited cross-sector guidance on how organisations can translate this concept into practice. This study aimed to co-design a set of clear and usable principles to support the enactment of physical literacy across education, community, health and sport settings.

Methods: A co-design process was undertaken with a working group comprising academics (n=3) and system leaders (n=6) with expertise in physical literacy, education, coaching, community development, youth voice and environmental design. The process included iterative workshops and online meetings, concept mapping, and evidence synthesis. Participants explored what constitutes a positive movement experience, how physical literacy can be operationalised through practice rather than theory alone, and how principles could remain flexible enough for diverse settings while retaining a clear conceptual anchor. Drafts were refined through multiple rounds of feedback, sector testing and alignment with the Physical Literacy Consensus Statement for England.

Results: The co-design process generated six principles - THRIVE (Tailored, Holistic, Reflective, Inclusive, Varied, Empowering) - which articulate the conditions and experiences that support individuals to develop and sustain a positive and meaningful relationship with movement. The principles emphasise: designing experiences around people’s strengths, needs, preferences and circumstances; attending to physical, social, cognitive and emotional dimensions; fostering reflection and personal growth; creating welcoming and supportive environments; offering diverse and engaging ways to move; and enabling individuals to contribute to, shape and take ownership of their movement experiences. THRIVE provides a practical, action-oriented framework that organisations can use to review, design and enhance policies, environments and programmes.

SYMPOSIUM

Conclusion: THRIVE offers a shared, cross-sector language for translating physical literacy into practice. By foregrounding positive movement experiences and whole-person development, the principles support systems seeking to embed physical literacy and cultivate lifelong engagement in movement and physical activity.

S.1.05-3

Operationalising Physical Literacy in Primary Schools: Development and Evaluation of a Monitoring and Feedback Tool

A.S. Singh¹, E. Plompen¹, I. van Hilvoorde², J. van der Kamp³

¹Mulier Instituut, Utrecht, Netherlands, ²University of Applied Sciences Windesheim, Human Movement, School and Sport, Zwolle, Netherlands, ³Vrije Universiteit Amsterdam, Faculty of Behavioural and Movement Sciences, Learning and Performance, Amsterdam, Netherlands

S.1.05 Children and families: Translating Physical Literacy into Policy and Practice

Room 4, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: We developed a tool that enables teachers to capture children's physical literacy (PL) within the Dutch primary school context. The tool translates the holistic concept of PL into practical indicators and supports physical education (PE) teachers in using these data to provide tailored physical activity (PA) and sport advice to children and parents.

Methods: Three core domains—motor competence, motivation and confidence, and social competence in PA contexts—were defined through scientific evidence and expert consensus and translated into measurable indicators. We used a combination of quantitative testing and qualitative input from children, parents, and teachers to inform the design. Several pilot studies were carried out in schools across multiple locations to test the feasibility, usability, and perceived added value of the monitoring and feedback tool. Specific attention was given to practical integration within school settings and data-protection compliance.

Results: Children and teachers considered the assessments feasible, understandable, and engaging. Teachers reported that PL-based feedback enhanced their understanding of pupils' strengths and needs and supported individualized PA and sports advice. They valued the tool for a basis for communication with parents and for helping to adapt PE lesson content. Implementation challenges included the time required for data entry, the interpretation of composite indicators, and integration with existing school assessment systems. Teachers emphasized the importance of intuitive dashboards, clear visualizations, and targeted guidance materials to support consistent use in practice.

Conclusion: Operationalizing PL into a practical, teacher-led monitoring and feedback tool offers a promising approach to help teachers guide children and parents toward forms of PA and sport that best fit the child. PL-based monitoring provides a meaningful foundation for individualized feedback and aligns well with the aims of daily educational practice. Sustainable implementation will require further refinement of the user interface, additional teacher training, and a robust data-management infrastructure. Future work will focus on implementation of the tool, strengthening national surveillance and policy development around PL in the Netherlands.

S.1.06-1

Moving from Horizontal to Vertical Scale-up: Opportunities and Challenges with an Australian School-based Physical Activity Intervention - Pre-Recording

J. Salmon¹, N. Lander¹, A. Contardo Ayala¹, E. Mazzoli¹, A. Fitriani¹, E. Ganakas¹, S. Lai¹, J. Della Gatta¹, A. Timperio¹, H. Koorts¹

¹Deakin University, Institute for Physical Activity and Nutrition, Melbourne, Australia

S.1.06 Motivation and behavior change -: School-Based Interventions to Promote Physical Activity: Thorns and Roses

Room 5, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: To describe the challenges and opportunities of linear and non-linear horizontal scale-up and moving to vertical scale up and system level sustainment of school-based physical activity interventions.

Methods: In 2009, the TransformUs whole of school physical activity and sedentary behaviour intervention commenced following a traditional research pipeline of pilot to RCT, then testing of a Type 2 hybrid effectiveness-implementation trial at scale (2017-2022) across primary schools in Victoria, Australia. A less traditional non-linear pathway involved program adaptation of the program for secondary schools and for special schools. Two Type 2 hybrid effectiveness-implementation trials were conducted nationally in secondary schools and special schools (2022-2025). Dissemination strategies and outcomes (reach, website engagement, adoption) were also evaluated across implementation trials. Equity at scale and effectiveness of dissemination strategies were also examined.

Results: The 4-arm RCT (n=20 primary schools; ~600 students) significantly reduced sedentary time (~60mins) and increased physical activity (~5mins), relative to controls. When tested at scale (n=40 schools; n= 1218 students) there were no significant intervention effects. Collaborating with 17 external partner organisations the implementation trial reached 462 primary schools and 1,176 teachers registered in Victoria, with no differences in school socioeconomic status for adopting versus non-adopting schools. Seven secondary schools (n=205 students) and five special schools (n=68 students) participated in respective effectiveness trials (analysis of outcomes is in progress). For implementation at scale, collaborating with 16 external partner organisations nationally, 10 dissemination strategies were identified, including promotion via mass media (33%, 110 person-hours), development of educational materials (21%, 48 person-hours), and maintaining partner engagement (12%, 20 person-hours). A total of n=137 teachers across Australia registered for the secondary school program in the implementation trial. In total the TransformUs program is currently reaching n=887 schools nationwide.

Conclusion: Major challenges have included lack of effectiveness at scale, difficulties in assessment of implementation (both for effectiveness and implementation at scale), and the lack of evidence of effective dissemination strategies. Future research should examine effectiveness of different dissemination and implementation strategies, and use of digital technologies to assess implementation. Next steps are to explore vertical scale up and sustainment at the system level.

S.1.06-2

The PACO School-based Cycling Intervention in Spanish Adolescents: Beyond Changing the Mode of Commuting

P. Campos-Garzón¹, F.J. Huertas Delgado², C. Cadenas-Sanchez², J. Molina-García³, Y. Barranco-Ruiz², P. Chillón²

¹Karolinska Institutet, Global Public Health, Stockholm, Sweden, ²University of Granada, Granada, Spain, ³University of Valencia, Valencia, Spain

S.1.06 Motivation and behavior change -: School-Based Interventions to Promote Physical Activity: Thorns and Roses

Room 5, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: To examine the effects of a school-based cycling intervention on adolescents' usual mode and frequency of active commuting to/from school (ACS), as well as ACS-related psychosocial outcomes.

Methods: A cluster-randomized controlled trial was conducted in eight Spanish secondary schools as part of the PACO study. A total of 256 adolescents (53.1% girls; 14.4±0.6 years) participated. The four-week intervention (one session/week) followed the Bikeability methodology, including theoretical lessons, closed-circuit cycling practice, urban-circuit cycling practice, and bicycle's Party. Outcomes were assessed at baseline and immediately post-intervention. Usual mode of commuting, frequency of ACS, and psychosocial outcomes (perceived barriers, basic psychosocial needs, and motivation) were measured using validated ACS-specific questionnaires. Data were analyzed following an intention-to-treat approach with mixed models, adjusting for gender, socioeconomic status (SES), distance to school, and bike availability. Additionally, per-protocol and moderation analyses were conducted to explore potential effects of gender and SES.

Results: No significant group-by-time differences were observed for the usual mode or frequency of ACS, or for psychosocial outcomes. However, participants in the intervention group reported higher perceived environmental/safety barriers compared with the control group ($\Delta=0.22$, $p=0.041$). Moderation analyses in the ITT indicated greater amotivation among girls in the intervention group ($\Delta=0.54$, $p=0.018$) compared with their peers in the control group. Per-protocol results also showed greater external motivation ($\Delta=0.38$, $p=0.037$) and amotivation ($\Delta=0.45$, $p=0.030$) in the intervention group compared with the control group. The moderation analyses of the per-protocol revealed that girls reported higher environmental/safety barriers ($\Delta=0.40$, $p=0.029$) and external motivation ($\Delta=0.47$, $p=0.047$), while high-SES adolescents reported higher environmental/safety ($\Delta=0.47$, $p=0.010$), planning/psychosocial barriers ($\Delta=0.40$, $p=0.028$), and amotivation ($\Delta=0.54$, $p=0.047$) compared with their peers in the control group.

SYMPOSIUM

Conclusion: The school-based cycling intervention did not produce change in the commuting behavior. However, it increased perceived environmental/safety barriers, especially for girls in the intervention group, exhibiting higher amotivation. Per-protocol analyses also revealed increases in external motivation and perceived barriers, particularly among girls and high-SES adolescents. These findings suggest that short, skills-based cycling interventions can effectively highlight motivational and environmental challenges, representing an initial step toward long-term behavior change when combined with broader environmental and structural support.

S.1.06-3

When an Intervention Isn't an Intervention: Challenges of Evaluating Partner-designed Whole-school Physical Activity Promotion Programmes

S. Fairclough¹

¹Edge Hill University, Sport, Physical Activity, Health, and Wellbeing Research Group, Dept. Sport and Physical Activity, Ormskirk, United Kingdom

S.1.06 Motivation and behavior change -: School-Based Interventions to Promote Physical Activity: Thorns and Roses

Room 5, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: This presentation aims to highlight the challenges of working with funding partners and schools to design, implement, and disseminate school-based physical activity interventions. It will highlight the tensions which can occur between research rigour and the desire from schools and funders to implement interventions quickly to enhance and inform school-level practices and policies.

Methods: Previously published school-based physical activity interventions will be introduced and discussed to highlight key elements of rigorous intervention design, implementation, and reporting which align to the MRC framework for complex interventions. These will be contrasted with an example of a funder- and school-led programme which did not meet the research definition of an intervention, even though some researcher input and research methods were applied to produce data.

Results: Intervention feasibility and effectiveness data will be summarised to demonstrate how key intervention elements were central to the published studies. Longitudinal physical activity data from the funder- and schools-led programme will be presented and discussed to highlight the tension between the need to deploy funds based on current needs and a desire for quick results to see 'impact', and rigorous intervention design considerations, such as having control groups.

Conclusion: This presentation provides contrasting examples of the challenges of school-based physical activity interventions designed to varying degrees by researchers, funding partners and/or schools. In an ideal world researchers, partners/funders, and schools would be involved together at all stages of intervention planning, delivery, and dissemination, but in reality this is not always the case. Recognising and understanding the 'thorny' issues raised will hopefully help researchers and schools to work together to develop interventions that are rigorous as well as timely and impactful.

S.1.07-1

A Decade of Change: The Legacy and Global Vision behind the 2025 Position Statement on Active Outdoor Play

M. Tremblay¹, E.-Y. Lee², L. de Lannoy³

¹CHEO Research Institute, Ottawa, Canada, ²Yonsei University, Department of Sport Industry, Seoul, Korea, Republic of,

³Outdoor Play Canada, Ottawa, Canada

S.1.07 Systems Science: From Vision to Impact: The 2025 Position Statement on Active Outdoor Play

Room 6, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: The 2015 Position Statement on Active Outdoor Play marked a pivotal moment in recognizing children's right to play freely outdoors as essential to their healthy growth and development. In the decade since, the global landscape has shifted dramatically—shaped by the climate crisis, the COVID-19 pandemic, digitalization, urbanization,

and widening inequities. These profound societal transformations called for a renewed and expanded statement reflecting the growing evidence base, evolving priorities, and global calls to action linking active outdoor play, health equity, and planetary health.

Methods: A three-person executive team was formed to guide the update process, comprising representatives from academia, practice, and policy: Dr. Louise de Lannoy (Outdoor Play Canada), Dr. Eun-Young Lee (Yonsei University/Queen's University), and Dr. Mark Tremblay (CHEO Research Institute). Building on the legacy of the 2015 statement and the subsequent establishment of a not-for-profit organization, Outdoor Play Canada, the group led an iterative and consultative process to convene an 11-person international leadership group tasked with updating the original statement in celebration of its 10-year anniversary.

Results: The initial discussion of the need for an update revealed several areas where the 2015 statement no longer reflected the complexity of contemporary realities. Emerging themes included equity and inclusivity for people of all abilities, the influence of digital technology on active outdoor play, and the need to address active outdoor play within increasingly urbanized and climate-impacted environments. Consequently, the updated framework broadened its focus from a child-centered approach to a life-course perspective, positioning active outdoor play as a shared human experience vital to not just individual well-being but also for community and planetary health.

Conclusion: Updating the 2015 Position Statement on Active Outdoor Play was necessary to preserve its legacy but also to extend its relevance for the next decade. The 2025 statement redefines active outdoor play as a foundation for lifelong holistic well-being, connected societies, and planetary health, offering a roadmap for policy and practice that recognizes active outdoor play as a fundamental right and our collective responsibility for all generations.

S.1.07-2

Turning Evidence into Action: Outcomes and Insights from the 2025 Active Outdoor Play Statement

E.-Y. Lee^{1,2}, L. de Lannoy³, M. Tremblay⁴

¹Yonsei University, Seoul, Korea, Republic of, ²Queen's University, Kingston, Canada, ³Outdoor Play Canada, Ottawa, Canada, ⁴Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada

S.1.07 Systems Science: From Vision to Impact: The 2025 Position Statement on Active Outdoor Play
Room 6, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: In 2015, the Position Statement on Active Outdoor Play was released in Canada, emphasizing the critical role of active outdoor play—with its risks—in fostering children's healthy development. Building on this foundation, a 10-year update of the Position Statement on Active Outdoor Play (AOP10) was initiated to broaden its scope and impact, by encompassing all age groups and extending its reach conceptually and globally. Here we explain and present the new 2025 Position Statement.

Methods: Development of the 2025 Position Statement was informed by 18 rigorous literature reviews, a series of leadership group meetings, three rounds of draft AOP10 surveys, followed by extensive communication, translation, production, and dissemination activities.

Results: The 2025 Position Statement on Active Outdoor Play states: "Active outdoor play promotes holistic health and well-being for people of all ages, communities, and environments, and for our entire planet. It is critical given the multiple global challenges we face today (e.g., social and health inequities, climate change and digital addiction). Together, as a collective of the outdoor play sector, we recommend increasing opportunities for active outdoor play in all settings where people live, learn, work, and play. To achieve this, it is important to collaborate across sectors, settings, and societies to preserve, promote, and value equitable access to active play outdoors and in nature." We also provide key evidence pertaining to the nine core themes that informed the development of the 2025 Position Statement and offer recommendations across sectors, calling for multi-sectoral, multi-level actions and collaborations. Across all three survey rounds, responses indicated strong support for the 2025 Position Statement and its supporting content (Round 3: 93–98%). Comprehensive, proactive knowledge translation and dissemination plans were executed to maximize the reach and impact of the 2025 Position Statement.

Conclusion: The 2025 Position Statement calls for systemic changes that prioritize equitable access to active outdoor play opportunities and aims to create healthier communities and a healthier planet. Achieved through international collaboration and consensus, the 2025 Position Statement aspires to connect, advise, inspire, and activate active outdoor play worldwide.

SYMPOSIUM

S.1.07-3

Mobilizing a Movement: Global Knowledge Translation for the 2025 Position Statement on Active Outdoor Play

L. de Lannoy¹

¹*Outdoor Play Canada, Ottawa, Canada*

S.1.07 Systems Science: From Vision to Impact: The 2025 Position Statement on Active Outdoor Play
Room 6, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: To advance the global reach and practical uptake of the 2025 Position Statement on Active Outdoor Play, Outdoor Play Canada implemented a comprehensive suite of knowledge translation (KT) activities designed to bridge research, policy, and practice. These KT activities were structured to ensure accessibility, uptake, and mobilization of evidence across age groups, sectors, cultures and geographies.

Methods: Key KT strategies included the development and dissemination of multi-format resources, incorporating multilingual and multicultural translation invites. A public-facing toolkit including infographics, a slide deck, a whiteboard video and summary webinar was created to support uptake by diverse audiences. An endorsement mechanism was also launched, enabling individuals and organizations worldwide to register support, thus promoting the Position Statement's legitimacy, dissemination network and social mobilization. Implementation-oriented KT steps included tailoring the slide deck and whiteboard video for use in webinars, conference sessions, classroom settings and organisational briefings.

Results: The full Statement is available in all six official UN languages to enable global engagement and context-relevant adaptation. Publications underpinning the Statement, 12 systematic reviews, six global/regional reviews and two dedicated manuscripts, were made

publicly available to ensure transparency and to provide a knowledge base for users. The toolkit's assets are explicitly offered for free, reflecting a strategic commitment to lowering barriers to uptake and supporting multiplier effects in local adaptation and action planning. The slide deck and whiteboard video are also available to facilitate knowledge translation into training, curriculum, professional development and organizational strategy. To date, 578 supporters from over 60 countries have endorsed the Statement and the slide deck and related materials have been used by the AOP10 leadership group and steering committee members in over 20 presentations across 8 countries. To date, the Statement gained 584 endorsements, 173 media hits with 16.2M impressions, and global translation into 12 languages.

Conclusion: Through this layered and resource-rich KT framework, Outdoor Play Canada positions the 2025 Statement not merely as a static document, but as a living catalyst for change—enabling global citizens to play and thrive outdoors, and to act as stewards of land, water, air and each other for planetary health.

S.1.08 Cancer prevention and management: From development to evaluation: building robust remotely-delivered interventions designed to improve activity behaviours among people living with and beyond cancer
Room 7, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: This work had two purposes. First, exploring goals, needs, and preferences for remote rehabilitation among older adults with cancer, and understanding allied/healthcare professionals (A/HCPs) views of delivering this type of rehabilitation. Secondly, understanding practical needs for a smartphone-based rehabilitation app and conducting user testing.

Methods: Intervention Mapping guided our process. Previous work (systematic review (Forbes et al, 2020); qualitative interviews (Swan et al, 2021)) highlighted gaps in knowledge (step 1). Here we report findings for step 2, identifying outcomes and objectives. The target sample was 30 people with a history of cancer (10 each for ages 65-74, 75-84, 85+) for qualitative interviews, and 20 A/HCPs for focus groups. Patient participants were recruited via community

groups or in clinic; A/HCPs were directly invited. Previous interview participants with access to an iPhone or iPad (prototype at the time worked in Apple operating software (iOS)) were invited to user testing. Interviews/user testing were conducted either face-to-face or online. Focus groups were online. All sessions were recorded, transcribed verbatim, coded, and analysed for themes.

Results: Twenty-four patient interviews were completed (65-74 n=14; 75-84 n=10; 85+ n=0). Eight A/HCPs participated in focus groups (n=4 per group). Four people conducted user testing. Most patient participants were fairly confident using an app-based programme and many highlighted potential convenience and accessibility. Both patients and clinicians wanted simple, straightforward designs with clear instructions and reporting functions. Patients and clinicians also reported potential barriers and facilitators for activity in general. The clinician group felt symptom reporting would be very helpful to identify those needing clinical intervention sooner and that social support might be useful. Three of four testers were able to complete testing without many difficulties. App design and functionality was positively viewed overall. Technology confidence was impacted more by previous tech experience than age.

Conclusion: Older adults with cancer welcome proactive, clear and instructive information for cancer rehabilitation in app or non-app form. Making cancer rehabilitation easily accessible and available to people outside of a supervised setting could help bridge the gap between more effective, yet costly, supervised programmes and less effective unsupervised programmes.

Feasibility and Acceptability of ExerciseGuideUK for Those Living with and beyond Lung Cancer: A Mixed Methods Study

J. Curry¹, M. Pearson¹, C. Short², C. Vandelanotte³, H. Evans⁴, M. Lind⁵, C. Forbes¹

¹University of Hull, Hull York Medical School, Hull, United Kingdom, ²The University of Melbourne, Melbourne Centre for Behaviour Change, Melbourne School of Psychological Science, Parkville, Australia, ³Central Queensland University, Appleton Institute, North Rockhampton, Australia, ⁴Flinders University, School of Medicine, College of Nursing and Health Sciences, Bedford, Australia, ⁵Queen's Centre for Oncology and Haematology, Academic Department of Oncology, Hull, United Kingdom

S.1.08 Cancer prevention and management: From development to evaluation: building robust remotely-delivered interventions designed to improve activity behaviours among people living with and beyond cancer

Room 7, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Remotely delivered physical activity interventions have emerged as scalable approaches to support individuals living with and beyond cancer, yet feasibility and engagement challenges persist, particularly among those with treatment-related fatigue and digital literacy barriers. This study examined the feasibility and acceptability of ExerciseGuideUK, a web-based, personalised physical activity and health and lifestyle education intervention designed for individuals living with and beyond lung cancer.

Methods: A single-arm, mixed-methods feasibility study was conducted with participants recruited from oncology clinics in Northern England. Participants engaged with ExerciseGuideUK over eight weeks, receiving tailored aerobic and resistance exercise prescriptions aligned with national and international guidelines, plus behavioural support via goal-setting and self-monitoring modules, combined with virtual one-to-one support. Quantitative outcomes included recruitment, retention, and usability (System Usability Scale; SUS), while qualitative interviews explored experiences using the Theoretical Framework of Acceptability. Data were integrated using the Pillar Integration Process to identify convergent themes.

Results: Eighteen participants (mean age = 65 ± 14 years; 56% male) enrolled, with 77% completing the program. Recruitment was 30.5%, constrained by treatment side effects and limited digital literacy. Average SUS was 72%, indicating good usability. Participants valued flexibility, goal-setting, and progression features, reporting improvements in breathlessness management, confidence, and daily activity habits. However, digital access issues and fatigue limited reach. Integration of quantitative and qualitative data revealed high perceived benefit, low intervention burden, and strong alignment with personal health values.

Conclusion: ExerciseGuideUK demonstrated high acceptability and moderate feasibility as a remotely delivered physical activity and health behaviour intervention for those living with and beyond lung cancer. While participants reported meaningful physical and psychological benefits, digital literacy and symptom burden remain barriers to wider implementation. Future work should evaluate hybrid models combining remote delivery with tailored in-person or telephone support to promote equitable access and sustained engagement across diverse cancer populations. These findings underscore the promise of scalable, patient-centred digital interventions in enhancing cancer survivorship care.

Effects of a Remotely-delivered Intervention for Reducing Sedentary Behaviour among Prostate Cancer Survivors: A Randomized Controlled Trial

L. Trinh¹, C.M. Sabiston¹, S.M.H. Alibhai², K. Campbell³, K.P. Arbour-Nicitopoulos¹, D. Santa Mina¹, J.M. Jones⁴, G. Faulkner⁵

¹University of Toronto, Faculty of Kinesiology and Physical Education, Toronto, Canada, ²Toronto General Research Institute, Toronto, Canada, ³University of British Columbia, Department of Physical Therapy, Vancouver, Canada, ⁴Princess Margaret Cancer Centre, Department of Supportive Care, Toronto, Canada, ⁵University of British Columbia, School of Kinesiology, Vancouver, Canada

S.1.08 Cancer prevention and management: From development to evaluation: building robust remotely-delivered interventions designed to improve activity behaviours among people living with and beyond cancer

Room 7, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Quality and engaging supportive care programs are needed in prostate cancer survivors (PCS) to reduce the chronic and late effects of cancer and its treatment (e.g., fatigue). Independent of physical activity (PA), high volumes of sedentary behavior (SED) are associated with elevated all-cause and cancer mortality, and poorer cancer-specific quality of life (QoL). Simultaneously increasing PA and decreasing SED may be an effective health promotion strategy. Given the barriers to engaging in supervised programs, there is a need to implement remotely-delivered approaches for behavior change. The primary objective was to determine the effects of a 12-week, remotely-delivered intervention (Fitbit + behavioral counselling) vs. Fitbit-only control group in reducing SED among PCS.

Methods: This two-armed, randomized controlled trial recruited 124 inactive PCS (stage I-IV) across Canada who self-report engaging in >8 hours/day of SED. Participants were randomized to the intervention (n=64; Fitbit and behavioral support) or active control group (n=60; Fitbit-only). The intervention consisted of a Fitbit and a series of six behavioral support sessions (based on the M-PAC; two group, four individual sessions) in gradually replacing SED with light-intensity PA by increasing daily step counts to 3,000 steps above baseline values. The Fitbit-only control condition received a Fitbit and public health PA resources. The primary outcome was change in SED measured objectively using activPAL inclinometers, collected at baseline, post-intervention, and at 6-month post-intervention. Linear mixed models will be used to model the primary outcome (i.e., SED) at the three time points.

Results: Results are forthcoming as the trial was completed in November 2025. Results will be ready by the conference date. Briefly, PCS (N=124) had a Mage=69.9±7.5 years, 74.7±80.9 months since diagnosis, and body mass index of 27.3±5.6 kg/m². PCS received surgery (60.9%), hormonal therapy (27.1%), and radiation (36.8%), and 77.4% had localized prostate cancer.

Conclusion: Reducing SED and increasing light-intensity PA plays an important, yet often undervalued role in the health and well-being of PCS. This study will create a unique remotely-delivered platform that can be used by clinical and community-based organizations as a low-cost, supportive care tool to improve health outcomes for PCS.

Ghana's Beverage Tax and Beverage Purchasing Decisions and Behaviours among Low-income Households in Accra

C. Delali Amegah¹, G. Adobea Odei Obeng-Amoako¹, S.W. Ng², M. Lambon-Quayefio³, S. Adu-Afarwuah¹

¹University of Ghana, Nutrition, Legon/ Accra, Ghana, ²University of North Carolina at Chapel Hill, Nutrition, Chapel Hill, United States, ³University of Ghana, Economics, Legon/ Accra, Ghana

S.1.09 Policies and environments: Demand- and supply-side responses to mandatory food policies around the world

Room 8, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: This study explored factors influencing water and sweetened beverage (SB) purchasing decisions and behaviours among low-income households (LIHs) in four peri-urban settings of Accra in response to Ghana's Water, Sugary Drinks, Energy Drinks and Juices (WSEJ) tax. Ghana introduced a 17.5% ad valorem tax on bottled water and SBs in 2014; later increased to 20% in 2023 and extended to include fruit and vegetable juices. However, sachet water; packaged in 500ml polyethylene bags heat sealed at both ends, commonly consumed by LIHs was exempted throughout.

Methods: Focus group discussion (FGD), complemented by quantitative cross-sectional data was used to triangulate FGD findings. Four FGDs were conducted in March-April 2025 in Oyarifa, Teiman, Kweiman, and Danfa. Primary shoppers who frequently purchased water and SBs for their households were purposively sampled for the study. The Theory of Planned Behaviour and the Stimulus-Response Model guided the exploration of factors underpinning water and SB purchasing decisions and behaviours. FGD transcripts were thematically analysed in ATLAS.ti, and quantitative data were analysed descriptively in Stata.

Results: Participants (n= 43) were predominantly female (67%), and over half (56%) were 18-35 years. Majority (65%) had attained Junior High School education. Six themes emerged: household water insecurity; water and SB purchasing and consumption; factors influencing purchasing decisions and consumption; knowledge, attitudes, practices related to SB consumption and health risks; awareness and perceptions of the WSEJ tax; and perceptions of taxed versus untaxed SBs and the tax's impact on patronage. Most households (60%) reported water insecurity in the previous four weeks. Sachet water was the main drinking water source (77%) and over half (51%) purchased three or more bags weekly. Taste, convenience, safety, and availability influenced SB preferences, while safety, price, and availability influenced sachet water purchases. Although tax awareness was low (56%), many participants perceived bottled water taxation as unfair and substituted taxed SB with cheaper local SBs.

Conclusion: Findings reveal limited awareness and perceived inequities regarding WSEJ tax among LIH. To improve health and equity outcomes, tax policy adjustments are needed to better align fiscal and public health objectives.

S.1.09-2

Decomposing Consumer and Producer Responses to the Front-of-Pack Warning Labels in Mexico: The Case of Sugar-sweetened Beverages

J.C. Salgado^{1,2}, R. Rodriguez³, L. Pedraza¹, L. Smith Taillie⁴, S. Barquera¹

¹Instituto Nacional de Salud Pública, Centro de Investigación en Nutrición y Salud, Mexico City, Mexico, ²Secretaría de Ciencia, Humanidades, Tecnología e Innovación, Mexico City, Mexico, ³Universidad Nacional Autónoma de México, Instituto de Investigaciones Económicas, Mexico City, Mexico, ⁴University of North Carolina at Chapel Hill, Nutrition, Chapel Hill, United States

S.1.09 Policies and environments: Demand- and supply-side responses to mandatory food policies around the world

Room 8, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Mexicans consume excessive amounts of sugar-sweetened beverages (SSBs), which contribute to population health harms and high healthcare spending. In March 2020, Mexico announced front-of-pack warning labels (FOP-WLs) to discourage the consumption of SSBs and other packaged foods high in calories, sugar, fat, and sodium, with its implementation scheduled for October 2020. FOP-WLs are intended to modify consumer purchase behavior by providing accessible information about the products' content of health-harmful nutrients. Moreover, producers are likely to respond either by reformulating their products or by updating their product portfolio (removing or launching products). This study aims to disentangle the contributions of consumer and producer responses to changes in SSB purchases in terms of sugar.

Methods: Based on a descriptive approach, we decompose the FOP-WL-associated changes in sugar from SSBs into: (1) purchase volume changes, (2) product switching (consumer responses), (3) product reformulation, and (4) product portfolio updates (producer responses). We use monthly SSB purchase data from Kantar Mexico's urban households for 2017-2021, linked to time-varying product nutritional information. We conduct sub-analyses by policy period (announcement and implementation) and by households' socioeconomic status (SES).

Results: In the post-policy period, compared with the pre-policy period, we found a net reduction of 2.5 sugar grams per capita per day in SSBs, equivalent to a 14% reduction from pre-policy levels. Sugar reductions were driven mainly by reformulation, which accounted for about 90%, followed by product portfolio updates, and were marginally offset by consumer behavior. We also found that reformulation mainly occurred during the announcement period, the largest sugar reduction occurred in sodas, and sugar reductions were larger for low-SES households (-17%) than for high-SES households (-13%). Results remained robust when assuming pre-COVID SSB purchase levels.

Conclusion: After FOP-WLs were introduced in Mexico, sugar from SSB purchases declined substantially. Product reformulation is likely the main driver behind these reductions, despite initial concerns that the innovation of the Mexican FOP-WL system targeting non-caloric sweeteners would discourage reformulation. The overlap between the COVID-19 irruption and the FOP-WL policy limits our assessment of consumer behavior, even though we found sugar reductions across all SES households.

What Have We Learned from England's Mandatory Calorie Labelling Policy? An Evidence Synthesis from a Multi-component Evaluation

M. Essman^{1,2}, T. Burgoine², Y. Huang², A. Jones³, M. Polden⁴, E. Robinson³, S. Sharp², R. Smith⁵, M. White², J. Adams²

¹Duke University, World Food Policy Center, Durham, United States, ²Cambridge University, MRC Epidemiology Unit, Cambridge, United Kingdom, ³University of Liverpool, Psychology, Liverpool, United Kingdom, ⁴University of Liverpool, Health & Life Sciences, Liverpool, United Kingdom, ⁵University of Exeter, Medicine & Health, Exeter, United Kingdom

S.1.09 Policies and environments: Demand- and supply-side responses to mandatory food policies around the world

Room 8, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: To synthesise evidence from a multi-component evaluation of England's 2022 mandatory calorie-labelling policy for large out-of-home food outlets (OHFOs), examining its impacts on business practices and consumer behaviour.

Methods: Findings are synthesised from four quantitative studies:

1. A national pre-post audit of ~15,000 menu items before and after implementation across 78 large chains, assessing changes in mean energy per item, food group, and chain type.
2. A point-of-choice audit of 117 large OHFOs evaluating compliance with statutory calorie-labelling requirements.
3. A customer intercept survey (n=6,578) comparing energy purchased and consumed, and self-reported noticing and use of calorie information pre- and post-policy.
4. A multi-country natural experiment using International Food Policy Study data (2019–2022; n≈39,600) assessing changes in noticing and using nutrition information and related behaviours in England versus jurisdictions without menu labelling.

Results: Across regulated businesses, mean energy per menu item declined by 2% (–9 kcal), driven by the removal of higher-calorie items and addition of slightly lower-calorie new items rather than reformulation. Reductions were greatest for burgers (–103 kcal, –11.1%), beverages (–36 kcal, –16.4%), and mains (–30 kcal, –4.2%). The prevalence of OHFOs meeting any compliance criteria increased from 21% pre-policy to 80% post-policy, although only 15% met all display requirements. Customer intercept survey data (n=6,578) from 330 outlets showed that meals purchased averaged approximately 1,000 kcal per meal, well above nationally recommended intake per meal, with no significant change in calories purchased or consumed. In England, the proportion noticing nutrition information rose from 16% in 2020 to 26% in 2022, and those using the information increased from 8% to 13%. The proportion ordering something different also rose from 13% to 18%, while eating-out frequency did not change.

Conclusion: Mandatory calorie labelling in England was followed by measurable supply-side impacts through menu turnover and modest shifts in how consumers engaged with nutrition information, but limited evidence of reformulation and no change in calories purchased. Information disclosure alone may be insufficient to drive large dietary change. Stronger policy mechanisms that encourage reformulation and more directly influence behaviour are likely needed to achieve greater population health impact.

S.1.10-1

Associations of Stepping Patterns and Diabetes, and Implications for Future Physical Activity Guidelines and Policies

R. Pulsford¹

¹University of Exeter, Faculty of Health and Life Science, Exeter, United Kingdom

S.1.10 Policies and environments: How as well as how much. Can evidence for the importance of physical behaviour micro-patterns inform future guidelines and policies? Evidence from the ProPASS Consortium.

Room 9, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Stepping has been associated with reduced risk for type 2 diabetes (T2D), but existing prospective studies focus largely on average stepping volume (steps per day or week) and ignore important differences in how stepping is accumulated. We examined independent associations of stepping volume and within and between day variability, with incident T2D.

Methods: Participants (n=4594, 40-75y) without preexisting T2D from The Maastricht Study wore an activPAL3 accelerometer (6-7 days). Prospective associations of stepping volume (steps/day) with incident T2D were assessed using Cox proportional hazards models with restricted cubic splines, adjusted for age, sex, BMI, education, smoking and diet. Four indices of between-day (i-iii below) and within-day (iv below) stepping pattern were modelled alongside total steps/day. These were: i. proportion of steps accumulated on the 2 most active days (%Active-2days), ii. between-day step count variability (BDV) and iii. inter-daily step count stability (IS), iv. within-day variability in stepping (WDV) (variability in steps/hour). Higher values in %Active-2days, BDV and WDV indicate greater variation in stepping between or within days. Higher IS values indicate greater uniformity in hourly stepping pattern between days.

Results: Over 30,336 person-years of follow-up (mean 6.6y), 178 incident cases of T2D were recorded. A non-linear association was observed between stepping volume and T2D risk, with steeper risk reduction earlier in the steps/day distribution. Relative to accumulating ≤ 5000 steps/day, adjusted hazard ratios (95% CI) were 0.57 (0.34, 0.96) for 5000-7500 steps/day, 0.60 (0.65-0.94) for 7501-10000 steps/day, 0.48 (0.25, 0.89) for 10001-12500 steps/day and 0.68 (0.37, 1.24) for >12501 steps/day. Notably, higher %Active-2days, BDV, and lower IS, cumulatively describing a variable activity pattern, were linearly associated with T2D risk independent of stepping volume. HRs per SD increase were: %Active-2days 0.70 (0.65, 0.97), BDV 0.69 (0.54, 0.89) and IS 1.32 (1.08, 1.63).

Conclusion: A greater daily stepping volume can reduce T2D risk. Further, accumulating steps in a pattern reflecting periodic larger doses of stepping may provide additional reductions in T2D risk. Future research regarding volume and optimum patterns of stepping could form the basis of the next generation of public health guidance and interventions to improve health through movement.

S.1.10-2

Step Accumulation Patterns and Cardiovascular and Mortality Risk among Suboptimally Active Adults

B. del Pozo Cruz¹

¹Universidad Europea de Madrid, Sport Sciences, Faculty of Medicine, Health, and Sports, Madrid, Spain

S.1.10 Policies and environments: How as well as how much. Can evidence for the importance of physical behaviour micro-patterns inform future guidelines and policies? Evidence from the ProPASS Consortium.

Room 9, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Daily steps are an increasingly adopted metric in physical activity surveillance and public health guidelines. However, it remains unclear whether the way steps are accumulated—through short versus sustained bouts—modifies associations with major health outcomes. This study examined whether step accumulation patterns were associated with all-cause mortality and cardiovascular disease (CVD) incidence among suboptimally active adults.

Methods: We included 33,560 UK Biobank participants (mean age = 62 years; 41% men) with accelerometer-assessed physical activity between 2013–2015 and <8000 daily steps, free of CVD and cancer at baseline. Participants were categorized based on the stepping bout in which they accumulated most of their daily steps: <5 min, 5– <10 min, 10– <15 min, or ≥ 15 min. All-cause mortality and incident CVD were ascertained through national health registries up to 2022. Inverse probability weighting and modified Poisson regression estimated cumulative, relative, and absolute risk differences across categories.

Results: Over a mean follow-up of 7.9 years (266,283 person-years), 735 deaths and 3,119 CVD events occurred. Cumulative all-cause mortality at 9.5 years decreased across increasing bout durations: <5 min, 4.36% (95% CI 3.52–5.19%); 5– <10 min, 1.83% (1.29–2.36%); 10– <15 min, 0.84% (0.13–1.53%); and ≥ 15 min, 0.80% (0.00–1.89%). CVD incidence followed a similar gradient: 13.03%, 11.09%, 7.71%, and 4.39%, respectively. Compared with bouts <5 min, accumulating most steps in ≥ 15 min bouts was associated with 83% and 68% lower relative risk for mortality and CVD, respectively. Associations were strongest among sedentary participants (<5000 steps/day). Sensitivity analyses excluding early events, frailty, and poor health yielded consistent results.

Conclusion: Among adults engaging in fewer than 8000 daily steps, those who accumulated most of their steps in longer, continuous bouts had markedly lower risks of all-cause mortality and CVD. These findings suggest that not only *how much* we walk but also *how* we accumulate steps matters for health. Encouraging longer, uninterrupted walking bouts—especially among the least active—could enhance the preventive potential of step-based physical activity guidance and inform future public health recommendations.

S.1.10-3

Device-measured Sleep Characteristics, Daily Step Count, and Cardiometabolic Health Markers: Findings from the Prospective Physical Activity, Sitting, and Sleep (ProPASS) Consortium

A. Koster¹, W. Bian², The ProPASS Collaboration

¹Maastricht University, Social Medicine, Maastricht, Netherlands, ²University of Sydney, Faculty of Medicine and Health, School of Health Sciences, Sydney, Australia

S.1.10 Policies and environments: How as well as how much. Can evidence for the importance of physical behaviour micro-patterns inform future guidelines and policies? Evidence from the ProPASS Consortium.

Room 9, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Sleep and physical activity (PA) are critical for cardiometabolic health, yet evidence on the independent and combined associations of device-measured sleep parameters and PA remains limited. We present two studies examining (1) the independent and joint associations of sleep duration, regularity, and efficiency with cardiometabolic health, and (2) joint association of sleep patterns (duration, regularity) and step count with cardiometabolic outcomes in adults.

Methods: Cross-sectional data from six cohorts (n=14,085 participants) from the Prospective Physical Activity, Sitting and Sleep (ProPASS) consortium were used. Total daily step count (steps/day), sleep duration (short: <7 h/day; adequate: 7-8 h/day; long: >8 h/day), sleep regularity index as a measure of day-to-day variability in sleep-wake patterns (regular: >87.3%; slightly irregular: 71.6-87.3%; irregular: <71.6%), and sleep efficiency as the ratio of total sleep time to total time in bed (high: >91.8%, medium: 85.3-91.8%, low: <85.3%). Cardiometabolic health markers included BMI, waist circumference, HDL and LDL cholesterol, glycated haemoglobin, systolic and diastolic blood pressure, and a composite cardiometabolic risk z-score was computed.

Results: In study 1 we show that short sleep duration (β : 0.05, 95%CI: 0.03-0.07), an irregular sleep pattern (β : 0.14, 95%CI: 0.11-0.18), and low sleep efficiency (β : 0.10, 95%CI: 0.07-0.13) were associated with a higher cardiometabolic risk compared to optimal sleep. The joint analysis shows that individuals with an irregular and low sleep efficiency, regardless of sleep duration, had worse cardiometabolic health (in long sleepers: β : 0.21, 95%CI: 0.15-0.28; in adequate sleepers: β : 0.23, 95%CI: 0.16-0.30; in short sleepers: β : 0.28, 95%CI: 0.22-0.35) compared to adequate, regular and highly efficient sleepers. In study 2 we show that lower PA (<8475 steps/day) combined with either lower sleep regularity or short sleep duration was associated with the least favourable cardiometabolic health. The corresponding z-scores were β : 0.34 (95%CI: 0.30-0.38) and β : 0.26 (95%CI: 0.22-0.31), compared to those with optimal sleep and high step count (>11553 steps/day).

Conclusion: Our findings suggests that sleep regularity and efficiency are important for cardiometabolic health beyond sleep duration, and low PA may worsen the adverse effects of irregular or short sleep. Future longitudinal studies should jointly evaluate multidimensional sleep indices and PA to better understand their combined health impacts across diverse populations.

S.1.11-1

Exploring the Role of Chamas in Economic Resilience, Food Security and Urban Foodsystems in Kenya

C. Obonyo¹, L. Atieno¹, C. Lwanga¹, G. Odhiambo¹, V. Were¹, L. Foley²

¹Kenya Medical Research Institute (KEMRI), Kisumu, Kenya, ²University of Cambridge, MRC Epidemiology Unit, Cambridge, United Kingdom

S.1.11 Motivation and behavior change: Savings for Health: Informal Savings Groups as a Platform Promoting Economic Resilience, Food Security, Food Sovereignty and Healthy Food Consumption in Urban African Food Systems Multipurpose Room, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: To explore the complex role of chamas in household economic resilience, household food security and local food systems, and to understand the equity implications for disadvantaged groups, in an urban Kenyan setting.

Methods: In 2024/25 we conducted a mixed-methods cross-sectional study in Kisumu, Kenya, consisting of: a quantitative survey of 201 households; five focus groups with chama members (8-10 participants, predominantly

women); and 20 key informant interviews with local government and community stakeholders relevant to chamas.

Results: The household survey indicated that more than two thirds of households were severely food insecure. Food insecurity was more common in poor households and those with lower education levels. We found a small protective association between chama membership and lower food insecurity, but this was not statistically significant. However, in focus groups, chamas were seen as important catalysts for food security through collective food purchasing, food stocking and budget management, and through jointly developing and maintaining kitchen gardens. “In the same chama, we have a kitchen garden where we grow vegetables in containers. So, a member can volunteer to water the vegetables if there are no rains. So, when the vegetables are ripe, you can harvest because the garden is yours. In case you have surplus, you can sell. Every member has the kitchen garden.” More broadly, chamas were considered key social infrastructure that supported gendered empowerment. In interviews, stakeholders described how chamas directly strengthened local food systems through involvement in food production, value addition and distribution. Many groups collectively engaged in local, climate-resilient agroecology and agribusiness practices. Though chamas are an informal social innovation, stakeholders saw an important role for collaboration with the formal sector, particularly local government and business.

Conclusion: Chamas are not just savings schemes - they are living laboratories of social innovation. Our study indicated that chamas play a key role in household food security and sustainable local food systems, while being an important vehicle for financial inclusion and empowerment. With supportive policy, capacity building, research, and financing they could evolve into powerful engines for health equity and community transformation.

S.1.11-2

Ukongela Ubomi (Savings for Life): Women-led Informal Savings Groups Promoting Food Security and Healthy Food Consumption, A Novel Approach

O. Alaba^{1,2}, Z. Albertyn-Blanchard¹, F. Wayas¹, M. Bhebe^{1,2}, F. Hoosen¹, D. Okova², J. Blanchard³, E.V. Lambert^{1,4,5}

¹University of Cape Town, Research Centre for Health through Physical Activity, Lifestyle and Sport (HPALS), Faculty of Health Sciences, Cape Town, South Africa, ²University of Cape Town, Health Economics Unit, School of Public Health, Cape Town, South Africa, ³South African Military Health Services Area Military Health Unit, Cape Town, South Africa, ⁴University of Southern Queensland, School of Health and Medical Sciences, Faculty of Health, Engineering and Sciences, Ipswich, Australia, ⁵Rhodes University, Human Kinetics and Ergonomics, Makhanda, South Africa

S.1.11 Motivation and behavior change: Savings for Health: Informal Savings Groups as a Platform Promoting Economic Resilience, Food Security, Food Sovereignty and Healthy Food Consumption in Urban African Food Systems Multipurpose Room, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Women from low-income communities are disproportionately affected by food insecurity and obesity. Informal savings groups (ISGs) are found in almost every LMIC (stokvels in South Africa), and through which the combined funds of monthly contributions help to address household food insecurity, but not healthy food procurement. We designed an intervention to mitigate barriers to access for fresh produce, through last-mile distribution (LMD) or nutrition education through a mobile application, with financial leveraging via collective purchasing with vouchers.

Methods: We recruited 24 stokvels, in three disadvantaged communities in Cape Town, South Africa, each with 8-12 members (N=165), allocated to one of three arms of this quasi-experimental study. All stokvels received vouchers for vegetable/fruit purchases (ZAR2000/month/3months). One group received support for transporting bulk purchases home (LMD); one received access to a bespoke, mobile application (MA) with bi-lingual information regarding nutrition, storage and cost-savings tips and recipes for fresh produce; and one received vouchers only (VO). Measurements included: BMI, household food insecurity (HFIAS), food choice decisions, food frequency (FFQ), and food environments, at baseline and over 3 months. Focus group discussions were held after one and 3 months, to explore impact of interventions on attitudes and priorities regarding vegetable/fruit consumption. We report preliminary findings on FFQ, HFIAS and food choice decisions.

Results: Mean age was 42 yrs, >85% had a high school education, 61% unemployed and >70% had a household (HH) income of 60%. Food choice was influenced by health (65%), tradition (67%) and “so that the family does not experience hunger” (77%). HFIAS decreased significantly ($P<0.003$) in all groups from baseline to the first month after receiving vouchers, however, effect size for this reduction was lowest (0.55 ± 0.29) in the VO group, compared to the MA (1.04 ± 0.20) and LMD groups (2.07 ± 10.24). Citrus intake increased in all groups, by as much as 80% in the LMD group. Tomato consumption nearly doubled in the LMD group, and potato consumption increased in all. There were no compensatory increases in sugary beverage intake.

Conclusion: By resolving logistical and financial barriers for access to healthy, affordable food, including as little as

SYMPOSIUM

ZAR200/per HH/per month, or overcoming LMD, stokvels can drastically reduce HFIAS. These results may be used to inform policy and government initiatives.

S.1.11 Motivation and behavior change: Savings for Health: Informal Savings Groups as a Platform Promoting Economic Resilience, Food Security, Food Sovereignty and Healthy Food Consumption in Urban African Food Systems Multipurpose Room, May 28, 2026, 8:00 AM - 9:00 AM

Purpose: Our quasi-experimental study explores how access to fresh food and knowledge influence food purchasing behavior (FPB). Building on work with informal savings groups, known as stokvels in South Africa, we designed an intervention to mitigate fresh produce barriers through last-mile distribution, nutrition education, and financial leveraging via collective purchasing with vouchers. We aimed to measure changes in practices and priorities for fresh produce procurement and consumption.
